6. { G. E. Stanley (3½ Singer) ...	34½s.
{ H. W. Hands (8 Williamson) ...	

*Results on Formula.*

	Fig. of merit.
1. P. Weatherilt (2½ Zenith) ...	146
2. J. Cocker (2½ Singer) ...	154
3. S. L. Bailey (2½ Douglas) ...	156
4. F. G. Edmond (2 Humber) ...	175
5. J. W. Woodhouse (3½ Regal-Precision) ...	178
6. R. Holloway (3½ Premier) ...	186

**CLASS VII.**—Members' Class (sealed handicap). First prize, Committee Cup; second, club prize. In this event Mr. Edward Lycett's prize was offered for the best performance by a member who had never won a prize in a hill-climb.

The members' class only necessitated four ascents, the remainder of the nineteen competitors having recorded their times in the previous events.

**CLASS VII.**

	Actual time.
1. Reg. Holloway (3½ Premier) ...	35s.
2. H. Green (3½ Triumph) ...	36½s.
3. S. L. Bailey (2½ Douglas) ...	38s.
4. F. S. Whitworth (2½ Douglas) ...	40½s.
5. J. Dudley (2½ Hobart) ...	42s.
6. W. Williamson (2½ Douglas) ...	44½s.

The seven events took 2h. 25m. to run off, so there was no flagging of interest throughout, and the contest was not long enough to become boring.

**SUCCESSFUL RIDERS AT THE COVENTRY HILL-CLIMB AT DODFORD LAST SATURDAY.**

G. E. Stanley (2½ h.p. Singer). Stanley was the most successful rider.

Harry Reed (8 h.p. Dot-Jap), who made fastest time of the day averaging 45 m.p.h.

## Coventry Club's Open Hill-climb.—

The results of two classes were announced almost immediately at the Wheatsheaf Hotel, Daventry, and every class winner was posted by 6 p.m., so that competitors and spectators were mostly home before dark, having seen the biggest hill-climb ever arranged, and, what is more significant still, being in possession of the results.

Six teams competed for the special team prize, viz., Douglas, Williamson, Zenith, Rudge, Corab, and Colmore Depot teams. The result was:

1, Douglas Team, W. W. Douglas (2½ h.p. Douglas), F.

Ball (2¾ h.p. Douglas), and E. Kickham (2¾ h.p. Douglas). Aggregate figure of merit, 554.

2, Zenith Team, F. W. Barnes (2½ h.p. Zenith), P. Weatherill (3½ h.p. Zenith), and E. B. Ware (3½ h.p. Zenith). Aggregate figure of merit, 543.

3, Colmore Depot Team, R. Holloway (2½ h.p. Premier), S. L. Bailey (2¾ h.p. Douglas), and H. Cork (3½ h.p. Matchless). Aggregate figure of merit, 544.

The foregoing results are official, and were confirmed by the committee of the Coventry and Warwickshire Motor Club on Monday evening last.

## HOLT'S CANTILEVER SIDECAR.

A Novel Sidecar with Adjustable Hammock Seat capable of being Folded.

(1) Adjusted to suit a short passenger.

(2) Complete sidecar folded when not in use. In this position it can be used as a carrier.

(3) Normal adjustment and child's seat

IN another part of this issue we refer to the failings of many sidecar bodies and the lack of room for odds and ends. On this page we illustrate an entirely new sidecar, the body of which is especially original. This sidecar is the result of two years' experiment on the part of Mr. H. Holt, 68a, Regent Street, Leamington. The illustrations are for the most part self-explanatory, so that a short description will suffice. The seat posts are adjustable along the chassis to give extra leg room, as well as for height. In these posts there are strong springs, in addition to which the seat is supported on other springs which can be clearly seen. The angle of the back (also, of course, adjustable for height) is varied by means of adjustable cables, which consist of steel wires tested to a breaking strain of 2,500 lbs., and covered with celluloid to preserve them from rust. These run over small pulley wheels fixed at each end. The arm rest tubes are telescoped into the seat posts to allow for adjustment, and each is provided with a small pocket which is useful for carrying small

articles, such as gloves, handkerchiefs, etc. The footboard is pivoted in front and swings through a steel plate fastened at the rear, and depends on springs recessed over the downward clip rods.

## Security for the Flexible Back.

The method of fixing the flexible back rest is by means of an iron cross tube drilled with a hole at each end to receive a solid rod, which is first passed through a hem of the material and has right-angled bends at each end; these ends are passed through the holes just mentioned in the cross bar, and the material passed once or twice round holds the whole firmly together. This, of course, is wound up as the height of the back is reduced.

The chassis is constructed throughout with right-angled lugs and 14 gauge tubing, except in the case of the cranked axle, which is designed to bring the wheel of the sidecar and bicycle into proper alignment and the bent front attachment, both of these being 13 gauge to give extra strength. The attachments,

light, strong, and neat, are of the taper type, the sidecar members being each held firmly in place by one nut and spring washer.

A tool box, large enough to contain a spare cover, tube, belt, and tools, or a two-gallon tin of petrol, is in the base of the chassis, held by means of a steel band fastened with two clips at the sides, and a clip behind in the centre of the frame. On the lid of the box a child's seat, set on springs, can be carried, or a spare can of petrol may be strapped.

The mudguard has large wings on the side next the body, which effectually screen the passenger from dirt; a stand and lamp bracket are provided; the end of the front attachment is provided with a security bolt which prevents the sidecar from slipping off if the connections should become loose by any chance. This sidecar is said to be exceptionally light; as we have not had an opportunity of riding in it, however, we are unable to give any account of its running, but it seems to possess, with its universal adjustments, great possibilities of comfort.

(4) Sloping backrest. Apron to cover passenger

(5) Sidecar from the rear. Note the spring head

(6) A family party

# MERSEY M.C. OPEN TRIAL.

**T**HIS open reliability trial was lucky in being run off on Saturday, one of the few really nice days we had in August. At eight o'clock the first of the sixty competitors were started, in pairs, at minute intervals, from Birkenhead, the first pair being the hon. sec., S. W. Carty, and V. E. Horsman, who, like the pairs that followed, had to observe each other and report any stops, any stoppage except for traffic being penalised. About forty solo machines started and sixteen sidecars, one runabout, and a car.

## A Sidecar Frame Breaks.

All went well except for a few punctures till Tarporley, where a sidecar attached to a Clyno was seen with both the rear attachment tubes snapped. Luckily, they were on a good road, and neither were hurt. G. W. Windsor (the driver) was heard to enquire if he could hire a sidecar in Tarporley. He seems to have succeeded, as he came along on Castleton Hill with another attached. There was a stop at

Stone for petrol, then on through Cheadle, and up the noted Oakamoor Hill. This caused a few failures, and further on at five cross roads nearly half the competitors took the wrong road to Ashbourne. Only one direction arrow was to be seen throughout the course. The A.A. scouts and R.A.C. guides rendered good assistance, but chiefly in towns, etc. After the fifty minutes' lunch stop at Ashbourne the riders made for Matlock Bridge, and tackled the noted bank where the cable cars go. Crowds were here to see the fun and cheer the successful ones. About half the number got up. It was a grand competition between variable gears with small engines and large engines with single gears, and the victory was very decidedly with the gears. The Rudge Multi and Zenith-Gradua shone conspicuously. It is strange that nearly eight years ago the first man to get up the bank (J. Edge on a Bat) used a twin pulley and two belts. This time a Matchless 8 h.p. twin had the same on but failed, owing to the sidecar tyre puncturing. The Morgan roared up at a great pace, and turned the bend at the top so fast that the back wheel bent over to about sixty degrees, which must have put a fearful strain on the frame. Later on, after Castleton Hill, in taking a corner too fast it ran up the bank and overturned.

## A Real Hill.

After leaving Matlock the route lay through Bakewell and Hope to Castleton. Here the competitors had to face the worst hill on the run. It proved to be a real terror. Long, loose, and winding, with grooves across every few yards where the rivulets had made tracks, into which the wheels dropped, making it difficult to remain in the saddle. Some riders tried time after time, others got up in two or three instalments. J. M. G. Lamb had to let his wife walk up and come up solo, others ran part of the way. A couple of hundred yards of new loose stones at the top, thinly laid all over the road, was, to some, the last straw.

The run down to Chapel-en-le-Frith was fair till we reached Bollington, where the main road is in a disgraceful state. At Knutsford there was a twenty minutes' stop for tea at the Angel Hotel. Another twenty-six miles through Warrington brought us to the finishing point at Broad Green after 186 miles on all varieties and conditions of roads and hills.

[The results of the trial appear on page 1018.—Ed.]

G. W. Windsor (5-6 h.p. Clyno sidecar) on the top bend of Castleton Hill, Derbyshire.

# NEW CROUCH ENGINE.

**T**HE C.M.C. carettes are now being fitted with a new and improved engine of the company's own manufacture, the bore and stroke of which have been increased to 80 mm. by 90 mm. The cylinders are set at an angle of 60°, and have cast with them valve boxes which are covered by a quickly detachable aluminium plate, thus enclosing the valve mechanism entirely.

As before, an extension piece bolts on to the side of the engine, and serves to enclose the clutch and support the gear box. On the timing gear side of the engine lies a small bevel box containing a pair of gears which drive a shaft at right angles to the crankshaft. This shaft serves to drive the magneto and water pump, which are carried on a special bracket fixed to the crank case. The engine and gear box unit weigh 163 lbs.

The engine made its first public appearance at the Coventry and Warwickshire hill-climb, where it unfortunately failed to do itself justice owing to gross over-lubrication due to the oil tap having been left on. Shortly after the climb, however, having cleared itself of oil, we

were invited by Mr. W. Crouch to try its paces. The engine is possessed of great energy and is extremely flexible. It is almost possible to walk beside the vehicle with the engine firing regularly on top gear, and by sweeping open the throttle the machine will gather speed at a rapid rate to over 40 m.p.h. On hills the legal speed may be maintained.

A cylinder of the new Crouch engine showing the enclosed valves.

The new Crouch engine and gear box unit which scales 163 lbs.

**TIME TO LIGHT LAMPS.**

Sept. 5th	...	7.37 p.m.
" 7th	...	7.33 "
" 9th	...	7.28 "
" 11th	...	7.24 "

**Successes Celebrated.**

A dinner was arranged at Mablethorpe last Saturday in honour of the Nottingham and District M.C.C. winners, Mr. G. Brough (London-Edinburgh Cup), and the team which won *The Motor Cycle Cup* in the M.C.C. Team Trial. Dr. Fredale presided, with Mr. F. W. Dance in the vice-chair, fifty-five being present.

**A 2½ h.p. Sidecar Machine.**

The smallest machine in the passenger class of the Coventry and Warwickshire M.C. hill-climb was the 2½ h.p. three-speed Hazlewood driven by Alec Walsgrove, who was obviously after the formula prize. His total weight was 504 lbs., and the fact that he succeeded in climbing Woodway Hill is a striking instance of what a good engine in combination with a three-speed gear can perform.

**Mersey M.C.C. Open Trial.**

The list of awards in the above trial, described on page 1017, is as follows:

**GOLD MEDAL WINNERS.**

- V. E. Horsman (3½ Singer). Special prize.  
S. W. Carty (3½ Ariel)  
A. J. Mason (3½ Rudge)  
W. Davies (2½ Victoria-Jap)  
T. Heaton (3½ Bradbury)  
E. F. Jenkins (3½ Macbeth)  
G. Hunt (3½ Campion)  
C. L. Scott (3½ Rudge)

The above made non-stop runs.

Marks lost.

- H. G. Dixon (3½ New Hudson) ... 5  
Special prize in sidecar class.  
F. C. Jones (3½ Zenith) ... 5  
A. J. Brewin (8 Zenith) ... 40  
J. Cooke (3½ Triumph) ... 44  
W. H. Longton (3½ Ivy-Precision) ... 50  
J. McG. Lamb (6 Clyno sc.) ... 50  
P. Webster (3½ Rudge) ... 50

**SILVER MEDAL WINNERS.**

- P. Proud (3½ Rudge) ... Non-stop.  
Marks lost.  
H. C. Marston (8 Dot) ... 20  
E. W. Davis (3½ Singer) ... 50  
G. Bennion (3½ Bradbury) ... 50

The above were late at the finish.

- C. P. Jarvis (8 Zenith sc.) ... 53  
H. W. Coopland (7 Williamson sc.) ... 65  
L. Mogridge (3½ Mead-Precision) ... 70  
N. H. Brown (7 Indian sc.) ... 70  
J. D. Nixon (3½ Rudge) ... 70  
A. J. Jenkins (2½ Douglas) ... 70  
A. Cadwallader (2½ Enfield) ... 80  
F. H. Whiteley (2½ Douglas) ... 100

The special lightweight prize-winner is not yet settled.

**Attempt on the End-to-end Sidecar Record.**

We referred last week to a projected attempt on the End-to-end sidecar record by Mr. Elison Hawks, of Leeds. His mount was a Rudge multi fitted with Bates tyres. Weather and insufficient knowledge of the route combined to delay him, and the attempt was given up as hopeless at Preston. The sidecar was fitted with a special racing body.

**Le Grand Prix de France et la Coupe Internationale de Motocyclettes.**

The entries for the above event, to be held next week-end, are more representative than usual, and there should be a fine struggle between the leading French makes and the English machines which are entered. England is represented by Triumph, Rudge, Douglas, Williamson, and New Hudson, and probably Indian and Matchless machines, while against them are ranged such machines as the Griffon, Peugeot, Terrot, Alcyon, Wanderer, and Bedelia, and probably René Gillet. The trial is being conducted by the A.C. de la Sarthe et de l'Onest. On Sunday a course of eighteen kilometres *via* Le Mans-Mulsanne-Ruaudin-Le Mans will have to be covered twenty-two times, making a total of 396 kilometres, and on Monday a different circuit will be followed, bringing the total to 648.

**SPECIAL FEATURES.**

**NEW PASSENGER MACHINES.  
WEEK-END COMPETITIONS.  
OLYMPIA SHOW PLAN.**

**Open Hill-climb at Amulree.**

The Edinburgh and District M.C. will hold an open hill-climb on Amulree Hill, Glenquach, on Monday, the 16th inst., at 1 p.m. There will be eight classes.

**An Unfortunate Collision.**

We are happy to be able to record that G. L. Fletcher, whose accident was reported in our account of the Essex M.C. York and back run, is doing satisfactorily and hopes to be able to return to town this week.

**What a Big Entry Means.**

A certain amount of grumbling was heard at the Coventry and Warwickshire M.C. hill-climb on Saturday last, because competitors were allowed only one ascent of the hill on each machine entered, the time counting throughout. It must, however, be remembered that if all had been allowed to ride in each class the event would have taken at least six hours to run off, and would have continued until dark.

**NOTTINGHAM AND DISTRICT M.C.C. SPEED TRIALS ON MABLETHORPE SANDS.**

The start of the ladies' race. Left to right the riders are Mrs. K. Simpson (Rudge)—the winner—Miss Kettle (Premier), and Miss Shipside (Premier) who is but 16 years of age.

A FRENCH AUTOWHEEL, THE TRACTEUR AMOVIBLE.

A French device for attachment to a push bicycle. It has a Clement 1½ h.p. engine, automatic carburettor, Bosch Magneto, and belt, two small tanks for oil and petrol, steel-studded Michelin non-skid tyre on a wheel 14 in. in diameter. The inventor claims a speed of 20 m.p.h.

#### English-Dutch Trial.

The five Dutch private owners who tied for the P. and M. Cup in the above trial will compete again for the trophy on the 22nd inst.

#### Brooklands T.T. Race.

The postponed 150 miles race of the B.M.C.R.C. will be held on Saturday, September 14th, and will be the only event on the programme for that date. A further limited number of entries can be received up till Saturday next, the 7th inst.

#### Ten Pounds Reward.

£10 reward will be paid by the Auto Cycle Union for information which will lead to the apprehension and conviction of the person or persons who maliciously put sand in the oil tank of Mr. G. L. Fletcher's 2½ h.p. Douglas motor cycle whilst he was competing in the Six Days' Trial.

#### Stolen Machine.

On August 31st, at about 11.30 p.m., a 6 h.p. Zenith and sidecar, 1911 late model, W2337 frame, No. 1086 Mills-Fulford Herald chassis, cane unbleached body, with two new Hutchinson tyres 26in. x 2½in. heavy passenger type on machine, Continental tyre on sidecar, was stolen from Messrs. Tarr and Fox, 7-11, Cemetery Road, Sheffield.

#### Sidecar Track Record again Lowered.

On the 30th ult., Stanhope Spencer attempted a four hours' record with a 3½ h.p. Rudge fitted with a Bramble sidecar on Brooklands track. At the end of the third hour, however, he abandoned his intentions, owing to valve troubles. His failure with regard to the above test did not, however, prevent him, in the meantime, putting up a fresh record for speed during his three consecutive hours' run, the distances covered being as follows: First hour,

46 miles 587 yards; second hour, 86 miles 115 yards; third hour, 126 miles 900 yards, 100 miles being covered in 2h. 16m. 10½s. The previous record for two hours' consecutive running was also put up by this rider in July last, when 80 miles 1,250 yards were covered, 43 miles 35 yards in the first hour and 37 miles 1,215 yards during the second. Previous to Stanhope Spencer's performance last week, there had been no three hours' record.

#### A French Reliability Trial.

The attention of English motor cyclists who are anxious to take part in a competition in France is drawn to the motor cycle reliability trial organised by the T.M.C.F. It will take place on September 29th. The distance is 245 kilometres (about 152½ miles). The course is particularly easy, from Paris to Dourdan (the scene of the International Cup Race in 1905), then to Orleans, and along the valley of the Loire to Tours. The machines will be classified in the usual manner, and on arriving at Tours the competitors will have to cover two laps of the track at the Vélodrome de Tours. Entries should be addressed to Mr. M. R. Desitter, treasurer, 48, Rue du Moscon, Paris. Entries close on Wednesday, September 25th, at 8 p.m.

#### Through the Floods on the Great North Road.

W. Pratt set out on his P. and M. from London to Cleckheaton on Tuesday, the 27th ultimo, but, although he started at 10 a.m., he did not reach Doncaster till 8 p.m., having traversed upwards of 200 miles, the direct distance being 164 miles. He was first warned by an A.A. scout that the road at Alconbury was impassable, the water being up to the windows of the houses. He rode through several watersplashes and shallow floods, but on more than one occasion had to get his machine taken across in a cart; once he had to return on his track as there was no cart to be had. All through he experienced no misfiring, which speaks well for the modern motor cycle and the P. and M., with its well-placed magneto and chain drive, in particular.

MORE RUDGE SIDECAR TRACK RECORDS.

The start of Stanhope Spencer's record ride on a 3½ Rudge sidecar.

Finishing the first hour, in which time he covered 46 miles 587 yards.

# Snaresbrook to York and Back 24 Hours' Ride.

## THE ESSEX MOTOR CLUB'S ANNUAL EVENT.

**S**EVENTEEN riders of motor bicycles, fifteen drivers of sidecar combinations, and two drivers of cyclecars started from the Eagle Hotel, Snaresbrook, on Friday last, at 7 p.m. In the motor cycle class there were only two non-starters. The competition was a closed one, the total distance being 403 miles.

The principal award is the challenge cup presented by the

The words on the route card, "Petrol, coffee, etc., here," denoted a welcome fifteen minutes' stop for replenishments to man and machine. Between Fenstanton and Norman Cross the men entered a section where a secret check might be encountered. At Huntingdon was a known check in charge of Dr. Moss-Blundell. The secret check came soon after, situated at the top of Alconbury Hill. The competitors now entered the flood district, and the remains of the recent inundations were only too clearly evident, especially at Wansford. During the night section the lamps as a whole burnt well, and few cases of lamp trouble were seen. A good supper well served was enjoyed at Grantham, in which town part of the road was up, and a short detour had to be made. During the hour's stop for breakfast at the Windmill Hotel, York, Brassington's (Rex sidette) sidecar tyre blew off the rim with a loud report, much to the amusement of everyone save the owner. The homeward journey was made in excellent weather.

### An Unexpected Meeting.

At Ferrybridge we met Sawyer, Haslam, Dover, and other members of the Sheffield Club, who were taking part in a 160 mile trial, which included Sutton Bank. In Doncaster da Silveria (Indian) fell on the tramlines, and at the finish was numbered among the missing. He had had an accident to his machine before the start, and the fall in Doncaster did further damage, and threw his wheels badly out of track. In Retford especial care had to be exercised in the ten-mile limit, as the police were extremely active. Two retirements have to be reported near Grantham. At Sowerby poor Fletcher, whose little machine had been pulling its unfair load so well that it went three-parts of the way up Wentbridge hill on top speed, collided with a cart which had pulled right across the road in front of him. He was rendered unconscious, and was taken to the Grantham Hospital. Pearson, his passenger, was slightly injured. Howard (Jap) stripped his magneto pinion and was forced to withdraw. In Stamford, Kerr (N.S.U.) ran into a boy and bent his front forks so badly that the tyre was rubbing against the sides, so he applied oil to minimise the friction, and reached home safely. Some consternation was caused near Huntingdon by Dr. Moss-Blundell having moved the check outside the town; at its previous situation, though satisfactory at night, it was impossible by day owing to the congested condition of the streets. The Oryx succeeded in reaching Cambridge, and here E. J. Bass was in charge of the check.

The organisation throughout was excellent. Arrows were placed at all doubtful turnings, A.A. and M.U. scouts lent their aid by night and boy scouts by day. The journey from

A group of competitors outside the control at Grantham.

Triumph Cycle Company for the driver of a motor bicycle or passenger machine who adhered closest to schedule time on the double journey. Gold medals are awarded to those finishing within twenty-four hours with a total error of 10m. or less, silver medals to those finishing in the same period but with a total error not exceeding 25m., and bronze medals to those finishing within 25h.

Having due regard to the recent weather conditions the competitors turned up at Snaresbrook on Friday night prepared for the worst, but evidently Mr. Fuller, who managed the run so well, successfully squared the clerk who is said to control the elements, as the night, though cool, was fine, the moon dispelled the darkness, and a glorious day followed the dawn for the rest of the journey.

### 2½ h.p. Sidecar Outfits.

In the sidecar class the two machines which attracted the greatest attention were Fletcher's 2½ Douglas and Holroyd's 2½ Motosacoche, to which their drivers had had the audacity to attach sidecars. Holroyd had bad luck before the start with a seized big end, but he set matters right, and though he could not compete he rode to Grantham and returned with the rest of the party. Fletcher's Douglas behaved extremely well, and more will be written of his doings later on in this report. R. Lord had Miss Hind as his passenger in his Rex sidette. Once past Woodford the road surface was splendid, and there was no dust; however, greasy patches were met here and there, and near Sanbrieworth some unrolled stones, not marked by any warning light, caused several to dismount. The first check was at Hockerill, and here, as usual, several men had to wait before signing on as they were ahead of time. At this point excessive tyre trouble dogged Mr. Goodchild's Oryx car carrying Mr. E. J. Bass, who was in charge of some of the secret checks. This disaster put a further burden on the shoulders of the indefatigable secretary, Mr. Fuller, and resulted in several of the checks being cut out, as the car could not complete the whole of the run. Near Cambridge some more unrolled stones were encountered, causing Lilley (3½ Singer) to fall. In the University Town a goodly crowd welcomed the arrival of the competitors, who checked in at the Castle Hotel.

The ubiquitous A.A. scout saluting E. Frasseti (7 Indian sidecar) at Barnby Moor Corner

**The Essex Motor Club's Annual Event.—**

Cambridge was devoid of incident. Weather and roads were alike perfect, and the men rode wonderfully close to time, errors of only three minutes being reported in several cases. Those who finished the journey in time were the following: Motor Cycle Class.—A. E. Uffelman (6 Rex-Jap), H. J. Beal (3 N.S.U.), J. H. Kerr (3½ N.S.U.), A. H. Gold (3½ Ariel), P. D. Walker (3½ Rudge), A. V. Deacock (6 N.L.G.), L. G. Brown (3½ Triumph), F. Roberts (3½ Rudge), H. Karslake (3½ Rover), A. A. Lilley (3½ Singer), G. T. Gray (3½ Rudge), N. C. Dear (2½ Douglas), W. E. Rootes (3½ Singer), J. A. Campbell (3½ Rudge), and W. Cooper (3½ Bradbury). Sidecars.—W. C. Hemy (3½ Service), C. F. Michell (6 Bat-Jap), W. H. Wells, E. Frasetti, and B. A. Hill (7 Indians). The latter started a cleaning competition on the way back, and arrived looking the perfection of neatness. G. E. Revill (6 Zenith), A. J. Sproston (3½ Rover), A. E. Brassington (6 Rex sidette), A. T. Stanton (3½ Bradbury), V. Garland (5-6 Clyno), W. K. Smith (7 Indian), R. Lord (6 Rex-sidette), D. S. Kapadia (8 Rex-Jap), and A. R. Abbott (3½ Bradbury). Cyclecars.—C. H. Corfield (6 C. and H.), D. A. Parsons (8 G.W.K.) Of the absentees, Mundy (4½ Quadrant sc.) was last heard of at a point near Grantham; Byott (6 Salway sc.) arrived one hour late at York, the cause of his delay being lamp trouble. Bonflier (Bradbury sc.) was missing.

Start for the open scratch race for engines up to 350 c.c. at the Mablethorpe speed trials. F. P. Johnson (2½ h.p. Humber) proved victor.

**SPEED TRIALS AT MABLETHORPE.**

A largely attended and successful series of speed trials were held by the Nottingham Motor Cycle Club on the sands at Mablethorpe on Saturday, and as the day was fine and warm most of the visitors at the popular seaside resort turned out to see the competitions. Special interest was shown in the ladies' race, in which one competitor (Miss Shipside) was only 16 years of age. Two of the lady competitors rode men's machines. Some difficulty was experienced with sidecars in soft parts of the sand.

An unfortunate accident, in which a little girl was injured, occurred during a practice run. The girl, who was playing behind some boats on the beach, was badly cut on the head and thigh. The results were as follows:

Club Handicap (distance, one mile).—1, F. B. Halford

(2½ Martin-Jap); 2, J. R. Sylvester (2½ New Hudson). Ladies' Race.—1, Mrs. Simpson (3½ Rudge); 2, Miss Shipside (2½ Premier).

Open Scratch (under 350 c.c.)—1, F. P. Johnson (2½ Humber); 2, J. Sylvester (2½ New Hudson). 100 yards between first and second.

Open Scratch (under 500 c.c.)—G. S. Hall (3½ Scale-Jap). Open Handicap (all comers).—1, G. S. Hall (3½ Scale-Jap); 2, J. D. Mitchell (3½ Rover). 150 yards between first and second.

Open Scratch (unlimited).—1, R. W. Fornington (7 Indian); 2, W. Grocock (6 Zenith). 75 yards between first and second.

Cyclecar and Sidecar.—G. Brough (7 Brough sidecar).

Start of the sidecar race, which was won by G. Brough (on left) on a 6 h.p. Brough sidecar. The cyclecar is a Baby X.

**COMPETITIONS IN IRELAND.**

An open sidecar trial was held by the Dublin and District Motor Cycle Club on the 31st ult. The start was from Terenure. The conditions were of the customary character, and there were two open controls at Woodenbridge and the finish, and five secret controls en route.

The course lay down the western side of the counties Dublin and Wicklow, across the border by Tinahely and Aughrim to Woodenbridge and home by Rathdrum and Newtownmountkenedy, a total distance of 107 miles. The afternoon was very fine but the roads rough.

Four of the riders, Roche (3½ Rover), Greene (3½ Rudge), Weir (7 Indian), and Armstrong (3½ Rudge), secured full marks at the open controls, while Allen (3½ Rover) and Letchford (3½ Humber) each lost one and Walker seven. These were the only riders to complete the full distance, and the Indian trophy, offered in the competition, should go to Roche, Armstrong, or Greene. Of the others, Jenkins (5 Clyno) was in trouble early, and Rollins (5 Clyno) retired on the first half of the journey, after having three punctures and four bursts in his back wheel.

### Western District M.C. (London).

The postponed reliability trial for the Williams Shield to Tetworth and back from Uxbridge is fixed for the 7th inst. A petrol consumption trial will be held on the 21st inst.

### South Birmingham M.C.C.

The postponed novices' hill-climb will be held on the 7th inst. The hill chosen will be quite straight, and safe for the knock-out principle. The classes are: Lightweight, Touring, T.T., and Passenger.

### Surrey M.C.C.

The Surrey v. Hants hill-climb, held on Wednesday last, resulted in a win for this club, the members securing first and second places in Classes I., II., III., and V., and scoring 1,717 points (average 143) against the 1,475 (average 123) scored by the Hants M.C. Union. Results:

#### CLASS I.

Name.	County.	Machine.	Time.	Fig. of m. s. merit.
1. F. A. McNab,	Surrey	(2½ Douglas)	...	1 44.2
2. F. W. Barnes,	Surrey	(2½ Zenith)	...	1 47.4
3. T. Thompson, jun.,	Hants	(2½ Douglas)	...	1 52.8
4. T. Thompson, sen.,	Hants	(2½ Douglas)	...	2 19.2

#### CLASS II.

1. F. W. Barnes,	Surrey	(3½ Zenith)	...	1 33.8
2. S. Holbrook Crow,	Surrey	(3½ Zenith)	...	1 40.4
3. H. W. Watkins,	Hants	(3½ Triumph)	...	1 34.8
4. G. A. Watkins,	Hants	(3½ Humber)	...	1 43.2

#### CLASS III.

1. F. W. Barnes,	Surrey	(2½ Zenith)	...	1 45.4
2. F. A. McNab,	Surrey	(2½ Douglas)	...	1 43.8
3. H. W. Watkins,	Hants	(3½ Triumph)	...	1 31.2
5. R. Barclay,	Hants	(3½ Rudge)	...	1 33.4

#### CLASS IV.

1. J. G. Kimber,	Hants	(6 Matchless)	...	1 26.8
2. G. W. L. Meredith,	Hants	(3½ Triumph)	...	1 27.6
4. F. W. Barnes,	Surrey	(6 Zenith)	...	1 33.2
5. T. G. Meeten,	Surrey	(3½ Rudge)	...	1 35.4

#### CLASS V.

1. F. W. Barnes,	Surrey	(6 Zenith)	...	1 57.6
2. R. C. Pearson,	Hants	(3½ Premier)	...	2 30.0
3. T. G. Meeten,	Surrey	(3½ Rudge)	...	2 31.2
4. — Humphries,	Hants	(3½ Premier)	...	2 41.8

### Scarborough and District M.C.

On the 25th ult. the annual autumn reliability trial was held over last year's course. Seven hills were officially observed, and competitors penalised for rendering assistance to machines. One hill, Limber Bank, is so severe that every competing motor cycle failed. Needless to say, the sidecar combinations failed as well; even a 20 h.p. car failed at two attempts. The worst portion, 1 in 3½, is preceded by an acute bend.

An interesting feature of the trial was the effort to find out which is the superior machine over—the motor cycle, motor cycle and sidecar, or the ordinary car—and for this purpose a £5 cup was offered for the best performance made by one of the three types. The same system of marking was used for all three, excepting that machines up to 560 c.c. with sidecars were scheduled to run at only 15 m.p.h. Strange to say, the little 10 h.p. two-seater Stoewer made the best performance by losing only 6 marks. The next best performance was made by a 6 h.p. Enfield and sidecar, with a loss of 35 marks. The best performance on a solo machine was poor compared with the two previous performances, as the rider lost 64 marks. There were twenty-two starters. Eight had to retire in the trial for various causes. Results:

Class I.—1, J. E. Truefitt, Scarborough (3½ F.E. Triumph), lost 64 marks; 2, W. Jackson, Scarborough

(3½ Premier, three-speed), lost 126 marks; 3, D. Gill, Doncaster (3½ Calthorpe), lost 184 marks.

Class II.—1, C. P. Finn, Pontefract (6 Enfield sc.), lost 35 marks. The other three passenger combinations retired.

The Klawitter £5 cup for the best performance of the day, for motor cycle, motor cycle and sidecar, or touring car, was won by the hon. secretary, J. W. F. Tranmer, on a 10 h.p. Stoewer car.

### Manchester Hundred M.C.

On the 31st ult. the club held their first annual motor gymkhana at Hoo Green. The weather kept fine, and a large number were present. The events were run off on the large field behind the hotel, and were thoroughly enjoyed by both competitors and spectators. Much amusement was caused in the tug of war by the breaking of the rope, presumably the result of a practical joke.

### Foleshill and North Warwickshire M.C.

The club hill-climb held at Newnham Hill on the 24th ult. resulted as follows:

For machines up to 500 c.c.: 1, C. Orr (3½ Ariel); 2, W. Brandish (3½ Triumph).

For machines of any description: 1, W. Brandish (3½ Triumph); 2, G. H. Broad (3½ Triumph).

Flexibility climb (same gear): 1, W. H. Broad (3½ Ariel); 2, G. H. Broad (3½ Triumph).

C. Orr made fastest time of the day in the latter event on an Ariel.

MERSEY M.C. OPEN RELIABILITY TRIAL LAST SATURDAY. Competitors climbing Matlock Bank, a gradient of 1 in 5. Many came to grief here.

A group of members of the newly formed Gooles and District M.C.C. This club has already a membership of 26.

### Wishaw and District M.C.C.

About fifteen members journeyed to village of Coulter for a hill-climb competition with the following result: 1, Jas. L. Muir ( $3\frac{1}{2}$  Rudge), 39s.; 2, L. McLean ( $3\frac{1}{2}$  Triumph), 43s. The prize on formula went to W. Marshall (3 Clarendon).

### Cheltenham M.C.C.

A club has been formed in Cheltenham with the above title; the headquarters are the Belle Vue Hotel. The club will shortly be affiliated with the Auto Cycle Union. Chairman, Mr. W. J. Bache; and hon. secretary, Mr. A. W. Goleworthby, 413, High Street, Cheltenham.

### Newcastle and District M.C.

The Gordon-Roberts Reliability Trial, which received an entry of twenty-seven motor cars and motor cycles, was successfully carried through on August 24th and 25th. In both the motor car and motor cycle sections the first and second prizes were presented by Messrs. J. S. Gordon and G. E. Roberts respectively.

The competitors travelled by way of Gateshead-upon-Tyne, Marley Hill, Annfield Plain, Lanchester, Wolsingham, Stanhope, St. John's Chapel, Killhope, Alston, Melmerby, Penrith, and Greystoke, to Keswick, a distance of eighty-seven miles; and, staying there over-night, returned by way of Windermere, Kirkstone Pass, Eamont Bridge, Shap, Kendal, Kirkby Lonsdale, Sedbergh, Kirkby Stephen, Brough, Bowes, Barnard Castle, Winston, Piercebridge, Darlington, and Neville's Cross, to Newcastle-upon-Tyne, a distance of 180 miles, bringing the total distance of the trial up to 267 miles.

The weather conditions throughout the trial were of the most wretched description, rain falling practically the whole of the time, and as a result the roads in some parts were almost unrideable; particularly was this the case upon Killhope. In other places the roads were so greasy that many of the competitors had great difficulty in retaining their seats.

Result of the motor cycle competition:

1. G. W. Raper ( $2\frac{1}{2}$  l.p. A.J.S.), who lost no marks; error, 9s.

2. Lawrence Austin (5 h.p. A. J.S. and sidecar), who lost no marks; error, 21s.

Club enamelled silver medals.—F. A. Rudd (6 h.p. Rex-Jap), L. W. Hall (Triumph), R. J. Spencer ( $3\frac{1}{2}$  h.p. Norton), and W. Baxter (5 h.p. A.J.S.), who lost under 30 marks.

Club bronze medals.—Jacob Garson ( $3\frac{1}{2}$  h.p. Ariel) and W. S. Dodds ( $3\frac{1}{2}$  h.p. Singer), who lost more than 30 marks, but who completed the course within 36 hours.

### Streatham and District M.C.C.

The Streatham open hill-climb is being held on Saturday next, the 7th inst. Weighing in at the Clayton Arms, Godstone, up till 1 p.m. The venue of the hill will be posted up at the scales.

### Belfast and North of Ireland M.C.C.

An excellent field turned out for the 100 miles reliability trial on Saturday last for the cup presented by Messrs. John A. Prestwich and Co. Result:

1. James Millar ( $6\frac{1}{2}$  h.p. Campion-Jap).
2. Thomas McCluney ( $3\frac{1}{2}$  h.p. Chater-Lea-Peugeot).
3. John Robb ( $3\frac{1}{2}$  h.p. Swallow-Jap).

### Westmorland M.C.C.

A reliability run was held on the 18th ult. for the Triumph Challenge Cup, medals, and the Graphic prize, presented by the Graphic Garage, Penrith. The course, which was a very severe one of 100 miles, and included Kirkstone Pass, Red Bank, Gummars' Howe, and Underbarrow Scar, had to be non-stop between checks. Result: 1, W. Hutchinson (6 Zenith); 2, H. B. Harrison ( $3\frac{1}{2}$  Rudge), 5s. error; 3, Geo. Braithwaite ( $3\frac{1}{2}$  Rudge), 30s. error.

Hill-climb held last week up Underbarrow Scar. Results: Lightweights.—1, H. Jackson ( $2\frac{3}{4}$  Douglas); 2, R. N. Chaplow ( $2\frac{3}{4}$  Humber).

Single-cylinder.—1, G. H. Braithwaite ( $3\frac{1}{2}$  Zenith); 2, L. Pierce ( $3\frac{1}{2}$  Corah).

Twin-cylinder.—1, J. H. Nelson (Scott); 2, L. S. Parker (Scott).

Fastest time.—R. Bownass ( $3\frac{1}{2}$  Matchless).

### Mid Bucks M.C.C.

The last of a series of four reliability trials was held on the 26th ult., when, in spite of very adverse climatic conditions, a most successful run took place. The route, which was one of forty-two miles, was by way of Aylesbury, Thame, back to Aylesbury, and thence to Leighton and home, the competitors being required to maintain a speed of seventeen miles per hour. The use of watches and speedometers was barred. The entrants were despatched from the club's headquarters, the King's Head Hotel, at 8 p.m., by Mr. J. H. Smith, who acted as timekeeper, and some very close times were witnessed. The results were as follow: T. Hopcraft 99 points, E. G. Eborn 99, C. G. Strugnell 93, S. T. Cook 92, F. L. Strugnell 91, and E. W. Russell 90. On the four trophy runs points were awarded as follow: Hopcraft (Rover) 344, Cook (Premier) 306, Eborn (Rudge) 285, Ball (Triumph) 281, C. G. Strugnell (F.N.) 253, F. L. Strugnell (Triumph) 166, Edgington 165, Mott 86, and Smith (Ariel) 84. T. Hopcraft will hold the trophy for twelve months.

Group of members of the Leicester County M.C.C. taken on the occasion of their inaugural run.

# QUESTIONS & REPLIES

SRJ

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Perfect Mixture.

I have been reading with great interest the letters in *The Motor Cycle* on carburetters. Could you please answer the following:

(1.) What is the perfect mixture? Is it that at which the engine goes fastest? (2.) What are the causes of burnt valve seatings? (3.) My machine has a peculiar symptom. When on long journeys, after ten or fifteen miles, I suddenly find the engine begin to knock and clank most painfully. This is at once stopped by almost or entirely closing the air lever when the bicycle at once gains way. The air lever can then be opened slowly. My normal jet is 32. I have tried 33 and 34 (B. and B. carburetter), but the results are no better.—C.R.

(1.) A perfect mixture is that on which the engine travels best at a given throttle opening. As to the degree of opening you can give to your air lever this depends very much upon the combination of jet and choke tube in the carburetter. The exact position of the lever is absolutely no guide. (2.) Driving on a strong mixture, or on an excessively weak mixture would cause it. Also the valve timing can have an effect on the burning of the valve seatings. (3.) The symptoms you indicate point to overheating, but are really quite normal for an air-cooled engine. It probably means that you have been driving too hard. The engine should recover after a long run down hill.

## Police Prosecutions.

Would you kindly inform me of the law relating to riding a motor cycle through a town? I am to be prosecuted for riding at the rate estimated by a policeman (not timed) of eight to ten miles an hour. Do you think that by joining the A.C.U. now they would take the case up for me?—N.H.

The police cannot prosecute you for exceeding the speed limit and driving to the danger of the public on the same summons. They will either summon you for driving to the danger of the public, when the rate need not be timed, or if you were driving through a speed limit area in excess of the speed prescribed by law, you could then be summoned for exceeding that limit. You do not say whether you were in a speed limit area or whether you are being prosecuted for driving to the danger of the public. In any case, it depends entirely on the circumstances of the case whether the A.C.U. would take the case up for you. What you had better do is to join and then acquaint the secretary with the circumstances. Application for membership should be addressed to the Secretary, A.C.U., 89, Pall Mall, S.W.

## Mysterious Misfiring.

I should be much obliged if you or any of your readers who have experienced a similar trouble could give me any opinion as to the cause of occasional misfiring.

About six months ago my engine began misfiring with loud explosions in the silencer. I sent the magneto to the makers, who rebushed it and remagnetised it, besides generally overhauling it. I fitted the magneto on, and for a month the machine ran excellently, then the same trouble began again. I sent the magneto back to the makers who returned it to me in no way improved. I therefore took it down myself and thoroughly cleaned it, but found nothing wrong with it; when I put it back, however, the machine ran excellently, and has done so for two or three months. Recently, however, misfiring began again and I repeated the treatment, slightly increasing also the space of the safety gap with the same excellent results. The misfiring does not seem to me to be entirely due to the oil in the magneto, as the firing was improved by advancing the spark until the engine knocked, and again the misfiring almost or entirely ceased when the engine had got quite hot and remained all right as long as it was kept very hot, though the spark was again retarded to a normal position. That the misfiring was not caused by the automatic inlet sticking seems clear from the fact that when the misfiring occurred, the charge went through to the silencer and was then exploded by the heat. I have run the machine in the dark and can see no sign of shorting. The sprocket also had not slipped round on the spindle, as both were marked and were in correct relative position. My only possible solution is that the safety gap in the magneto is slightly too short, and this I have enlarged to a very small extent. The makers, however, did not seem to think it too small. The magneto gives a strong spark when the armature is turned sharply with the fingers.—J.G.S.

We have carefully considered your letter, and must say that the case is a very puzzling one. The only way really to settle the matter is to ask the makers of the magneto if they would be willing to exchange the magneto for another one or lend you a magneto of the same type for trial, so that you could see whether there was any improvement. It is possible for misfiring to occur through sticking of the exhaust valve, and if yours is at all a tight fit, we should advise you to take it out and reduce same slightly with emery cloth.

ANOTHER NEW SOCIABLE.

Geo. E. Lambert, the designer of the Lambert cyclecar, at the wheel of the latest model of that make.

Side view of the Lambert cyclecar, showing chain transmission. This neat three-wheeler is fitted with an 8 h.p. J.A.P. engine, and three-speed gear.

Whitworth Works, **BIRMINGHAM.**

# Licences.

?

Having been a reader of your paper for over seven years, I should like you to settle a dispute I have with a friend, by giving me information as to the following questions. Is it legal for a man to sell a solo mount to his wife (she not to ride same after having bought it) and buy a sidecar combination, using his old revenue licence for the new machine? Would it be legal for the wife to keep machine bought from husband without taking out revenue licence.—E.I.R.

If the transaction be a *bona-fide* one, it is quite legal for a husband to sell a motor cycle to his wife and she would not have to pay a local taxation licence for it provided she did not ride it at any time during the year. The husband, when parting with the machine, would be compelled either to transfer the old registration to his wife, the new owner, or she could apply for the registration to be transferred to her on payment of the fee of 1s., or the registration could be cancelled. When buying the new machine, the husband would, of course, have to take out a fresh registration, but could use his old local taxation licence, as the latter entitled the holder to keep one motor cycle for a year, dating from January 1st.

## Oil Plug in Rear Cylinder.

?

I ride a 6 h.p. twin 1910 a.o.i.v. The back plug is always getting clogged up with oil, and not firing. I have tried reducing the oil supply, but it is still no better. The oil burns across the points and shorts. If I take the plug out and thoroughly clean it it is all right again for five or six miles, and then the trouble starts again.—W.E.I.

If the plugs are fitted in the centre of the cylinder right over the pistons and not at the side, the trouble complained of is due to over-lubrication. If the plugs are fitted at the side the oil is flowing off the edge of the piston right on to the plug, and the best remedy is to change the position of the plugs to the centre of combustion head or cylinder. A single point plug will keep as clean as most others, but you might overcome your difficulty if you were to try a pair of the special plugs made for the Ford car. These are obtainable from the Lincolnshire Autocar Co., Carlton House, Regent Street, W. The Bosch Magneto Co., 40, Newman Street, Oxford Street, W., also make a special plug for oily engines. This plug has points with knife edges, and the heat of the spark, it is claimed, will burn off the oil.

## Newcastle to Bournemouth and Back.

?

My chum and I intend riding from Newcastle to Bournemouth next month. We wish to go by Harrogate and Birmingham, as we have friends to see at these places. Can you tell us the best route to take and the distance? We propose coming back by London, Grantham, and Doncaster.—J.B.

Your best route would be as follows: Harrogate, Wetherby, Aberford, Ferry bridge Doncaster, Tickhill, Workson, Mansfield, Derby, Lichfield, Sutton Colfield, Birmingham, then through Henley in Arden, Stratford-on-Avon, Shipston

on-Stour, Woodstock, Oxford, Abingdon, East Ilsley, Newbury, Whitechurch, Winchester, Romsey, Cadnam, Lyndhurst, Christchurch, and Bournemouth. To return *via* London, take the following route: Bournemouth, Lyndhurst, Cadnam, Winchester, Alton, Farnham, *via* the Hog's Back to Guildford, and on through Ripley, Esher, and Kingston. Your exit from London should be *via* Marlborough Road, Swiss Cottage, Finchley, and Barnet, and then straight up the Great North Road.

A MOTOR CYCLING MARRIED COUPLE AT THE FORTH BRIDGE.

R. M. Chaplow (2½ h.p. Humber) and Mrs. Chaplow (2 h.p. lady's Humber), who recently completed a 500 miles tour in Scotland. We are told that both machines ran splendidly throughout. Mr. and Mrs. Chaplow are members of the Westmorland M.C.C.

## Improving an Old Machine.

?

I have just bought a second-hand 5 h.p. twin Antoine coil and accumulator, and I want to fit a magneto. Could you tell me—

(1.) What angle the cylinders are? (2.) Would it make any difference in power? (3.) When the speed gear is in the free position, that is half-way along the quadrant, the engine runs free for a few revolutions and then suddenly pulls the machine forward for a few yards as if locked and then releases again—could you give me a remedy for this and tell me the cause? (4.) It is fitted with an old type of B. and B. carburetter—would a newer one be an improvement? (5.) Should both plugs be alike?—D.B.

(1.) To the best of our recollection, the engine in question has the cylinders set at an angle of 60°. The makers of the magneto will, when you order it, tell you this when you give them the name and date of the engine. (2.) It would make a slight difference in power. (3.) We should say that the gear is worn, and that the lever does not remain fixed in the quadrant, and allows the low gear to engage slightly. We cannot explain this in detail, as you do not mention the type of gear fitted.

Adjusting the gear correctly will probably cure the trouble. (4.) Yes, a modern carburetter would be an improvement. (5.) It is desirable, but not necessary.

## Sidecar Machine for a Novice.

?

(1.) I shall be grateful if you will give me a few hints as to the best kind of motor cycle to purchase for solo and also sidecar work at a reasonable figure.

I am quite a novice as regards motors, and am very perplexed as to a suitable make. (2.) Which is best sidecar, a castor wheel or a fixed wheel? (3.) Some cycles, I am told, have the change gears controlled by the feet, others by the hand. Which is safest? (4.) Is it necessary to have three-speed gear or two-speed for sidecar work?—G.E.W.

(1.) It is always very difficult to give advice regarding the purchase of a sidecar machine. The 3½ h.p. with change-speed gear behaves very well in fairly level country, but when stiff hills have to be encountered the more powerful twin-cylinder is the type which is required, but it is hardly such a good machine for a novice to learn on as a 3½ h.p. (2.) The fixed wheel sidecar is the most popular. (3.) Most two-speed gears are controlled by the foot, and are very conveniently operated, while the three-speed gears are hand-controlled. There is no difference as regards safety. (4.) Most certainly.

## Lights on Sidecars.

?

It may be of interest to fellow readers to know that, if riding through Llandaff, near Cardiff, they may be fined 15s. 7d., as I have been, for not having two lamps in front on sidecar combination. Whether it is legal or not, I was summoned and had to pay as above, although I pointed out that I had one good light at the time. I should be glad of your opinion.—W.B.

Our legal representative replies: "There is no doubt that byelaws may be made making stricter provisions with regard to lights on sidecars than those which are in force according to the ordinary law of the land. I do not know when the byelaw referred to was passed, but I would point out that the Lights on Vehicles Act, 1907, provided that all byelaws then in force relating to lights on vehicles should from the date of the passing of that Act cease to have effect so far as respects vehicles to which the Act applies. As the Act does not apply to a motor cycle, any byelaw passed before that time would still be applicable, and if it has been passed since that time, no question arises."

## EXPERIENCES WANTED.

"S.K.R." (Wells).—Best way of running 3½ h.p. Scott by one who has only been used to a four-stroke.

"C.F." (Doncaster).—Triumph fitted with Bowden two-speed gear.

"W.H." (Southport).—2½ h.p. E model Douglas, with sidecar.

"T.B." (Mysore).—(1.) Four-cylinder two-speed F.N. with sidecar. (2.) T.M.C. with sidecar. (3.) G.W.K. cyclecar.

"D.M.I." (Derry).—4½ h.p. Excelsior fitted with Binks carburetter.

"A.J.K." (Dovercourt).— "Levis" two-stroke. Reliability and consumption.

**A Forced Feed Carburetter.**

On the suction stroke of the engine the down stroke of the piston is utilised to force air from the crank case along

the pipe A to the carburetter. The petrol passage B is of large bore, and through it passes a tube C along which the air from the carburetter passes, providing a full charge and inducing an adequate supply of fuel from the jet outlet.—H. C. Newman, No. 14,642, 1911.

**A Belt Fastener.**

The portions A embrace the ends of the belt B, as usual, and are formed with circular eyes, into which are secured

studs C, by acetylene welding or otherwise. The parts A are held together by plates D which are slotted to pass over projections E on the ends of the studs

**A Success in France.**

Continental tyres were used by O. C. Godfrey when he won the French Motor Cycle Grand Prix.

**A New Address.**

The "AK" Manufacturing Company have moved into larger premises at 348a, Idle Road, Bradford. They are the makers of the well-known "AK" knee grip, tyre gaiters, and pouch belts, etc.

**Lubricant in the Six Days' Trials.**

In the A.C.U. Six Days' Trial Sternal was particularly successful in gaining twenty-one honours out of thirty-five competitors who used it. It was also noticed that the failure of the other fourteen competitors was on no account due to lubrication or engine trouble.

**A Tyre Gaiter.**

Messrs. A. Nuttall and Co., leather factors, Goodmayes, Essex, have lately brought out a chrome leather sleeve for laying round the inner tube and protecting it against bursts in the outer cover. The sleeve, which is unaffected by heat, is a useful accessory, and has called forth several valuable testimonials from riders who have found it of the greatest service in actual practice.

**Records.**

We are in receipt of a booklet published by the Hendee Mfg. Co., entirely devoted to records and performances obtained by Indian motor bicycles, both in the United States and Great Britain. The book makes most interesting reading, as it forms a complete history of this most successful make of motor bicycle. The remaining three pages are devoted to a useful speed table.

**PATENTS.**

C when the parts are in a position which they do not assume when in use. The parts, therefore, cannot become detached accidentally.—R. W. Young and H. J. Walford, No. 14,004, 1911.

**A Gradually Variable Gear.**

Mounted upon the engine crankshaft A is an eccentric carrier B. Around the carrier B rotates, upon ball bearings, a variable pulley device C of the movable flange type. This pulley mechanism is driven from the engine-shaft by a spur gear D meshing with an internal ring E, the gears forming a reducing gear and enabling a large pulley to be employed. In operation, the eccentric carrier B is rotated upon the crankshaft by a Bowden wire F, or other device, setting up a variable tension on the belt, which is compensated by automatic movement of the movable pulley flange, thus providing a gradual variation of the gear ratio.—No. 23,084, 1911.

**A Cyclecar Differential Drive.**

The driving wheels, A, B are mounted upon short axles C and are driven by chains D from a counter-shaft E. The drive from the engine F to the counter-

shaft is by means of a V belt G engaging a pulley H, each flange of which is mounted upon its own sleeve J driving

one of the chains D. One flange of the pulley H is slidable against a spring K by means of a wedge device L, so that when this is operated belt slip is permitted and the rear wheels allowed to rotate at different speeds, thus providing the effect of a differential gear.—C. N. Legge, No. 6,570, 1912.

**SPARKLETS****Silencers a Speciality.**

We are in receipt of the latest catalogue of Messrs. J. C. Lyell and Co., Ltd., 113, Great Portland Street, W. The accessory sold by this firm which is best known is the Clair silencer, which has several times been referred to in these pages. These silencers are made in all sizes from 14 h.p. to 7.9 h.p., and are suitable for twin-cylinder machines.

Shield to catch petrol spray fitted to the latest Triumph machines. It is said greatly to economise petrol.

**A RECOMMENDATION TO SIDECAR USERS**

Recent accidents, at least one of which has proved fatal, due to breakage of the front sidecar connection, draw attention to the need for an additional supporting tube. We recommend every sidecar to have a supplementary tube fitted, as shown.

**Catalogues Received.**

The latest catalogue of the Forward Cycle and Motor Co., 6-7, Edmund Street, Birmingham, contains, in addition to illustrations and particulars of the 2½ h.p. twin-cylinder machines, several interesting photographs of the 1911 Six Days' Trials.

The Leatheries, Ltd., Birmingham, send us their catalogue of saddles, tool cases, carriers, etc. The Empire de Luxe motor cycle saddle has been specially designed to give the rider an extremely low position.

The pocket edition of Brown Bros.' catalogue is one of the handiest books of reference for the motorist that we know of. It contains illustrations, prices, and descriptions of practically every article in the accessories and fittings, trade with a useful index. Readers may procure a copy on application.

# RONI

## The Famous Bray "Roni"

Acetylene Burner

FOR

Motor Cycle Headlights

Gives, from a single gas-way only, an atmospheric flat flame which cannot become distorted and crack mirror or lens.

The burner is of the air-injecting type—it will not carbonise.

It is now fitted with a pressure check which obviates flaring.

Send for descriptive booklet of the "Roni" Burner to

## "BURNETT" PATENT SUCTION - CUP TYRE.

Six Days' Sidecar Record beaten by Mr. Norman Taylor on "Burnett Tyres," riding 1,553 miles.—See "Motor Cycling," p. 367.

### TESTIMONIAL.

30, Upper Sandhurst Road,  
Brislington,  
BRISTOL.

March 27th, 1912.

Messrs. The Burnett Motor Tyre Co.,  
Melksham, Wilts.

Dear Sirs,—It is with much pleasure that I express to you my satisfaction of excellent results I have had from one of your Special 3-ply Motor Cycle Tyres, which I purchased from you in 1910.

I fitted tyre to the rear wheel of my 4½ h.p. single-cylinder motor cycle, sidecar attached, and ran about 3,000 miles without having the least bit of trouble, not even a puncture. I have since removed tyre to wheel of sidecar, and after 1,000 miles is still in excellent condition.

It is also interesting to note that during the time tyre was running on rear wheel of motor cycle, I used no less than three tyres of well-known makes on front wheel, which caused me no little inconvenience.

I may also add that I found tyre excellent as a non-skid during bad weather and far superior to any other make of tyre which I have ever tried.

Yours truly, W. H. WHITE.

## STERNOLINE MOTOR GREASES

In the new flat tin  
with the handy scoop.

"STERNOLINE" Motor Greases  
should be used by all Motorists who  
consider economy.  
They abolish all friction, thus reducing  
wear and tear on the car. See that  
the seal is intact.

Full particulars and prices on request.

**STERNOL,**  
56, Royal London House,  
Finsbury Sq., London, E.C.

## See that Security Sleeve?

It overcomes the one disadvantage  
of the Butt-ended Tube—bursting at  
the ends. It is the feature of the  
"Challiner" Patent Butt-ended Tube.  
With it you have the security of the endless tube  
and the handiness of the butt-ended one.

The Security Sleeve is fixed to the rim by the winged nut  
and bolt; the butt ends of the tube fit in it like a glove.

The centre of the Security Sleeve is a bulkhead of insulated  
canvas which makes bursting of the ends an impossibility.

**'Challiner' Patent Butt-ended Tubes  
are burst-proof at the ends.**

If a tyre fitted with this tube were inflated to bursting point, the  
burst could not occur at the ends.

The bulkhead keeps the Tube ends firmly in position; and being  
fixed to the rim directly opposite the valve, it prevents all 'creeping'.  
'Creeping' of the Butt-end Joint is what causes other tubes  
to burst.

Fit "Challiner's" to your mount now!

## ROBERTSONS

up to the present have not broken out into lengthy words of self-praise in their advertisements. They have found it quite unnecessary to do so: besides, a couple of columns in "THE MOTOR CYCLE" costs a lot of money (Advertising Manager please note). Their only excuse for doing so now is because their Manager has just had a day's holiday, and he has caught the holiday feeling. He spent part of his holiday in reading the advertisement columns of this journal, and he thought what splendid material was to be found in those columns for an article on **FIRMS**. He was interested to notice that there were "Square" **FIRMS**, "Round" **FIRMS**, "Nice" **FIRMS**, "Straight" **FIRMS** (he knows some crooked ones), "Exclusive" **FIRMS**, "Liberal" **FIRMS**, "Reliable" **FIRMS**, "Superior" **FIRMS**, "The" **FIRMS**, **FIRMS** who "can" supply everything, and a lot that cannot, **FIRMS** who give something for nothing, and quite a number who give nothing for something, **FIRMS** that "satisfy" (sounds like a well-known "breakfast food advertisement"). He noticed that some **FIRMS** had fires (Robertsons have only gas stoves), and others Stock Taking Sales at which splendid motor cycles are offered at ridiculously low prices (that's **ROBERTSONS**), and after his bewildered brain had become normal, he momentarily wondered if it would not pay **ROBERTSONS** to adopt a self-added laudatory adjective prefixed to their name, but these all seem to be booked, so they still intend to be known simply as

## ROBERTSONS

While in this mood, the Manager would like to point out to those artless enquirers who want us to take in part exchange for motor cycles, parrots, pianos, white mice, gramophones, mangles, etc., that they only deal in motor cycles, as they do not like to have to refuse these offers, some of which are really quite generous. Besides, these kind enquiries cost them quite a lot in postage, and, anyway, **ROBERTSONS** like their typists to leave off work at 6-30 p.m. This is rather a rotten advertisement, and it is doubtful if **ROBERTSONS** will repeat it, but any enquiries that do come of it will receive prompt attention, as **ROBERTSONS** have no office canary, or other insect to distract their attention from their legitimate business, and **ROBERTSONS** promise not to break out like this again for a long time, if ever. **NOW** forget all the foregoing, but remember this: **ROBERTSONS** require a workshop of 25,000 superficial feet, and the services of 14 mechanics **SOLELY** for the purpose of overhauling their second-hand machines before they are sold. But in spite of this, **ROBERTSONS** do not charge more than any of the adjectival firms for your motor cycle. You cannot possibly do better than buy from

## ROBERTSONS

157b, GT. PORTLAND STREET, W.

ESTABLISHED 20 YEARS "IN THE HEART OF THE TRADE"

Our stock is large and varied, we can suit every possible purchaser. No matter what you are looking to find, we have it and can dispatch it promptly, you can rely upon honest and fair treatment. We have a number of

## SECOND-HANDS VERY CHEAP

If you prefer to start with a moderate priced machine, try a little lightweight, a Douglas, or an Enfield, or a Motosacoche. We have some of these ranging from £14 or £15 up to £35 (the last being for a first-class machine of recent date, with two-speed gear etc.) If you want to start with one of the best, then we call your attention to some

## SOILED 1912's CHEAPER.

These machines come out cheaper than second-hands when one takes quality into consideration. We have machines that have come to us from various sources, exchanges for other makes, etc. One or two have been used a little, one or two may have been used perhaps a week or two. We have a free-engine Rudge, a three-speed Premier, a 3½ h.p. Zenith, a 6 h.p. N.S.U. (very powerful sidecar machine), a 6 h.p. Zenith, etc., etc.

## CASH OFFERS INVITED.

If you are open to purchase a new machine at a bargain price, write us.

## INSTALMENTS ACCEPTED.

Perhaps there are other circumstances to be considered, that you would like to buy a good machine, either second-hand or new, but would prefer not to pay out the whole of the cash at once, if so, will you give us particulars of how much it would suit you to pay at time of delivery and how much at later dates.

## EXCHANGES ARRANGED.

In addition, we are always open to do a deal of one machine for another, you may wish to change a lightweight, for a heavy-weight or vice-versa, or to change a 1910 machine for a 1912, and so on. If so, simply give us particulars of your old machine and either an exact or general idea of what you want to change to and we will give you a quotation.

NEW Hudson, 1912, 2½ h.p., 3-speed, new April, new lamp, spares; £40, or near offer.—Cook, James Lane, Leyton.

3½ h.p. Minerva, 1908, £15; 3½ h.p. Triumph, £22; both in excellent condition.—Clifford Braiswick, Colchester.

2½ h.p. Royal Enfield, chain drive, 2-speed gear in June; cost 50 gu., accept £39.—Pearson Elm Grove, Southsea.

F.N., 1912, 5-6 h.p., 4-cyl. model, splendid condition trial by appointment.—T.R.P., "Montrose", lon Lane, Finchley, N.

DOUGLAS D., 1911, standard, splendid condition accessories, only wants seeing; £27.—Pries Newlands Rd., Norbury.

F.N., 2½ h.p., 2 speeds, shaft drive, perfect condition all tools and spares; any trial; £26.—151, 1 Mill, Upper Norwood.

1912 Phelon-Moore, delivered Whitsun, ridden miles, practically new condition; £50.—Mat pawnbroker, W. Craydon.

2½ h.p. Minerva, low, new Dunlop tyres, belt 24 saddle, fast, in new condition; £8.—76, H gate Rd., South Hackney.

KERRY Motor Cycle, with forecarriage attached 2 speeds and free; £12; any trial.—Young Kelsey, Jeweller, Potters Bar.

### Road Surfaces.

THERE is no doubt that if motor 'bus and char-à-banc traffic continues to increase at same rate as at present something will have to be done to our road surfaces to render them more even, or motor cycling must inevitably suffer. Drivers of light cars are beginning to complain also of the execrable road surfaces that exist wherever these motor juggernauts ply for hire. Our experience of road touring per motor cycle is fairly extensive, as may be imagined, and for two or three years past we have found that wherever a motor 'bus service is running or chars-à-bancs ply for hire roads are in a parlous state. It is absurd to argue that light motor cars and cycles are responsible for this sad state of the roads where 'buses run, for touring cars go everywhere and all roads are not so bad. Take, for instance, the main roads round Bath, where G.W.R. and other 'buses run several times daily over the same route, also the North-west coast, Welsh towns, and the coast roads from, say, Colwyn to Carnarvon; the surface, which was like a billiard table in old pedal cycle days, is now a collection of pot-holes with roughly mended sections; huge boulders being laid to combat, so we are told, the heavy toll laid on surfaces never intended to carry such weights. We refer to vehicles weighing several tons carrying thirty to forty passengers; these cars are also a menace to other forms of traffic. Almost without exception they are driven round sharp corners on narrow roads at too great speed in an endeavour to keep on top gear. Motor cycling in popular parts of North Wales and many such beautiful districts is rendered more dangerous by the overall width of these cars, which have a strong liking for

the crown of the road. At present they pay a tax of fifteen shillings per annum. Why no more?

### Rotary Engines.

AS far back as March 7th, 1910, we drew our readers' attention to rotary engines as motive power for motor cycles. This was penned at the time of the introduction of the Gnome engine for aeroplanes. Criticism of our view was naturally forthcoming and was welcomed. We are now pleased to lay before our readers technical particulars of a rotary engine, which is not only extremely light for the power developed, but provides at the same time a gyroscopic action, thus reducing the possibility of side-slip. Without trial of a machine fitted with this engine, it is impossible to say what it feels like to steer it, but we are inclined to think that it should be practically impossible to upset it. It may even be difficult to divert it from a straight line. However, the proof of the pudding is in the eating thereof, and we hope to try one very soon. The gyroscopic effect on the machine under review is obtained by the revolutions of the outside flywheel in one direction and of the cylinders in another, the engine being placed transversely in the frame.

The possibilities in the direction of rotary motor cycle engines are enormous, and the difficulties in manufacture and running are not insuperable. Lubrication appears to give the greatest trouble, but if oil be fed to the cylinders with the fuel, it should not prevent the engine from giving good results. We may be on the verge of an immense development in motor cycle efficiency if the known advantages of the rotary engine are found to carry no unforeseen drawbacks.

## On an Enfield Sidecar in the Six Days' Trial.

**W**E gladly accepted the invitation to occupy the passenger's seat of H. Colver's Enfield sidecar in the A.C.U. Six Days' Trials, as we desired to have some personal experience of this machine. On Wednesday, the third day, we repaired to the Drill Hall in good time and there found Colver awaiting his turn to enter the garage. The fifteen minutes in his case were hardly required. All he had to do was to inflate the Dunlop tyres a little harder owing to the extra weight the sidecar had to carry in the form of a male passenger of about 13 stones, oil the driving chains, etc.; the 6 h.p. J.A.P. engine and the remainder of the combination were all in good fettle.

### Oilskins a Necessity.

Rain was a certainty, so "oilies" were donned at the start, and at 8.59 we got the signal to go. The first 43½ miles, to Wellsway Inn at the top of Cheddar Gorge, was a 20 m.p.h. non-stop section, and included the ascent of Cothelstone Hill, a severe gradient described in our report of the Trials. The particular Enfield sidecar we were on had been returned to the makers as a "bad 'un" out of a batch of six that had been supplied recently. Judging, however, by the way it performed on this hill it must have been reborn in the interval, or Colver's consummate skill as a driver added a modicum of power, for it took the hill in grand style. There was suspicion of clutch slipping on the high gear at intervals during the day, which was perhaps more an aid than a detriment to its hill-climbing powers. At Wellsway Inn we clocked in about eight minutes in front of time.

Bristol was splendidly marked by boy scouts and arrows, and soon we were ascending the long winding hill on to Clifton Down. Close to the summit the engine stopped suddenly. What is it? Only a partial air lock in the petrol tank caused by the driver's coat covering the hole in the filler cap. On over the Downs, more boy scouts, more police, interested spectators, narrow roads, abrupt turnings, and on to the Gloucester Road at Filton.

Heavy banks of clouds denoted rain, and rain it did. Out come the Hutchinson boots. Somewhat regretfully we regard Mr. Alec Ross, dry and snug in the official Humber, as he is whirled past us to the Gloucester control. At Falfield we turn off the main road for Wotton-under-Edge, and after climbing up and running down the Cotswolds, with a splendid view of the Severn Valley and Bristol Channel below, we arrive at the Bell, Gloucester, well in front of time.

### A Diversity of Road Surfaces.

Over this section, comprising greasy oolite surfaces, steep and muddy roads alternating with occasional dry stretches, the Enfield pulled without a falter. After lunch the route lay *via* Birdlip to Cirencester. Colver

told us he had never been up Birdlip before, so we coached him regarding the Knapfand other parts of the ascent. Time was when Birdlip was a hill to motor cyclists, now it is despised as a test; nevertheless a fair number stopped on it that day. Our combination made an excellent ascent, the low gear being, of course, requisitioned on the steeper parts. Colver occasionally gave a dab at the oil pump, but the bulk of the lubrication was effected by the automatic sight-feed oiler, an Enots, which is on the top of the oil tank and is operated by crank case suction. The road through Malmesbury and Chippenham to Bath is undulating, and nothing occurred of note, nor are there any hills until after Bath is passed, when there is an ascent on to the Mendips at Chewton.

### Tea at the Greenore Check.

Cold rain fell here in torrents, but it did not affect the Enfield or its passengers beyond rendering the latter half frozen; a cup of tea at the Greenore check, however, soon put us in a better frame of mind, and with every confidence in our mount the remaining thirty odd miles were completed *via* Wells and Glastonbury with two stops, one to take up petrol at Wells, the other to give a fallen competitor a lift from the sixteenth milestone to the finish. We had started at 8.59 a.m., and were due at Taunton at 8.26 p.m.; it was, therefore, doubtful if we could get in without lighting up. Our driver decided to go through, as owing to our increased load, a fairly hefty male competitor in our lap, the average 20 m.p.h. in the dusk was rendered more difficult.

Overtaking competitors who were a little too much in front of time we romped along in fine style, and Colver was rewarded for his sporting action in assisting a fellow competitor by an arrival at Taunton nicely within the prescribed limit. It is a pleasure to ride with a man like Colver who takes no undue risks, gives one the impression that all is right, yet never loses a minute through excess of caution. Examination of the machine at Taunton showed a remarkably clean engine, and considering the state of the road surface and the weather encountered the rest of the combination had kept remarkably free from mud.

### A Summary of the Journey.

This day's journey of 106½ miles was the longest of the six, and although not embracing the steepest hills encountered during the trial, was sufficiently arduous to prove to the average tourist that the Enfield is a go, anywhere sidecar. Four Enfields entered for the trials, two gained gold medals (Colver's and Jameson's) and one a silver medal. Jameson also was originally awarded two silver cups, but was subsequently deprived of any award owing to a technical breach of the rules.

# MILITARY MOTOR CYCLING NOTES.

By "CELERITER."

## The Warwickshire Battalion.

THE War Office have asked Warwickshire to raise a cyclist battalion, which the County Association has consented to do, and Col. Arthur DuCros, M.P., will be nominated to the command, and he has conceived the idea of mounting this battalion of cyclists upon motor bicycles instead of upon the ordinary push cycle.

The suggestion has been debated in the daily Press, and certain competent military critics have given their opinions in writing, and it is more than probable that the original idea will become somewhat modified. At the request of Col. Ludlow, V.D., who is to be honorary colonel of the regiment, I myself made a few suggestions which I should like to see adopted, because I feel sure that they would help to further the cause of military motor cycling.

## Other Suggestions.

These suggestions provided for the formation of a pedal cycle battalion, two of the eight companies of which would be mounted on motor cycles and armed with Rexer automatic rifles capable of firing 220 rounds a minute per rifle. These motor companies in the scheme of coast defence would be placed in reserve, but with their great mobility they would be able to concentrate quicker at any given point, and with their great fire power they would form a most valuable force to hurl at an invader at the moment he was attempting a landing in ships' boats. I also suggested in order to get these companies as compact as possible that the men should be mounted in pairs, the man with the rifle sitting on a pillion seat fitted on the rear carrier.

Should my suggestions be adopted the following would be the establishment of motor cycles in the Warwickshire Cyclist Battalion: Headquarters 1 motor cycle officer, 1 motor cycle; with each cyclist company 2 motor cyclist orderlies, armed with Mauser pistols, 12 motor cycles; 1 captain, 1 subaltern, 8 N.C.O.'s in each of the two motor cycle companies on single machines, armed with Mauser pistols, 20 motor cycles; 50 men in each of these two companies, i.e., 25 drivers armed with Mauser pistols, and 25 pillion men armed with Rexer rifles, 50 motor cycles. Total, 83 motor cycles.

## Great Fire Power.

The fire power of each of the motor cycle companies would be produced by 25 Rexer rifles if we neglect the 35 officers, N.C.O.'s, and men armed only with Mauser pistols, and would produce a volume of fire of 5,500 rounds a minute, equal that is to say to the fire of 500 infantrymen armed with the ordinary service rifle. Of course, this rate of fire could not be maintained for a long period.

Captain Trapmann, who in his capacity as hon. secretary of the Legion of Cyclists may be considered an authority on the military value of motor cyclists, has, I understand, conferred with Col. Ludlow on the subject of the proposed battalion, and is shortly to meet Col. DuCros also, and possibly this meeting will result in a definite establishment being suggested to the War Office for their sanction. In the meanwhile I would advise all motor cyclists who wish to join this battalion to send in their names either to Col. Ludlow, Warwickshire Cyclist Battalion Headquarters, Birmingham, or to the Editor of *The Motor Cycle*.

A motor cyclist despatch rider in the Army Manœuvres. The messenger has just brought a despatch to the advance guard of cavalry and is awaiting orders.

## A Double Motion Rotary Engine.

**A** IS the flywheel which is attached to the crankshaft, and rotates in an opposite direction to the crank case and cylinders. It is a casting arranged with blades to take the place of spokes which give a cooling effect to the cylinders.

**B** shows the cylinders in section. These cylinders are turned out of solid steel and composed of outer casing, sleeve valve, and inner casing or cylinder proper, which are all secured to the cylinder head cap as shown. The particular features of the cylinders and valves are that they are extremely light, offering very little resistance, and owing to the special arrangement of the valve gear, the valves do not move under load, and their movement is very quick, giving immediate full port areas to the exhaust and induction gases. In the design of the pistons lightness has had every consideration.

The three connecting rods are fastened to the crank pin by two phosphor bronze retaining rings **C**, which are held in position by two steel spring clips which are sprung over the crank pin and retaining rings and drawn together by a set pin with an efficient locking arrangement for the two set pins as shown.

The crankshaft is of the ordinary balanced type.

**D** is a spur wheel with a long bush attached as shown, which runs into the gear box and has attached to it a lever which gives it a movement of approximately two inches. This is used for altering the setting of the valves for starting up, and is claimed to be an improvement on the new decompression devices, which are at present being fitted to some machines. The

spur wheel meshes direct with the wheels **E**, of which there are three, one for each set of valve gear. This wheel is keyed on to the camshaft as shown, which runs in the two brackets which are bolted to the crank case and carry the valve operating gear. There are four cams on the camshaft, one for operating the induction sleeve in an upward movement, and one for giving it a downward movement, of one cylinder, and the other pair do exactly the same for the exhaust valve of the other cylinder, doing away altogether with springs and giving a positive movement to the valves. It will be seen with this arrangement that three sets of valve gears placed in the space inside the crank case between the three cylinders does all the valve operating that is necessary, and forms a very compact arrangement which is always running in oil. It should be pointed out that the cams operate inside a rocking lever which is coupled to the lugs on the valves by a short connecting rod and gives the desired movement.

The crank case is built of three parts made from castings, one being a cylindrical drum with three flats which accommodate the cylinders and two covers with bearing bushes one for either side. One cover having an extended portion which runs into the gear case, and carries a gear wheel which is geared into a pinion attached to the transmission-shafts. The crankshaft also runs through into the gear case, and carries a similar toothed wheel which is meshed in a similar manner with the other transmission-shaft. The crankshaft rotates in an anti-clockwise direction, and the crank

- A. Flywheel.
- B. Cylinder.
- C. Retaining ring which holds connecting rods to crank pin.
- D. Spur wheel.
- E. Timing gear wheel.
- F. Gear case, one half of which is brazed to the frame.

- G. Rotary silencer.
- H. Three-way induction pipe.
- I. Stationary induction pipe.
- J. Porcelain or ebonite distributor.
- K. Bevel pinions.
- L. Crown wheels.
- M. Sleeve carrying clutch plates.

- N. Rear gear case castings.
  - O. Collar operated by Bowden wire.
  - P. Spring.
  - Q. Wedge pins.
  - R. Rear hub or drum.
- The sleeve and the parts revolving in a direction opposite to the engine are shown black.

### A Double Motion Rotary Engine.—

case in the opposite direction, giving a movement to the transmission-shafts in opposite direction and to the back wheel in the same direction. The gear case is supported to the frame of the machine by two stays going down from the crossbar. It is a crucible steel casting, made in two parts with the cover as shown. The one-half of the gear case F is brazed up solid to the two main bottom stays of the machine.

The transmission-shaft and crankshaft run on Skefko ball bearings, which are accommodated in the gear box, and the crank case runs on the long bush on the crankshaft.

The other end of the engine runs also on a Skefko ball bearing, not shown, which is accommodated in a lug which is brazed to the frame.

G is a rotary silencer which is attached to the strap which encircles the cylinders and receives the induction and exhaust gases, and H is a three-way pipe also attached to the cylinder strap, through which the induction gases pass to their respective cylinders. At the foot of this induction pipe a phosphor bronze face plate with apertures is accommodated forming a movable joint which works against the face of the stationary induction pipe coming from the carburetter.

On the stationary induction pipe I are fitted two brushes for transmitting the high-tension current from a Bosch magneto to the porcelain or ebonite ring J, which is fitted to the three-way induction pipe, and receives three wires from contact pieces leading to their respective sparking plugs.

Lubrication is provided for by means of a hollow crankshaft, through which oil is forced by a plunger pump through the crank pin, which lubricates the big

end and from thence falls into the crank case, where it lubricates the valve gear and other mechanism. It also passes through the two crank webs and lubricates the main bearings. The gear case is lubricated in the ordinary method by grease being forced in by a Stauffer lubricator.

The drive from the gear case is taken up by two bevel pinions K, keyed on to the two transmission rods; these are meshed into two crown wheels L attached to sleeve M, on which are fastened a set of plates, which are accommodated in the main hub and run between other plates fastened to the main hub in accordance with the ideas of the ordinary plate clutch methods. All these gears are enclosed in a bevel gear case casting N, which is brazed on to the back stays of the machine. The clutch is operated by a Bowden wire, which when in tension pulls the collar O against a spring P and so allows the wedge pins Q to fall down and the plates to be disengaged. When the Bowden wire is not in tension the spring P comes into operation, forcing the taper collar O inwards, which in turn forces the wedge pins Q between the two discs so engaging the plates attached to the sleeve M and the main hub. It will be noted that ball bearings are used throughout in the back hub.

Attached to the main drum R is the back rim, which is built up with tangent spokes in the usual method.

The engine in question was run for a period of two hours at 4,000 revolutions on the stand, that is to say, the cylinders revolved 2,000 r.p.m. in one direction and the flywheel 2,000 in the other, which they did perfectly satisfactorily without undue heating or breakdown of any kind, and the lubrication throughout was perfect.

## Formulae for Flexibility Hill-climbs.

THE usual method of deducting the fast time from the slow and giving first place to the rider who can show the greatest difference between his time has the merit of simplicity, but, having said that, we have said all that can be urged in its favour, for in every other respect it is sadly wanting. For instance, two machines of equal weight and horse-power compete; the first does its fast climb in 60s. and its slow in 240s., the difference being 180s., and the slow climb takes four times as long as the fast. We will suppose that the second occupies 90s. and 270s. in its two climbs; again the difference is 180s., but in this case the fast climb is only three times as fast as the slow. This performance is certainly less meritorious, but the figure of merit is the same. The Ayr and District M.C.C., lately adopted a better

formula, viz.,  $\frac{\text{slow} - \text{fast}}{\text{slow} + \text{fast}}$ . The above examples

worked out by means of this formula give .6 for the first performance and .5 for the second. This is certainly an improvement, but it takes no account of weight and horse-power. Now it is obvious that a powerful machine with a light rider should not only be able to make a faster climb than one of less power or more weight, but it should also be able to ascend the hill more slowly without coming to a standstill; therefore under the present conditions powerful machines should win every time.

It is hardly possible to devise a formula which should be fair to all sizes and weights and yet compete with the one in use on the score of simplicity, but we are sure that club secretaries would prefer to take a little more trouble and get fairer results. We therefore suggest the following formula, each part to be worked to three significant figures and the results added together. The first part is to be calculated for the fast time and the last for the slow

$$\frac{1,000 W}{C \times t^2} + \frac{W \times t}{1,000 C}$$

This formula allows for weight and horse-power (or capacity, which should be the same thing), and the example we have given works out as follows (taking the weight to be 350 lbs. and the cubic capacity as 500 in each case). First machine:

$$\frac{350 \times 1,000}{500 \times 60^2} + \frac{350 \times 240}{500 \times 1,000} = .362$$

Second machine:

$$\frac{350 \times 1,000}{500 \times 90^2} + \frac{350 \times 270}{500 \times 1,000} = .275$$

For the slow climb  $t$  is taken instead of  $t^2$  because the wind resistance at slow speeds can be neglected. If the weight of the first machine had been 400 lbs. the figure of merit would have worked out to .414. And a lightweight of 350 c.c. and 330 lbs. weight would score .489 on the same time figures, and deservedly so, for it is a finer performance

## QUESTIONS & REPLIES

SRJ

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Machine in Stable.

[?] I am unable to keep my motor cycle and sidecar at home, having no room, but I can hire a disused coach-house near.

There is a stable adjoining, separated only from where the cycle will be by a wooden partition, and I am told that the ammonia fumes from the stable manure will be detrimental to the metal. Do you know if this will be so?—G.E.W.

The fumes from stable manure, etc., do slightly affect the brilliancy of the plating, but they have no other effect on the metal.

### Fitting New Piston Rings.

[?] (1.) How could I fit a new piston ring to my  $3\frac{1}{2}$  h.p. J.A.P. engine, as the compression is weak, and I find this is the fault? Should be pleased if you would give me a little information as to grinding a new piston ring. (2.) What tools should I require?—H.R.

If the piston rings in your engine are really badly worn, the best plan is to send the piston complete to the makers of the engine and let them fit the rings for you. Do not attempt to grind them in, as running them in the cylinder will do all that is required. If you order a standard ring from the makers it is possible that the grooves may be worn and ring will be too slack.

### Single or Twin.

[?] My experience only having gone so far as a Douglas, and the running or "pull" of this being so pleasantly smooth, I am in doubt. (1.) Should I tackle a  $3\frac{1}{2}$

h.p., the cylinder being the usual  $85 \times 88$  for 1912, whether I shall find the pull very much more "jerky," as I travel at no great speed? (2.) If a F.E. pulley has many drawbacks against a hub clutch? (3.) Whether magneto chain drive is likely, within a reasonable running time, appreciably to alter the "timing" by wear, or is it of no consequence? Some good makers, I note, still use chain drive.—A.W.T.

(1.) You would not find a single-cylinder quite so smooth running as a twin, but the modern single-cylinder is well balanced and you would not find the vibration to be objectionable or even perceptible. (2.) No, if well-designed a free engine pulley is as good as a hub clutch. (3.) Chain-drive, if kept adjusted, is quite satisfactory in the case of magneto ignition.

### Kilmarnock to Canterbury.

[?] (1.) Do you think I shall be able to undertake a tour from Kilmarnock to Canterbury with my 4 h.p. Rex and sidecar with fixed gear, myself and passenger weighing about 22 stones? (2.) What would be the average speed per hour you would recommend without overworking engine? (3.) Does a N.S.U. two-speed gear make more noise than a Rex or a Roe hub gear, and does it splutter the oil over belts, etc., when in motion.—H.W.

(1.) Yes, we think you could accomplish the journey if your machine is running reliably. The following is a good route over good roads all the way: Kilmarnock, Mauchline, Cumnock, Sanguhar, Dumfries, Carlisle, Longtown, Alston, Middleton - in - Teesdale, Barnard Castle, Scotch Corner, Boroughbridge, Wetherby, Aberford, Doncaster, Bawtry, Retford, Tuxford, Newark, Grantham, Stamford, Stilton, Huntingdon, Saffron Walden, Thaxted, Dummow, Chelmsford, Billericay, Tilbury, by ferry to Gravesend, Rochester, Chatham, Sittingbourne, and

Canterbury. (2.) If you averaged 16 m.p.h. you would do fairly well. (3.) The gear is quite satisfactory and makes no more noise than other fast running gears; it does not fling the oil about, as it is protected with a shield.

### Oilways in Pistons.

[?] I have a 1912 Triumph and would like to know if you advise having oilworms cut in the piston. This tip was given me by a T.T. rider, and the advantages were—(1) very easy starting and (2) more speed. This idea has been adopted by a friend who rides a  $3\frac{1}{2}$  h.p. Precision-engined machine. Both these riders ride high compression engines that will touch over fifty miles, and are "speed" merchants. Before taking their tip I should like your advice. My object in asking is on account of the easy starting. Speed—that is, excessive speed—is not my desire.—A.B.H.

We cannot think that it would be otherwise than beneficial to have oilways cut in your pistons. Provided the job is well carried out no harm could possibly result.

### ESSEX M.C. RUN FROM SNARESBROOK TO YORK AND BACK.

A rest by the way at the top of Gonerby Hill, near Grantham. Reading from left to right the riders on the roadside are: A. E. Brassington, who rode a 6 h.p. Rex sidecar, R. Lord (6 h.p. Rex sidecar), G. E. Revill (6 h.p. Zenith), W. Cooper (3½ h.p. Bradbury), and J. H. Campbell (3½ h.p. Rudge). Standing in the road may be seen C. F. Michell with his 6 h.p. Bat-Jap sidecar.

**Fitting a Sidecar.**

Q

I have a Scott motor cycle with sidecar attached which is difficult to steer. The wheel of the sidecar is quite 2in. behind the back wheel of the motor cycle. Do you think this is the cause of the bad steering? The front wheel of the cycle seems always to be being pulled in the direction of the sidecar. The man who fitted the sidecar says that it is better to have the sidecar wheel running further back than the back wheel of the motor cycle.—M.H.

We should strongly advise you to put the sidecar farther forward. We should think that with the sidecar wheel in front of, or level with, the rear wheel of the bicycle the steering would be better. Of course, with a sidecar machine there is always a slight tendency to pull to the near side.

**Misfiring.**

Q

About a week ago my machine got very hard to start, but when once going went fairly well. Shortly after this it started misfiring occasionally. I put in a new plug, freshened platinum points, and put them closer. The first day I then rode it it went perfectly for ten miles, when it began to misfire occasionally. I put in an old spare plug, which improved matters somewhat, and brought me home. It again got hard to start, but I put points of plug closer. This made it start easier, but misfiring continued at all speeds, and I think the engine gets hotter than it used to. I have had magneto cleaned; the condenser was a little loose, but on trying machine to-day it went as badly as ever.—T.C.

We should be inclined to think the trouble is entirely due to the fact that the fibre ring is worn. If you replace this, we think the machine will run as well as ever. Do not run with the plug points too wide apart. This would cause misfiring at slow speeds and difficulty in starting.

**How to Avoid Bristol Traffic.**

Q

I should be very much obliged if you could indicate a route to avoid Bristol coming from Gloucester. I want to get to Highbridge and avoid Red Hill and Dundry Hill. The map does show a road, but it is not sufficiently plain to enable one to be certain.—J.S.B.B.

You can avoid Bristol by turning right at Filton, about five miles short of Bristol, just when you meet the Bristol trams; the road then bears left, and before you come to Westbury-on-Trip you turn left up a shady lane. This brings you on to Clifton Down, cross this, keeping fairly near the houses at the side, and go down a winding road at the water's edge; then cross the new bridge (not, of course, the Suspension Bridge), and you will find yourself on the Long Ashton Road; go through Flax Bourton, Congresbury, Stock Lane, and Churchill. This place is on the main Bristol-Taunton Road, not far short of the Mendips. If you prefer you can cross the Suspension Bridge (toll) and go down a very steep, short hill to the left. It might be as well to enquire for the new bridge when you get to Clifton Downs, as there are many roads, and it is easy to make a mistake.

**Silencer Dimensions.**

Q

As I understood from *The Motor Cycle* of August 1st that another A.C.U. silencer trial is to be held, I shall be obliged if you will kindly favour me with the dimensions of the final silencer, together with all particulars as to time and place of trials, as I wish to enter for this competition.—J.W.

Full particulars regarding the preliminary report of the silencer trial appeared in *The Motor Cycle* of August 1st, page 871. The committee decided that the silencer which would give the agreed standard of quietness should be made up in a size 5in. in diameter by 12in. long, with an outlet pipe 10in. long, and 3in. bore. Further particulars can be obtained from the secretary of the Auto Cycle Union, 89, Pall Mall, S.W.

**Friction Drive on Small Car.**

Q

I have a desire to fix up a friction drive on a small car, weighing 8-9 cwt. loaded. Will you kindly give me the following information? (1.) What ratios of gear (reverse also)? Back wheels are 28in. (2.) What size should disc and friction wheel be to be most efficient? (3.) Where is it best to put large wheel—on counter-shaft or engine? (4.) With this drive, is the ordinary clutch done away with and the engagement of disc with wheel in lieu thereof?—J.H.S.

(1.) The ratio of gearing depends entirely on the h.p. of engine, but presuming this is about 6 to 8 h.p. the top ratio should be somewhere in the neighbourhood of 5 to 1, and the bottom or lowest ratio about 12 to 1. The reverse, in the case of a friction drive, could not be very much lower than the lowest forward ratio because the diameter of the friction discs defines the gear. (2.) This query we cannot answer, as the efficiency depends on the design of the friction gear. The average size is: disc 2ft., wheel 9in. to 12in. (3.) The large friction disc is usually placed on the counter-shaft. (4.) Yes, releasing friction drum from wheel

acts as a clutch. We are sorry we cannot give you definite replies to your queries on this manufacturing subject, but it is really somewhat without our province. We are willing to give replies to queries on the handling and upkeep of motor cycles, but in the case of designing a vehicle so many things have to be taken into account that it is extremely difficult to give advice which will be of any service in such cases as your own.

**EXPERIENCES WANTED.**

"Newland" (Hull).—G.W.K. cyclecar. "G.F.D." (Stourbridge). -- Morgan runabout.

"A.W.K.S." (Salisbury). -- Enfield Autorette.

"J.S.A.J." (Holloway).—Morgan and G.N. cyclecars.

"R.H.S." (Rochdale).—Variable gear and free engine suitable for fitting to 1908 twin Rex.

"Novice" (Fulham).—1½ h.p. Moto-sacoché, as regards speed, petrol consumption, and hill-climbing.

"D.K." (Wargrave).—6 h.p. 1912 Speed King Rex and 7-9 h.p. Indian. Reliability and speed.

"R.M.D.T."—Clyno and T.M.C. sidecar machines. Wear, reliability, ease of starting and petrol consumption.

"S.V." (Bishop's Stortford).—Douglas 2½ h.p.; two-speed, with free engine clutch, for hill-climbing and reliability.

"J.B." (Ditton).—1912 Scott with sidecar. Petrol consumption, wear of chains and tyres, and particularly as regards keeping in tune.

"Delta" (Australia).—T.M.C. and sidecar, general efficiency and strength for rough touring, and petrol consumption. Also as a solo mount compared with other makes.

If "F.P." (Tilehurst), "W.B.G." (Penrhiwceiber), "M.H.S.K." (Ashted), and "A.B." (St. Leonards-on-Sea) will comply with our rules and send stamped envelopes their queries will be answered.

**AT FULL SPEED UPHILL.**

Half way up Woodway Hill, in the Coventry and Warwickshire M.C. open hill-climb, which attracted 196 entries.

# OCCASIONAL COMMENTS.

By "IXION."

## The Dulness of the Average Hill-climb.

Keen motor cyclist as I claim to be, the average modern club hill-climb bores me to tears. I have attended a few this summer, and except under pressure of business I hope I may never be present at another. For inevitable reasons a dull, straight road is usually selected, and if the rapid ascent of the first two or three machines can still stir a faint thrill in my jaded nature, I grow uncommonly sick of the gatling-gun procession before the entry is worked through. Nor do these climbs retain the old technical interest. Time was when immense gaps separated engine from engine and rider from rider; to-day success is more a question of which expert can coax the greatest excess of power from a dozen engines of different makes, which are normally much of a muchness, and only fractions of seconds divide the half-dozen men at the head of the results list. To enjoy a hill-climb nowadays, one has to accompany a Six Days' Trial and see anxious men with carbonised engines and variable gears essaying the conquest of freak hills. The speed sprint up a short, easy hill commands no more interest than resides in the rivalry of factories and the personal achievements of our friends and acquaintances. I should think the sprint hill-climb will decline in popularity, as was the case with push-bicycle climbs and free-wheeling contests.

## Ugly Transmissions.

Ardently as we have clamoured for weatherproof transmissions, the ugliness of some examples I have recently examined comes as a rude shock. It is a pity that, just when we have evolved graceful machines with artistic outlines and colouring, the demand for a fully enclosed drive should cause the production of such hideousities. I suppose for the moment we must be ready to sacrifice beauty to efficiency, but the most graceful machine becomes a horror when two or three chains are provided with awkwardly shaped metal covers. I wonder if anybody has experimented with an *enclosed shaft* as the primary unit of a two-step drive? A drive consisting of an enclosed shaft transmitting the engine power to a counter-shaft, from which the final drive was by belt, could remain as neat of aspect as any direct belt drive, and I see no reason why such a design need import any practical defects. [The  $2\frac{1}{2}$  h.p. and 4 h.p. Singer's are on the above lines, the shafts being parallel.—ED.] Without doubt the fully enclosed primary chain is far from pretty. Big sprockets are essential to the life of the chain, and the counter-shaft sprocket must be at least twice the diameter of the engine sprocket, if the smaller belt pulley is to be large enough to secure absence of belt slip and prolonged belt wear; the result is a grotesquely large chain case, which forms a blot on the neatest design, so far as looks are concerned. The bearings and tooth-meshing of such a shaft would, of course, be adjustable; and with good steels the wear need neither be rapid nor excessive, though there might be an increase of cost.

## Belt and Chain Tests.

The A.C.U. belt tests proved of very limited value, except to indicate to the general public that, although

$\frac{3}{4}$ in. and  $\frac{7}{8}$ in. belts are frequently supplied on  $3\frac{1}{2}$  h.p. machines, yet when a public trial is imminent, motor cycle makers and belt makers regard 1in. belts as more satisfactory. Why were no chain tests incorporated in the Trial? It would be interesting to have authentic official information about chain wear, and especially about front chain wear, since the combined drive is attracting so many designers, and reliable chain information is almost unprocurable. I meet one man who says he scarcely ever touches either front or back chains; and then I meet another owner of a similar machine who says that he cannot get more than 1,000 miles out of his front chains. If I were a manufacturer in process of selecting a transmission for my 1913 models, I think I should buy three Douglas machines (as being most susceptible to certain obvious experiments). One of them would be direct belt-driven; I should put a three-speed hub in its back wheel, and run the best belt I could get to destruction in the hands of one tester. To another tester I should entrust the second Douglas machine, a standard two-speed model, with combined drive, and I should verify the behaviour of its belt and chain very carefully. The third Douglas machine I should pull about not a little; I should fit a spring device on the engine sprocket, and remove the back belt altogether, substituting a second chain; and the third tester would give these chains a rare gruelling, both with and without covers. At the end of three months I should have spent some money, but I should know all I desired to know about transmission, and my customers would reap the benefit next season. I might even go further, and fit a fourth Douglas with enclosed shaft drive from engine to gear box. Incidentally I should acquire a little special knowledge about the effect different transmissions have upon tyres; but this information would be less reliable, as the tyre wear would depend to some degree on the idiosyncrasies of the testers. As it is, I am a mere quill-driver, tied down to speculation and partial experiments.

G. L. Fletcher (2<sup>nd</sup> Douglas sidecar) with the smallest sidecar outfit in the Essex M.C. London to York trial. On the return journey he collided with a cart near Grantham.

**"D**ARE DEVIL MARTIN," as the famous pioneer is called, has been a winner since the inception of the motor cycle movement, and won the first open race promoted by the M.C.C. at the Crystal Palace in February, 1902.

Since that time he has won over 250 first prizes, and was the first Britisher to cover a mile in a minute. His best work has been done on saucer or grass tracks, although he has also ridden conspicuously at Brooklands. His experience is related by him as follows:

"My most exciting ride?"

Well, I have no hesitation in stating that out of the 400 odd races and record trials I have been engaged in during the past ten years, one ride alone stands out as the most exciting and hair-raising experience of my racing career.

"On April 13th, 1908, I decided to go out for world's three lap records for single-cylinder machines up to 200 miles, and continue up to six hours if conditions were favourable. The machine selected was a single-cylinder 'Matchless-Jap' with a cylinder bore of 85 mm. and a stroke of 75 mm. The brothers Collier, in company with Colver and a mechanic, came over to the track, and like the sportsmen they are rendered me every assistance. All being in readiness, a start was made on receiving the necessary signal from the official timekeeper, Mr. A. V. Ebbelwhite, at 11.30; the machine running well I was soon inside record, only to be put out of action by a bent valve stem. Two other attempts were also fruitless from one cause and another, and it was at last decided to dismantle the machine.

#### A Final Start.

"The machine was finally assembled and ready for the final and last attempt about 3.50, the word to 'go' being given at four o'clock. At the start the weather was bitterly cold, with a strong N.E. wind blowing, several hailstorms also making matters worse, the general conditions being altogether quite unfavourable from a record breaking point of view. The machine ran beautifully, and with great regularity, and in accordance with my schedule I got inside record at 101 miles, time 2h. 15m. 21 $\frac{1}{5}$ s., beat-

ing previous best by 1m. 3s. From this point all three lap records continued to go with monotonous regularity, a stop being made in the meantime at 120 miles to refill tank and change tyres. No trouble was experienced with the machine beyond tightening a belt at 213 miles.

"Soon after 7.30 darkness rapidly enveloped the track, and by 8 o'clock it was almost impossible to see the bankings; a kindly signal warned me to stop. This I neglected, together with other signals, and decided to go on, if possible, for the full six hours. The darkness was so intense that the timekeeper found it impossible to see the machine crossing the line, with the exception of a 12in. long blue flame from the open exhaust of my J.A.P. engine.

#### Finish in the Dark.

"Two ordinary cycle lamps were therefore brought into use, one being placed on the outside of the finishing line, and the other in the timekeeper's box for the purpose of obtaining exact lap times. Speed on the banking by this time was a matter for extreme care. The lights shot by me each lap, the bankings

being taken at an angle automatically without actually seeing them, and this for nearly two hours!

"I had the satisfaction, however, of also learning from the timekeeper that I had beaten Anzani's continental three lap record by 25 miles and British record by 17 miles, the figures from 200 miles still standing for single-cylinder machines on a three lap track."

In the judges' report of the tyre trials in the 1,000 miles the set of Rom tyres fitted to R. C. O. Wells's 3 $\frac{1}{2}$  h.p. Bradbury were omitted. These were a 26 x 2 $\frac{1}{2}$ in. cover for the back wheel, fitted on a 2 $\frac{1}{4}$ in. rim, and a 2 $\frac{1}{4}$ in. tyre on the front wheel. The type of tyre used was the combination non-skid. The judges report that the tube was changed owing to a puncture, reason not known. The cover on the back wheel was weighed at the end of the trial, and showed a gain of  $\frac{1}{8}$  oz., and in the case of the front tyre 3 $\frac{1}{2}$  oz. loss. The tubes were both in good order. The front cover was in excellent order, and the back cover showed a slight wear on the tread, but otherwise was in excellent condition.

## LIGHT RECIPROCATING PARTS.

THE advantage in increased engine speed to be gained by light pistons and connecting rods is very great, and numbers of firms have experimented with steel pistons. We understand from the Oxygen Welding Works, Ltd., New Summer Street, Birmingham, that the cause of dissatisfaction in connection with steel pistons has been that hot steel stampings have

The Duplex piston ring.

been used. It was explained to us that when a hot steel stamping is used for the purpose, considerable expansion takes place when the piston has been machined and becomes hot in use owing to the inequality of the metal. The Oxygen Welding Works, Ltd., are making the Simplex patent steel piston from cold drawn weldless steel tubing, and it is claimed by them that this prevents unequal expansion owing to the uniformity of the original steel tube from which the piston is constructed.

Oxygen welding naturally enters very largely into the construction of this firm's

patented specialties, the cap of the piston being welded in to the top of a short length of tubing, the ears or lugs for the gudgeon pin being also attached to the walls of the piston by the same process.

In conjunction with the piston a special ring is supplied called the Duplex patent. Examination of this ring is at first somewhat puzzling, because one wonders how the ring has been made with ground surfaces on the edges where the two circles touch. The explanation is simple, but it is one that has to be explained to nearly everyone who sees it for the first time because slitting and cutting in connection with piston rings is the first process that occurs to one.

The Duplex ring is made by taking two ordinary rings with wide slots and welding them together after the surfaces have been ground dead flat. The weld is at the point marked with dotted line in the sketch. An ordinary 85 mm. piston used in a well-known make of motor cycle was handed to us by Mr. Patrick, the firm's representative. This weighed 1 lb. 10 ozs. He then placed in our hands a Simplex piston of 85 mm. which weighed 13½ ozs., just about half the weight. Several motor cyclists have fitted these pistons to their machines, and practically every one has found a tremendous increase in speed owing to the lighter parts. Another great advantage of the steel piston over a cast iron one is that when a cast iron piston has been

machined it may be dropped on the brick or stone floor of the shop, and being unannealed cast iron, it will immediately break.

If a steel piston be dropped all that can possibly happen is that it may be knocked out of truth slightly, which is easily rectified by grinding. The Simplex piston and Duplex rings are beautifully finished, and the firm are in a position to supply them to fit any make of motor cycle on the market.

Hollow connecting rod, made in two halves and joined by oxygen welding.

Another interesting and most ingenious article made by the same firm is the hollow connecting rod of which we illustrate a section cut away to show the method of construction. This connecting rod is half the weight of an ordinary stamping, and is made by pressing the two halves separately and afterwards welding them together along the centre, oxygen welding, of course, being employed for this purpose. Bosses consisting of short pieces of steel tubing are inserted at each end to form supports for the phosphor bronze bushes. These are also welded into place.

## ENTRIES FOR THE B.M.C.R.C. BROOKLANDS MEETING.

On Saturday next, the 14th inst., the above meeting will take place. One of the principal events is the 150 miles race, which, it will be remembered, was postponed from Saturday, August 24th, and for which the following is a list of entries:

Name, cyls., and make.	c.c.
H. Martin (1 Martin-Jap) ...	339
H. C. Newman (1 Ivy-Precision) ...	346
H. Petty (1 Singer) ...	299
W. A. Jacobs (1 Singer) ...	299
J. P. Le Grand (1 Singer) ...	299
S. R. Axford (1 Martin-Jap) ...	493
J. R. Hayes (1 Hayes-Pankhurst) ...	499

J. W. Woodhouse (1 Regal-Precision) ...	499
H. C. Mills (1 Green-Precision) ...	499
S. F. Garrett (1 Green-Precision) ...	499
V. E. Horsman (1 Singer) ...	499
W. H. Elce (1 Rudge) ...	499
W. Stanhope Spencer (1 Rudge) ...	499
S. R. Cooke (1 Rudge) ...	499
V. Taylor (1 Rudge) ...	499
C. R. Martin (1 Triumph) ...	499
W. Edmondson (1 Triumph) ...	499
W. Dewar (1 Triumph) ...	499
J. R. Haswell (1 Triumph) ...	499
Alf. Miller (1 Premier) ...	499
— Hatcher (1 Premier) ...	499
J. Oliphant (1 Premier) ...	499

J. L. E. Emerson (1 Norton) ...	490
A. B. T. Bashall (2 Douglas) ...	345
J. T. Bashall (2 Douglas) ...	345

S. W. Phillpott (2 Humber) ...	345
H. E. Govett (2 Humber) ...	345
J. Harrison Watson (2 Humber) ...	345
A. E. Woodman (2 Humber) ...	340
R. Nison (2 N.U.T.) ...	350
H. Mason (2 N.U.T.) ...	347
H. H. Clark (2 Corah-Moser) ...	344
S. R. Axford (2 Martin-Jap) ...	498
H. V. Colver (2 Enfield) ...	348
H. H. Huckle (2 Zenith-Jap) ...	494

A NEW SIDECAR, built for Monsieur Chartier Desvarennas, president of the M.C.C. de France. The body is of hasketwork, with a wind-cutting front and side door. A miniature Cape carl hood is fitted, and a wind screen which allows the passenger to enter the sidecar while the screen is fixed in position. The screen is permanently attached to the hood and buttoned to the sidecar front when the hood is brought forward.

# LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

## Waterproof Glue.

Sir,—(1.) Soak glue in water and when soft pour off excess of water, melt the softened material and add bichromate of potash (one ounce melted in half a pint of water), keep in the dark till required, melt by heat and apply.

(2.) Make glue with linseed oil instead of water in the ordinary way.

**MUDPLUGGER.**

## Pen-y-Ball Hill-climb.

Sir,—On examining results of the Mersey M.C. hill-climb at Pen-y-Ball in your paper, August 8th, 1912, I notice you say the only adult passenger was Mrs. Baxter, who went up in a Williamson and sidecar, and the other competitors carried local children. This is hardly correct. I entered my 8 h.p. 1911 Matchless and sidecar and gained the club's silver medal for members, and my passenger was Mr. W. J. Derbyshire, whose weight is about eleven stones. I would not take a child because of the risk.

ALBERT MARSTON.

## Combined Chain and Belt Drive.

Sir,—I have been prevented from answering "Ixion's" few remarks on my previous letter before this, and trust I am not yet too late to be allowed to do so.

It seems that "Ixion" has missed the main argument of that letter. I asked why it was necessary to retain the belt in this "two stage drive"—why not complete the improvement and adopt the complete chain drive?

I still hold the view that the belt is the weakest part of the combined drive, and "Ixion" does not dispute the point. His claim that the greater popularity of the belt proves it to be the best form of drive is no argument at all in its favour. The popularity of the belt has nothing to do with the belt's fitness as a drive. The belt has always been popular, and will remain so for some time. Its popularity is due to several causes quite separated from its own achievements. The first is its cheapness in first cost, the second is that when new it serves the purpose of showing off the capabilities of an engine in a short race or hill-climb equally as well as does a chain, but its life is very short in comparison, but more machines are sold by what they have done on the race track or hill-climbs than by their "road worthiness." Thirdly, the makers will still continue to boom the belt in preference to the chain because of its slight saving in first cost to them. In this the press has generally upheld them, for what reason I cannot understand. [As far as we are concerned we deny this.—ED.]

In the past the only chain-driven machines procurable were either non-racing machines, or ones that had defective chain drives—no slip clutches. To-day things have altered, the chain, notwithstanding these setbacks, is becoming more common every day. I can think offhand of sixteen makers who are making a chain-driven model, and probably there are more. Some of these do not fit slip clutches, which is a mistake. This fitting is as desirable to a chain drive as a correct belt angle on belt and pulley is to the belt drive. These remarks refer to the direct belt drive.

Coming now to the combined drive. The first cause of the belt's popularity disappears. The combined drive and the chain drive cost practically the same. Then why should the makers, if they are at last going to spend the money, give up the more durable and consistent drive? That is my point.

In a great measure I think the makers will not go right at the chain drive because the average motor cyclist has been schooled by the press and hearsay so continuously that the general ignorance in regard to chain drive would affect their

sales. There are only a few firms with strong enough convictions to make chain-driven machines only, and of these the ones that have gone in for the racing side of motor cycling have carried off the most trying records—the T.T. and the Grand Prix of France. The chain has had a certain amount to do with these results.

"Ixion's" reasons for the growing popularity of the combined drive are erroneous. The main cause for this is the growing popularity of the gear box speed gear, and the impossibility of using the belt between the engine and the gear box. As a further illustration of the fallacy of "Ixion's" popularity idea, you have only to go back a few years when the magneto was in a very small minority. The accumulator was the more popular, and, I suppose, "Ixion" would say it was better in consequence. To-day, of course, the magneto is more popular, and has always been better than the accumulator from the very first day it was put on the market. The two systems are to-day practically the same as they were seven or eight years ago. The motor cycling public are longer in discovering the superiority of chain drive, although its superiority has been before them for at least nine years.

"Ixion" says he once had to adjust his chain eight times in a month. This was very evidently not due to any defect in the chain drive, as he infers, but to the fact that his back wheel spindle was either badly fitted or badly made. Such a fault on a belt-driven machine of "Ixion's," I suppose, would be traced to the correct cause right away.

There are one or two other points in "Ixion's" reply I should like to criticise, but I think this is already too long a letter.

T. F. MAW.

## The Definition of Cyclecars.

Sir,—I notice in your issue of the 29th ult. an article describing the Singer Motor Company's so-called cyclecar. I think most people who know anything about the subject

A proof of the lightweight of the Singer cyclecar chassis.

will agree that it is unfair to describe it as a cyclecar. From the illustrations it appears to be a beautiful piece of work, and I am not saying anything against the car as a car, but I want to bring home to those interested the fact that there is still something lacking in the definition of a cyclecar when a perfect motor car in miniature is labelled with the same name.

JOHN D. ROWLAND.

### Wear of Clutches.

Sir,—We note in your article on change speed gears the writer says that a properly designed clutch should last a season or 5,000 miles. It may interest you to know that the clutch on the Veloce test machine, that is our patent two-speed gear engine with forced lubrication, has now run 7,000 miles. Out of this distance, probably 1,000 miles with a sidecar, and is to-day as good as ever.

We also notice our name mentioned in an article on lubrication. There has not been the slightest hitch with the Veloce test machine, and, as mentioned in the article, the lubrication is perfect. VELOCE, LTD.

### Reliability of Belts.

Sir,—Evidently your correspondent, Mr. Sharrock, has not been fortunate in his choice of belts. I have a 1½ in. Dunlop which has done 2,300 miles on a 6 h.p. Matchless and sidecar by speedometer. It has not broken yet, and has only been shortened twice. There is not a crack in it, and it looks good for a long distance yet. HA 218.

### The Lubrication of Two-stroke Engines.

Sir,—In your report of the recent Six Days' Trials you comment on the smoking propensities of the two-stroke machines.

Undoubtedly, excessive oil consumption is the besetting sin of this type of engine. In their endeavour to ensure a regular supply of oil makers of these machines fit an automatic lubricating device, but the success of this is to a large extent nullified by retaining the frame tubes as an oil reservoir. These tubes represent a tank of a capacity of less than a quart with a superficial area of only a few square inches, but with a height of 14 in. to 15 in., consequently the oil level rapidly descends, giving a constantly decreasing pressure at the outlet to the engine. It thus follows that if the controlling arrangement is correctly adjusted when the oil tubes are, say, half full, with the tubes filled the engine sucks more than it should and *vice versa*.

With the idea of maintaining a more even oil pressure over a longer period I fitted to a 1912 machine an oil tank behind the petrol tank in the space immediately under the saddle. This having a large surface would hold a quart of oil in a depth of 3½ in., and gave a much more regular supply of oil to the crank cases over several hundred miles without re-adjustment.

After a comparatively small mileage (about 800 miles) one of the packing glands on the crankshaft ceased to be compression-tight, and the automatic lubrication on that side was upset altogether. When these glands fail the oil drawn in by the suction stroke is ejected on to the chains by the succeeding compression stroke and very little gets into the crank case at all.

CH. STUART BIRT.

### The Wear of Bearings. Importance of Efficient Lubrication.

Sir,—An article under the above heading, signed "A.G.D.C.," appeared in *The Motor Cycle* for August 23th. This article contained a reference to the Veloce and the W.D. machine. One of the former machines was referred to as having been dismantled after having done much work, and reference was made to the absence of wear in the bearings and of carbon deposit in the cylinder. The writer then went on as follows: "Here, then, is the problem already solved—forced lubrication under a pressure of 10 lbs. per square inch is employed, and bearing wear vanishes to a negligible amount."

While in no way wishing to detract from the merits of this machine, the makers' description of the engine shows that ball bearings are employed on the main engine-shaft and gearshafts, and the oil is mechanically fed into the gearshafts, whence it is flung on to the big end of the connecting rod. The circuit is open-ended, and there can be little or no pressure. So that the writer's statement, although applicable to the W.D. engine, does not apply in the case of the Veloce. We believe we are right in saying that the former engine is the only motor cycle engine employing a complete system of forced lubrication to all the engine bearings. W.D. MOTORS.

Sir,—The short article by "A.G.D.C." on this subject struck me as being very sound, but he does not go quite far enough, and suggest how forced lubrication is to be adopted with the present type of motor cycle engine.

I have long held the opinion that the only satisfactory way is to drop the old-fashioned built-up crank design and go in for a solid crankshaft drilled for lubrication and an outside flywheel. Only in this way is it possible to get bearings large enough to stand up for 10,000 or so without some wear. There would be the further advantage that white metal could be used in the big end bearings, and moreover the amateur could take his engine apart and reassemble it without recourse to a lathe to centre up his crank and flywheels as is necessary at present.

It can be shown that the solid crank design does not mean increased weight—rather the reverse. There is a great deal of useless weight (from the point of view of utility as flywheels) in the present inside flywheel, which has to be made rather heavy at the web on account of the ends of the crank pin being fixed therein.

With an outside flywheel no such necessity arises—the web can be made lighter and nearly all the weight concentrated in the rim, where it is of the greatest advantage in making a smooth and slow running engine. With the use of variable gear, the necessity for the engine to be able to run slowly when the machine is stationary is obvious. But how few engines can, and what an unpleasant "racing" is usually heard. Here the outside flywheel scores tremendously.

In this connection I may mention an ingenious oil pump for forced lubrication which it seems to me, would be

A single geared 2½ h.p. Ivy-Prec's on sidecar (H. C. Newman driving) in the passenger class at the Coventry and Warwickshire M.C. Open Hill climb. The standing start rule prevented the single geared mounts scoring, as many seconds were lost in starting the machines. Note the passenger's position.

admirably adapted for a motor cycle engine with one-piece drilled crankshaft.

It is embodied in a certain make of two-cycle petrol stationary engine of the displaced pump type known as the Richards engine. It consists of a small oscillating valveless pump situated inside the oil sump, from which it draws oil, and driven by an eccentric formed on the crankshaft. This eccentric and its strap are made to act as the necessary valve. The oil passes up the hollow pump spindle into the eccentric strap, where a "hollow" is formed for its reception. As the eccentric moves round, this hollow registers with a hole drilled in the eccentric, and the oil is forced through this hole and thence into the shaft and so to the bearings. I know, from personal experience, that this system works admirably; there is an entire absence of external oil pipes, all the apparatus being inside the sump. Regulation of flow is obtained by a needle valve throttling the pump suction operated by a milled nut from the outside.

There is no doubt that motor cycle engines do wear their bearings out far too quickly, and there is every reason why they should, with the crude lubrication system makers still cling to.

The only way is to get the flywheels out of the crank case, where they only serve to starve the bearings of oil. It is disappointing to see new firms entering the motor cycle field and still sticking to the old hand lubrication. I do not consider the use of a sight feed pump drip in conjunction with the hand pump any improvement at all. The most urgent reform necessary to-day is the improvement of the lubrication system. Who nowadays would look at a car with only a hand oil pump? Yet in 1912 makers are not ashamed to ask £60 for a machine fitted with this obsolete apparatus.

P.W.M.

#### A Strange Proceeding.

Sir,—The letter in last week's issue of *The Motor Cycle* signed "H. Percival" is really quite alarming. May I ask if he has really stated all the material facts? If so, as a motor cyclist I sympathise with him, and as a solicitor would tell him that the learned J.P. had no more right to extort money from him with threats than a highway robber has. It is, to my mind, a monstrous abuse of petty authority, and I am surprised that anyone should submit to it, even though it emanate from a carriage and pair. Motorists already contribute sufficient to the maintenance of our national tribunals of justice to entitle them to be heard and receive proper judicial consideration therein. E.C.B.

#### Cornering in Cyclecars.

Sir,—“Ixion,” writing in last week's issue of *The Motor Cycle*, makes a statement with regard to cyclecars which we cannot allow to pass uncorrected. He states that the driver of a cyclecar must not corner on these light vehicles as daringly as he would on a small car weighing 10 to 15 cwt. We have little experience with other cyclecars, but with regard to the G.W.K. cyclecar this statement is most emphatically wrong. We believe that it is practically impossible to turn one of these cars over in taking a corner fast. We have made repeated attempts to see if we can get these cars to tip, and have so far only succeeded in wrenching the tyres off the wheels.

By our method of suspending the engine low down in the frame, and seating the passenger also low down, there is not the least sensation of tipping, however fast a corner is taken, and the danger of upsetting a G.W.K. is not so great as of upsetting a heavier car, after having been in the habit of driving one of our small cars, by taking the corners at the same speed that one can safely do with a G.W.K. G.W.K., LTD.

Sir,—Regarding “Ixion's” warning *re* cyclecars in your paper last week, I would like to say that he is quite in error, as several of the four-wheel type I have tried are quite free from anything of the sort.

The Rollo I had was quite good at corner work, and while one does not advocate fast driving round corners, it sometimes happens that a smart move of this sort would save an accident.

I think you should correct this so as to give the public confidence, and if you have doubt in the matter, I would be willing, in the interests of the public, to give a demonstration anywhere.

DENIS ROUND.

#### The Judges' Report on the Six Days' Reliability Trials.

Sir,—*Re* judges' report on the Six Days' Reliability Trials the judges say, “Excessively long belts used on such machines as the Duocar would appear to be a likely source of trouble, owing to the tendency under certain roads and driving conditions towards undue oscillation and possible twisting of the belts.” Now we have not had the slightest trouble with our belts at all, and have never experienced such things as twisting of the belts when driving, or undue oscillation. It is because our belts are longer than those used on a motor cycle that we get better results from them, because, as everybody knows, the short drive employed on a motor cycle is greatly to the disadvantage of the belt, but this extra length, combined with large pulleys on the counter-shaft, removes many of the objections to the useful and reliable employment of belt transmission.

We would respectfully suggest to the judges that their criticism merely represents words and not actual facts, and they have no data before them on which to base such remarks. It is open to anyone to suggest that anything can be “a likely source of trouble,” but the proof of the pudding lies in the eating, and the belt drive as fitted by us gives us no trouble and amply fulfils and justifies its existence.

DUO-CARS, LTD.

[We have received a very similar letter from Mr. L. F. c3 Poyrecane.—Ed.]

#### A “No Tool” Contest.

Sir,—Now that multiple speed gears have rendered even the third-rate motor cycle an infallible hill-climber, and the legal speed limit prevents the engines from being severely tried on the road, some further penalties in the A.C.U. competitions are absolutely essential if the awards of the Union are to have any value in the eyes of the public.

Why not try and wean the motor cycle from the grimy, grease and mud-stained hands of the professional and amateur mechanics, who appear to be the only people who can be relied upon to do a motor cycle credit. A motor car will easily run 10,000 miles without adjustment on the road. Surely it is not too much to ask that the motor cycle shall do one-tenth of this distance without the use of a spanner, after the morning overhaul?

I suggest that the next six days' trial be a “no tool” test. All adjustments could be painted over at the commencement of the test with enamel of a special colour, or sealed where advisable, and a mark or two could be deducted for each nut showing the scratch of a spanner. The tyre test should be developed with a weight or price limit. RIDER.

[Our correspondent is rather severe; we thought the recent 1,000 miles trials more stringent than any car trials we have witnessed.—Ed.]

A well known and popular motor cyclist in Birmingham, Gordon E. Craig, who, in addition to being an enthusiastic motor cyclist, is the manager of the Grand Theatre, Birmingham. The photograph depicts his machine, an 8 h.p. Matchless and sidecar, passing through the Wyeh Cutting, over the Malvern Hills. The occupant of the sidecar is Mr. Craig's mother.

# Streatham and District Annual Hill-climb

## AT TITSEY HILL: PROVISIONAL RESULTS.

One of the competitors at full speed near the start. The photograph gives a good idea of the S bend.

THE Streatham and District Club were favoured with a fine day for their annual open hill-climb. The venue of the climb had been kept secret till the last moment, and most of the competitors first discovered while weighing in at Godstone that the well-known Titsey Hill had been chosen—a hill of considerable length and said to reach a maximum gradient of 1 in 6.

Close to the foot of the hill lies the village church, and it so happened that a wedding was taking place while the climb was in progress. We hope that the service was not disturbed by the roar of the competing machines, and that the cheer which greeted the happy pair as they left the church may be some consolation for any inconvenience that they may have suffered. Results:

### CLASS I. Touring machines not exceeding 350 c.c.

First up was Wilberforce (2½ Douglas), who made a fast ascent. McNab, on a similar machine, was not so fast, his machine was missing slightly and appeared slightly too high geared on top. Newman (Ivy-Precision) made a characteristic climb, his speed as usual being great. Next came Holloway (Premier), who made a fine climb on the smallest machine in the entry. A. G. Daw (S.I.A.M.T.) appeared to be suffering from belt slip and stopped. What appeared to be quite the fastest climb in this class was made by R. G. Mundy on a 2½ Douglas. Results:

A competitor rounding the first bend of Titsey Hill. The curious position of driver and passenger will be noted, the former apparently riding side-saddle.

### Formula.

	Figure of merit
1. Rex Mundy (2½ Douglas) ...	338
2. R. Holloway (2½ Premier) ...	288
3. H. C. Newman (2½ Ivy) ...	241

### Time.

1. Rex Mundy (2½ Douglas).
2. H. C. Newman (2½ Ivy).
3. V. Wilberforce (2½ Douglas).

### CLASS II. Touring machines between 400 c.c. and 500 c.c.

#### Formula.

A. Draper (3½ W.D.) led the way with a good touring ascent, S. R. Axford (3½ Martin) was very fast, and with R. Croucher (3½ Kerry-Abingdon) and Barnes (3½ Zenith) appeared faster than the rest. Tessier (3½ Bat) came up well and quickly, and Crawley (Triumph) showed up well. The 3 h.p. twin Hazlewood, ridden by Begley, was very quiet. Results:

### Formula.

1. S. R. Axford (3½ Martin) ...	428
2. R. Croucher (3½ Kerry-Abingdon) ...	323
3. S. Crawley (3½ Triumph) ...	311

### Time.

1. S. R. Axford (3½ Martin).
2. S. Crawley (3½ Triumph).
3. R. Croucher (3½ Kerry-Abingdon).

### CLASS III. Machines as Class II. Time.

Axford, who had done so well in the previous class, did not come up, and we heard a rumour that he had been disqualified for riding a stripped machine. Croucher (Kerry-Abingdon), Weatherill (3½ Zenith), Tessier (3½ Bat), Clark (3½ Cerah), and Newman (3½ Ivy-Precision) all made fast climbs. Results:

### Time.

1. S. Crawley (3½ Triumph).
2. } R. Croucher (3½ Kerry-Abingdon).
} K. H. Clark (3½ Cerah).

### CLASS IV. Touring machines between 500 and 1,000 c.c.

#### Formula.

The big Zeniths made a fine show, Barnes and Griffith going great guns, while there appeared to be very little difference between the pace of the Hunter brothers, mounted, G. F. on a 7 Zenith, and A. R. on a 5 Zenith. A da Silveira (7 Indian) appeared to be overgeared, a mistake which was common throughout the day. Results:

### Formula.

1. A. R. Hunter (5 Zenith) ...	301
2. S. T. Tessier (4½ Bat) ...	273
3. G. Griffith (8 Zenith) ...	242

Streatham and District Annual Hill-climb.—

S. T. Tessier (3½ h.p. Bat-Jap) travelling well in the 500 c.c. class.

*Time.*

1. S. T. Tessier (4½ Bat).
2. A. R. Hunter (5 Zenith).
3. G. F. Hunter (7 Zenith).

CLASS V. Any machine not exceeding 350 c.c. Time.

In this class Wilberforce and Mundy were the most noticeable. A new machine, the 2¾ Caeco, ridden by H. P. Storey, made its *début* in this class. Unfortunately, it appeared to be suffering from over-lubrication, but, though misfiring badly, it made quite a fast ascent. The engine was a 2¾ overhead valve J.A.P., and was mounted in a racing frame just big enough to surround it. It had no exhaust pipe, and was fitted with a Longuemare carburetter. Its appearance was striking—so was its exhaust. Results:

*Time.*

1. Rex Mundy (2¾ Douglas).
2. H. C. Newman (2½ Ivy).
3. H. P. Storey (2¾ Caeco).

CLASS VI. Any machine up to 500 c.c. Time.

Axford again put in an appearance, and made a very fast climb, as did Tessier, Newman, and Mundy. Soresby (L.M.C.) and P. Hamshar (Eagle) both seemed to be over-gear. E. W. Russel had a strange exhaust pipe fitted to his 3½ Rover; it extended to the rear of the machine, and was brought up under the carrier, being flattened at the end and drilled all over. Results:

*Time.*

1. S. R. Axford (3½ Martin).
2. S. Crawley (3½ Triumph).
3. S. T. Tessier (3½ Bat).

CLASS VII. Any machine up to 1,000 c.c. Time.

Barnes (8 Zenith) made a fine climb and Tessier (4½ Bat) was very fast. Newman, this time on a 3½ Ivy, made a good ascent and then came H. Reed (8 Dot). After his performance last week at the Coventry and Warwickshire climb we expected something sensational. He got away with a roar, but as he passed us we noticed a slight miss, which sounded rather like too little petrol. As he went out of sight he cut out or else his engine faltered, we were unable to determine which, and this continued intermittently to the end of his climb. We missed Holloway's 3½ Premier, which had been smashed up by a cart backing into it. G. F. Hunter started well, but his engine began to misfire badly, and we suspected that the petrol was not turned on, as we saw his hand by the tap, and almost immediately the machine shot away again. A. R. Hunter dropped on to one cylinder before he was half way up, and continued the climb in this condition. Another fine ascent was made by the rider of an 8 Zenith. Results:

*Time.*

1. F. W. Barnes (8 Zenith), fastest time of day.
2. S. T. Tessier (3½ Bat).
3. E. D. Johnson (8 Bat).

CLASS VIII. Sidecar machines, passenger to weigh not less than ten stones. Formula.

Barnes, as usual, tore up the hill. B. Pattison and C. F. Malkin, both on 3½ h.p. Triumphs and sidecar, made fine climbs, the latter being the faster of the two. K. H. Clark (3½ h.p. Corah) had geared his machine too low, with the result that the belt bottomed and slipped, causing him to stop about half-way up. Results:

*Formula and time.*

Figure of merit.

- |                                |     |     |     |     |
|--------------------------------|-----|-----|-----|-----|
| 1. F. W. Barnes (8 Zenith sc.) | ... | ... | ... | 235 |
| 2. G. F. Hunter (7 Zenith sc.) | ... | ... | ... | 212 |
| 3. G. Griffith (8 Zenith sc.)  | ... | ... | ... | 180 |

CLASS IX. Cyclecars. Formula.

There were five entries for this class, and only the Roilo failed to appear. It was difficult to say which was the fastest ascent, but all the machines passed going well. R. F. Messervy carried a mustard tin as a mascot. Results:

*Formula and time.*

Figure of merit.

- |                        |     |     |     |     |
|------------------------|-----|-----|-----|-----|
| 1. J. T. Wood (G.W.K.) | ... | ... | ... | 100 |
| 2. Auto-Carrier (A.C.) | ... | ... | ... | 61  |
| 3. R. Messervy (Duo)   | ... | ... | ... | 50  |

CLASS X. Variably geared touring machines up to 1,000 c.c.

Formula.

Tessier, Mundy, and Griffith made the most noticeable ascents, though the smaller machines performed remarkably well for their size. A long wait and much amusement was caused during this class by a large motor van sticking on the hill. It required much hard pushing by some of the spectators to get it up, and one marshal preceded it with an official red flag. Throughout the day much inconvenience was caused by the traffic on the hill, and it is a pity a more secluded hill could not have been found. However, the hill has so many advantages that they counterbalance this one grave defect. Results:

*Formula.*

Figure of merit.

- |                             |     |     |     |     |
|-----------------------------|-----|-----|-----|-----|
| 1. F. W. Barnes (2½ Zenith) | ... | ... | ... | 174 |
| 2. Rex Mundy (2¾ Douglas)   | ... | ... | ... | 150 |
| 3. S. T. Tessier (3½ Bat)   | ... | ... | ... | 124 |

*Time.*

1. G. Griffith (8 Zenith).
2. S. T. Tessier (3½ Bat).
3. Rex Mundy (2¾ Douglas).

The formula used was that recommended by *The Motor Cycle*,  $\frac{W}{C \times T}$ , except in Class X., where the formula  $\frac{W}{C \times T}$  was tried.

For the purpose of preventing the addition of extra weight with a view to improving the figure of merit on formula, the Streatham and District Club allowed only 140 lbs. to count in Class I., 200 lbs. in Class II., and 250 lbs. in Class IV., no matter what the machines weighed.

F. W. Barnes making a fast ascent on his 3½ h.p. Zenith.

## STREATHAM AND DISTRICT ANNUAL HILL-CLIMB.

(Left) S. R. Axtord (2 1/2 h.p. Douglas), who won Class II, on time and on a mile.

(Right) Rex Moody (2 1/2 h.p. Douglas), who set up a similar performance in Class I.

## Flying Kilometre Speed Trials.

The members of the Sheffield and Hallamshire and Leeds Motor Cycle Clubs held a very interesting speed competition on the 7th inst. in Stapleton Park, the private grounds of Mr. Hope Barton, Pontefract. Electrical timing was used. Results:

Class I. (standard lightweights).—1, J. Haslam, Sheffield (2 1/2 Douglas); 2, Fred K. Langton, Leeds (2 1/2 Hazlewood).

Class III. (standard singles).—1, S. Sawyer (3 1/2 Premier); 2, T. W. B. Durant, Sheffield (3 1/2 Norton).

Class IV. (T.T. singles).—1, Chas. Benn, Leeds (3 1/2 Triumph); 2, T. W. B. Durant, Sheffield (3 1/2 Norton).

Class V. (standard multi-cylinders, unlimited capacity).—1, J. Haslam, Sheffield (6 Zenith); 2, F. W. Roberts, Leeds (6 Zenith).

Class VI. (T.T. multi-cylinders, unlimited capacity).—1, F. R. Roberts, Leeds (6 Zenith); 2, J. Haslam, Sheffield (6 Zenith).

Class VII. (single-cylinder sidecar machines).—1, J. J. Kelly, Sheffield (3 1/2 Bradbury); 2, W. S. Clarke, Sheffield (3 1/2 Rudge).

Class VIII. (twin-cylinder sidecar machines).—1, C. P. Finn, Leeds (6 Enfield); 2, J. Haslam, Sheffield (6 Zenith).

Group of members and friends of the Leeds and Sheffield and Hallamshire M.C.C.'s at the inter-club speed trials in Stapleton Park.

## A West of England Inter-club Match.

The Bristol M.C.C. and the Bath M.C.C. had an inter-club match on Saturday, the 7th inst., over a non stop course of forty-seven miles in the neighbourhood of Bath in which about fifteen hills were observed, all with single figure gradients; more severe than Thursday's route in the Six Days' Trials. The result was a win for the Bath Club, in consequence of which the Bristol team, as losers, had to pay for their own and the winners' dinners.

J. B. Kellar, Bristol, was only one-fifth of a second out on checks, H. Clement completed course on a 4 1/2 to 1 gear, and

C. J. Taylor, weighing 17 stones, on a Scott, completed course non stop.

Bath team.—C. C. Wills (3 1/2 Triumph), H. L. Bush (3 1/2 Scott), C. J. Taylor (3 1/2 Scott), R. T. G. Kelly (3 1/2 Scott), A. G. Hayward (4 Singer), W. H. Grant (3 1/2 Rover three speed), and A. Hopkins (5 Clyno and sc.)

Bristol team.—H. Wasley (2 1/2 Douglas), P. Grout (4 1/2 Quadrant), E. P. Haskins (3 1/2 T.T. Singer), T. P. Davies (3 1/2 Rudge Multi), J. B. Kellar (3 1/2 Triumph), H. Clement (3 1/2 T.T. Singer), and T. Ball (8 Williamson and sc.)

# INTERNATIONAL CUP RACE IN FRANCE.

## SUCCESS OF BRITISH MACHINES.

THE START FROM LE MANS.

W. H. Bashall (2½ h.p. Douglas) and a twin Peugeot rider about to be started.  
W. W. Douglas will be seen on Bashall's left.

Two of the sidecar machines waiting for the word "Partez."

DOWN in the West of France, in the important provincial town of Le Mans, there exists a sporting organisation known as the Automobile Club de la Sarthe et de l'Ouest, which is responsible for the event we are about to report and the Grand Prix de France, which will be dealt with in to-morrow's *Autocar*. The town is *en fête* and its inhabitants are exhibiting symptoms of that delightful form of lunacy which attacks all Frenchmen on such occasions. The examination of the motor cycles took place this morning in the big public square. A few paving stones were pulled up, a space was railed off, and soon the vicinity became a seething mass of happy irresponsible people who took the liveliest interest in the goings on. Racing motor bicycles and racing motor cars careered round, making the town resound with the noise of their exhausts. Later in the day a racing Bedelia, which showed itself capable of the most unearthly din, went three times round the Place

de la République for a trial trip. People rushed madly hither and thither to escape its mad gyrations, but they did not care a straw, and while such behaviour in England would have caused the offender to be run in, here the greatest interest was evoked.

Of the thirty-five starters, eleven ride machines of British origin, three represent America, while the other nationality represented besides France is Germany. The English riders report that the short triangular course is so easy as to be difficult. This seems paradoxical, but as the course is devoid of hills or severe corners the machines will have to be driven hard all the time as at Brooklands. Near the start the surface is rough, but the remainder is excellent.

At an early hour Le Mans was awake, at six o'clock the course was closed, and at a quarter to we left for the Tribune on the gallant little Douglas, which had carried us all the way from Dieppe on the previous day.

Starting the cyclo cars. Two Bedelias and a Cohendet. The latter is the machine on the right.

W. D. South (Rudge) at the replenishing depot at Le Mans. South was second with an average speed of 47½ m.p.h.

### Excellent Organisation.

The stands were opposite the depots, and above the latter towered the great scoring board. At the start the weather was excellent. Several interesting facts are to be recorded. One of the Terrots carried a Continental air bottle containing sufficient compressed air to pump up ten 24 × 2¼ in. tyres and weighing about 2 lbs. English improvements are manifesting themselves slowly on French machines. On the Alcyon and others one noticed handle-bar control and belt rim brakes, but the René Gillet still keeps to automatic inlet valves.

The arrival of the Douglas team created some sensation. W. Douglas arrived with Phillips on the carrier, and W. H. Bashall turned up with his carrier loaded with enormous petrol funnels. His machine was fitted with a large pad or cushion on the top tube against which he could lean. The Terrots were neat looking machines with single cylinder engines. The cylinders are inclined and have horizontal fins. The René Gillet sidecar machine was fitted with a N.S.U. gear. The men were started at half-minute intervals, the only absentees being two Griffon riders, one of whom had been called out to do his military service,

and the other who had had a slight accident during practice, the Wanderer, and two Triumphs.

### The Start.

All the British machines started well. Bashall's and Kickham's Douglases were noisy, but Bailey's was notably quieter. Hardly had the last man left before the Bedelia, driven by Devaux, came past the post. Unfortunately in most cases the numbers were illegible, so the progress of the race was most difficult for a stranger to follow. The men carried numbers on their backs, and often wrapped tubes round them, so that they could not be seen. Both the Ridges and the Douglas were going well and Taylor was going at a good speed. Péan's Peugeot was two minutes faster than Bashall in the first round. Franquebalmé (Terrot) stopped near the depot, restarted, and then came back the wrong way of the course, much to the annoyance of the officials. His trouble lay in his oil pump. Grapperon's New Hudson had evidently punctured, as he slowed up at the depot on his second round and picked up a tube. In his second lap, Diosi (René Gillet) stopped at the depot to clean his carburetter. The Douglas team had an interesting system of signalling. Each man was allotted a certain colour, for example Bashall red and Bailey blue. The exhibition of a flag of, say, red denoted it was time for Bashall to fill up at the next lap. Every man had to do his own filling up and adjustments.

As the course was a very short one, the times of every two laps were posted. Kickham stopped at the end of his fifth lap to fill up, and spent a few minutes adjusting his inlet tappet. Several French riders arrived at the depot at the same time. On his second round, Vanella (R.G.) stopped and spent some time adjusting his back wheel bearing. Bloch (R.G.) arrived with his mudguard loose and his hand brake out of gear.

It is reported that Perrin was riding what was practically a pedal cycle frame, and it is said that it broke. He was slightly hurt. Taylor had been delayed by a broken valve and punctures.

In the passenger class Bourbeau's Bedelia maintained its lead, but Devaux was unable to steer a straight course.

Devay passing through Le Mans. Note the way in which the course is barricaded.

Bailey (Douglas) passing the grand stand. This rider finished third, covering the course in 5h. 19m. 23s.

Pean (twin Peugeot), a consistent performer in French competitions. He was fourth.

FOURTH LAP.			
m. s.		m. s.	
Perrin (Peugeot) ...	55 1	South (Rudge) ...	57 38
Devay (Triumph) ...	56 59	Taylor (Rudge) ...	57 58
Dubose (R.G.) ...	57 30	Péan (Peugeot) ...	59 45
Bailey (Douglas) ...	57 30		
EIGHTH LAP.			
h. m. s.		h. m. s.	
Devay (Triumph) ...	1 48 36	Bailey (Douglas) ...	1 55 41
Dubose (R.G.) ...	1 54 22	Péan (Peugeot) ...	1 56 55
South (Rudge) ...	1 54 51	Bashall (Douglas) ...	1 57 38
TWELFTH LAP.			
Devay (Triumph) ...	2 43 8	Gabriel (Triumph) ...	2 59 30
South (Rudge) ...	2 50 27	Péan (Peugeot) ...	2 52 37
Bashall (Douglas) ...	2 57 15	Dubose (R.G.) ...	2 54 19
SIXTEENTH LAP.			
Devay (Triumph) ...	3 37 45	Taylor (Rudge) ...	3 57 0

Péan (Peugeot) ...	4 51 40	Cuzeau (R.G.) ...	5 4 32

The fastest lap was made by Devay (Triumph) in 12m. 54s., while South (Rudge) made second fastest lap—13m. 29s.

### British Success.

The race resulted in a glorious British victory. The winning machine needs no praise from us. It was an absolutely standard model but minus a front brake, and was splendidly handled by the plucky and skilful Devay. At the grandstand there was nothing much in the way of excitement until near the finish Taylor came by at a terrific rate, and shortly returned the wrong way of the course on the rim, quickly detached the wheel from South's machine, which had just arrived, and dashed off to finish seventh. Bailey broke two tappets, had the carburetter slide jam, and broke a control wire. Bashall broke a valve in the last lap, and another valve broke earlier in the day which jammed in the guide. Scott suffered a broken top tube, but finished ninth. It was a great race, and Great Britain has to congratulate herself on the Triumph, Rudge, and Douglas machines finishing first, second and third.

### Result.

	Machine and rider.	Bore and stroke.	Time.			Average speed Kms. m.p.h.
			H.	M.	S.	
1.	Triumph (Devay) ...	85 x 88	5	6	54	78 = 48½
2.	Rudge (South) ...	85 x 88	5	12	35	77 = 47½
3.	Douglas, 2-cyl. (Bailey) ...	61 x 60	5	19	24	76 = 47
	Peugeot, 2-cyl. (Péan) ...	55 x 70	5	24	43

	René Gillet, 2-cyl. (Bloch) ...	64 x 76	6	24	31	
	Bedelia, 2-cyl. (Bourbeau) ...	80 x 100	6	31	20	
	Bedelia, 2-cyl. (Devaux) ...	80 x 100	6	33	19	

The team prize was awarded to the Rudge team (19 points), with Douglas second (21 points).

The machines were divided into three principal classes, viz., up to 250 c.c., 350 c.c., and 500 c.c., but all ran together for the cup. In the passenger class Bourbeau's Bedelia finished first. Grapperton's New Hudson was the only British machine in this class.

Three out of the four Peugeot machines entered. The four riders were Pean, Baudry, Perrin, and Devaux.

The Douglas team. From left to right the riders are: S. L. Bailey, W. H. Bashall, and E. Kickham.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

Sept. 12th	...	7.22 p.m.
" 14th	...	7.17 "
" 16th	...	7.12 "
" 18th	...	7.8 "

## Well-known Rider Married.

H. H. Bowen was married on Tuesday of last week, and he and his bride are now on their honeymoon.

## Paris Salon.

We understand that Douglas Bros., Bristol, will show their 1913 models at the Paris Salon in December immediately following the Olympia Show. The same firm are also opening a depot in Paris. This is enterprise which we should like to see developed.

## A Recommendation for Sidecar Users.

Riders of sidecar machines who are at all nervous about the front tube not being sufficiently strong, can use, as a makeshift, a strong strap passed under the sidecar tube and attached to some portion of the bicycle. This will prevent the sidecar touching the ground in the event of a fracture of the front connecting bar.

## Real Enthusiasm.

Two lady motor cyclists recently rode from St. Albans to Ravenstonedale, Westmorland, in one day, leaving 6.15 a.m. and arriving 8 p.m. They rode two free-engine  $5\frac{1}{2}$  h.p. Rudges (ladies' models). It rained all the way from Grantham and during one hour, owing to the heavy rain and belt slip, only fifteen miles were accomplished.

## Motor Cycle Accident in America.

We very much regret to report a serious accident which took place on the Vailsburg track, New Jersey, on Monday last, when Eddie Hasha, travelling at a speed of over ninety miles an hour, left the track and dashed into the spectators, turned round, and charged another competitor named John Allbright. Both riders were killed instantaneously, and six spectators were also reported to have been killed and others seriously injured. Eddie Hasha was the well-known Indian exponent who recently accomplished several world's records on the American three-lap tracks. It is reported that something went wrong with the engine which caused the machine to leave the banking. A similar accident occurred in France some years ago at the Park des Princes track, where the banking is not so acute as it is on the American three-lap tracks. Eddie Hasha was married, and report says that his wife witnessed the accident. He was quite a young fellow, and we offer our sincere sympathies to his widow. Doubtless American sportsmen will see that she is well provided for.

The late Eddie Hasha.

## Incitement to Crime.

At a recent meeting the Willenhall councillors discussed the speed of motorists, and Councillor Tyler suggested that a bonus of 5s. should be offered to every

police officer who obtained a conviction. The clerk regarded it as a good suggestion, and the council purpose considering the matter. If this suggestion is really carried out it ought to be carried out to its logical conclusion, and we think that a fair *pro rata* bonus would be £10 in the case of a burglary and £100 for the conviction of a murderer. Also many people regard the cattle maiming outrages which have been too common in South Staffordshire of late as a more serious crime than exceeding the legal limit, and more worthy of police activity. We regard this suggestion as most immoral and a direct incitement to perjury and trumped up charges on the part of the police, which have, unfortunately, not been altogether unheard of hitherto in several parts of the country. We have previously had occasion to note that, where great activity is indulged in by the police in the highways and hedges—and anyone knows where the constables will be found—other crimes, such as burglary and assaults on children have become much more prevalent.

Devay (Triumph), winner of the French International Cup race. He rode a standard machine in all details, and his win was most popular among the British riders and spectators. Note the scoring board above the grand stand.

**Motor Cycle Firm's Profits.**

We are pleased to be in a position to chronicle the fact that the Premier Cycle Co., Ltd., of Coventry, one of the oldest concerns in the cycle and motor cycle industry, has just issued its directors' report which was submitted to the shareholders last Monday at the annual general meeting. The net balance of profit is £27,072 1s. 1d., and a dividend at the rate of 7½% on the preference shares is being paid £9,375. 15% on the ordinary shares £7,500, £10,000 is being carried to the Reserve Fund, and £9,407 to next year's account. We congratulate the directors of the Premier Cycle Co. on such a prosperous year.

**A.A. and M.U. Enterprise.**

The A.A. and M.U. have recently inaugurated a campaign by which members will be able to obtain the use of clean hand towels, brush and comb, etc. These articles are enclosed in a special cabinet under lock and key, and members who desire it are provided with keys which will enable them to unlock the cabinet and obtain access to the articles. We cannot see the use of this latest form of enterprise, because clean towels are to be found in all decent hotels, and therefore it follows that hotels without clean towels are unfit for A.A. patronage. On the whole we think motorists would more appreciate duster boxes containing choice selections of silk waste and Selvyt cloths. Or, stay, is this latest form of enterprise due to complaints from hotel keepers?

**British Imports and Exports of Motor Cycles.**

From the following tables the imports and exports of motor cycles for the month and eight months ended August 31st for the last three years may be seen at a glance:

IMPORTS			
Month ended August 31st.			
	1910.	1911.	1912.
	£	£	£
Motor cycles ...	4,298	2,597	3,741
Parts thereof ...	6,013	4,875	10,827
Total ...	10,411	7,472	14,568
Eight months ended August 31st.			
Motor cycles ...	35,462	34,096	33,426
Parts thereof ...	38,979	45,555	81,563
Total ...	74,441	79,651	114,989
EXPORTS.			
Month ended August 31st.			
	1910.	1911.	1912.
	£	£	£
Motor cycles ...	11,317	19,497	56,857
Parts thereof ...	4,766	5,990	18,738
Total ...	16,083	25,487	75,645
Eight months ended August 31st.			
Motor cycles ...	64,978	139,786	295,316
Parts thereof ...	26,130	41,632	106,026
Total ...	91,108	181,418	401,342

As will be seen, the amount of exports for the month ended August 31st, 1912, is over four times the amount of the same period of 1910, while for the eight months ended August 31st, 1912, is also four times that of the same time in 1910. It will also be noticed that the imports of motor cycles are gradually decreasing, while the amount of imports of motor cycle parts is on a steady incline.

**Mr. Olssen's Recovery.**

We were glad to see Mr. V. Olssen again at the Streatham and District climb. He still has to walk with two sticks after his accident in the M.C.C. London-Land's-End run, but is progressing favourably, and can drive his car again.

**The French Six Days' Trial.**

The most important motor cycle trial yet held in France will be the Six Days' Reliability Test for motor cycles and three-wheelers, organised by the A.C.F. The following information has been published by the Competitions Committee. The machines will be started each day in order of entry. Each stage will be divided into sections of from forty to fifty kilometres. At the end of each there will be controls. The minimum speed imposed will be thirty kilometres an hour for every class, which means that machines may travel at a greater speed, and no marks will be deducted for early arrivals, but no competitor may sign the sheet before the time at which he is due. English manufacturers will do well to consider entering for this trial, which is held under the auspices of the principal

motoring organisation in France. It has been pointed out to us by foreign riders of English machines that they are of the opinion that were the reliability and excellence of British motor cycles properly set before the Continental public the latter would appreciate their value and learn that they are worth the extra price.

**Club Secretary in Trouble.**

John King, reported to be the secretary of the Nottingham M.C.C., was bound over in £10 for three months at the Alford (Lincs.) Police Court on Monday of last week. Defendant, who pleaded guilty, was charged with being drunk in the street on the Saturday night following the motor speed trials. The Police Sergeant, in giving evidence, said that some of the men engaged in these trials behaved in a most disgraceful manner. They broke glasses and tables at the Louth Hotel and windows at the Book-in-Hand Hotel, and the defendant was the ring-leader. He was warned four times during the night, so the witness said, and he refused to go to his lodgings. Defendant said he was secretary of the club and he had paid for the damage done at the Louth Hotel and told the proprietor he would be responsible, and also that he could not keep the members under control. We imagine, in effect, the advice to the other roysterers was "Don't do what I do but do what I tell you," attributed to a certain sporting parson. We hardly think that a secretary against whom is alleged such conduct is likely to be able to keep his own members, or the members of any other club, under control, and we hope the action of the Mablethorpe police will prevent further disgraceful scenes of this kind, which have already done the pastime a considerable amount of harm, and if continued cannot fail to cause motor cyclists to be given the cold shoulder. We have evidence to prove that motor cyclists have been requested to use special rooms at an A.C.U. appointed hotel.

R. M. Davy (3½ h.p. Calthorpe) making good time at the joint speed trials promoted by the Leeds M.C.C. and the Sheffield and Hallamshire M.C.C.

## Some Experiences with a 1912 B.S.A.

**I**TS first journey was a fairly long one—from London to Taunton—where it found itself at once *in medias res*, as its particular work was to carry me to those points of vantage in hilly Somerset and Devon from which the Six Days' Trial could best be seen. The trip to Taunton was made in weather which more closely resembled April than August. A slimy film of mud covered the wood paving all the way to Hammersmith, Castelnau was little better, and Richmond with its tramlines worse than anything. However, it was soon over, and when at Sunbury Admiral Arbuthnot stopped to raise his gear, he congratulated the writer on being a good pilot. He knew the North Sea well enough, but he was blessed if he could have got out of town on to the Exeter Road as quickly or as comfortably. Staines was then passed, and here the main highway was reached, which brought us without incident to Basingstoke. After Basingstoke the deluge. How it poured! But sunshine followed the rain at Andover, and good time was made over the fine open road past Stonehenge, opposite the military aeropolis on Salisbury Plain—a wonderful contrast between our greatest antiquity and our newest form of locomotion. More heavy showers followed, but easy to control in traffic, steady in grease, and minding the elements not at all, the B.S.A. brought me without a hitch to Warminster.

Naught troubled me in the way of hills as none existed—at least, if they did the machine noticed them not. My first trip on the Six Days was to Blagdon and then to Telegraph hills, both of which were surmounted with ease, the low gear only being engaged for a moment or two. These were but ordinary incidents in a day's run, as the next interesting stage of my journey was from Ashburton to Two Bridges, which enjoys the reputation of being the hilliest road in England. It poured and poured with rain, the roads were stony, rutty, and steep, and the wind

blew strongly; yet, save once to ask the way, I never left the saddle. The road is No. 746 in the Contour Road Book. Mostly "1 in 7 or 1 in 8," says Gall and Inglis, not desirous of discouraging the enthusiastic pedal cyclist, for whom the work was originally written—"all highly dangerous." Next day I did a choice bit of cross-country work from Barnstaple to Blackmoor Gate without an involuntary stop. Paracombe did not trouble the B.S.A. in the slightest, but Beggar's Roost called for a stop. I am confident, however, the machine was equal to it, as I was geared  $4\frac{1}{4}$  to 1 on top, and had I not been too lazy to open out the adjustable pulley I should have got up, as the engine had ample power, which it maintained the whole time it was in my possession.

The machine gave the greatest satisfaction, was comfortable, steered well, and ran with clocklike regularity. Only one mechanical trouble did I suffer, and that was at Crewkerne on the ill-omened Friday, when I lost my overalls, my best screwdriver, someone took a fancy to the horn, and the inlet valve broke at the slot. Fortunately the garage people rose to the occasion, and sent eight miles into Yeovil and brought back another. The only criticisms I can give are, firstly, that the exhaust tappet threw out a fair amount of oil, and, secondly, that the foot brake might have been much more powerful. The front brake, however, was distinctly good, and the C.A.P. carburetter, shortly to be renamed the B.S.A. and already standard, a joy for ever. The improved gear control by one pedal only was excellent. The release pedal to engage from low or neutral to top, however carelessly depressed, made the change so sweetly, thanks to the cone clutch, that no shock of any kind whatsoever was apparent. The starting of the engine by pedal was always effected at the first turn if the engine were warm or if the engine were cold and petrol were injected it started just as readily.

E.M.P.B.

## The Passes of the Pyrenees.

A Mototri-Contal on the summit of the Col d'Aspin, 4,912 feet above sea level.

"The Passes of the Pyrenees." C. L. Freeston, F.R.G.S., Kegan Paul, Trench, Trübner and Co., Ltd. Mr. Freeston's name first came before our readers in our review of his book "The High Roads of the Alps." After the Alps one naturally turns to the Pyrenees—a district possessing a beauty of its own, quite different from that found in the Haute Savoie and the great range stretching far east into Southern Europe. Owing to the southern position the mountains in this lovely region are clothed in verdure almost to their summit, and little or no bare rock projects above the leafy covering. The roads are good, and mostly well graded, but in places the gradient attains a maximum of 1 in 6, which is much steeper than is usually encountered in France. The book itself is replete with valuable information. Every yard dealt with has been covered by the author, who gives notes on surface, gradients, and altitudes which have hitherto been unobtainable. The work is well written and beautifully illustrated, and is strongly to be recommended to all who desire to tour in this attractive region, which is best visited in late summer or early autumn.

# The C. & H. Cyclecar.

- (1) Side view of the C. & H. cyclecar, showing chain transmission.
- (2) Disposition of driving wheel and method of attachment.

We had the privilege of seeing the other day the "C. and H." cyclecar, which has been placed on the market by Messrs. Corfield and Hurle, 52, Widders Road, Stamford Hill, N. It is driven by a 5-6 h.p. water-cooled twin-cylinder Fafnir engine, 70 x 80 mm.

The engine is fitted with mechanically-operated valves, and there are compression taps in each cylinder. The magneto is carried in front of the crank case, and is gear driven. On the engine-shaft is a multiple-disc clutch.

From the engine to the Chater-Lea three-speed gear box, which is suspended by two inner longitudinal members, the transmission is by chain. On the counter-shaft is carried an external contracting band brake, operated by a pedal, and from the counter-shaft to the rear wheel the transmission is again by chain. The side brake is of the external type, and is carried on the rear wheel spindle.

The back wheel is carried in a separate frame, hinged at the rear on two stays

The 5 h.p. twin Fafnir engine fitted to the C. & H. cyclecar, described on this page.

attached to the inner longitudinal members of the main frame, thus allowing the wheel to have a perfectly parallel up and down movement. Interposed between the main frame and the hinged frame are semi-elliptical springs with shackles at each end, while the front portion of the vehicle is also suspended on semi-elliptical springs with shackles at the rear ends.

Over the rear wheel there is a detachable cover and mudguard, secured by means of two winged nuts. Its removal, which is very easy, discloses the whole of the back tyre. Wheel steering is employed, and a 3½ gallon petrol tank and the oil tank are carried on the dashboard.

We were taken for a short run in the traffic, and found it to be easily controllable, lively, and fairly well sprung. It showed itself to be capable of accelerating on top speed to about 25 m.p.h. on a 1 in 20 grade, with two passengers, despite several checks.

South  
Birmingham  
M.C.C. Novices'  
Hill-climb. A.  
Woodgate (2½  
Singer) leading  
A. Spiers (2½  
Douglas) in the  
final of the light-  
weight class.

**Westmorland M.C.C.**

The result of a petrol consumption trial held last week is as follows: 1, J. Braithwaite (3½ Braithwaite), 338 m.p.g.; 2, L. Pierce (3½ Corah), 320 m.p.g.; 3, B. Jeffrey (6 Bat). Result of a fast and slow hill-climb held on Saturday last at Hutton Park. 1, R. K. Chapton (2½ Humber); 2, L. S. Parder (3½ Scott); 3, I. H. Nelson (3½ Scott).

**Mersey M.C.C.**

Additional and amended awards are as follows: Special prizes—Lightweight class, W. Davies. (2½ Victoria-Jap), 500 c.c., V. Horsman (3½ Singer) sidcar, H. G. Dixon (3½ New Hudson). Gold medals.—F. Rees (3½ Rudge), H. W. Coopland (7 Williamson sc.), L. Mogridge (3½ Mead Precision), and A. J. Jenkins (2½ Douglas). Silver medals.—G. D. Ninon (3½ Rudge), C. Hobbs (3½ Humber), and W. H. Longton (3½ Ivy-Precision).

**Birmingham M.C.C.**

An open twenty-four hours' reliability trial, Birmingham to Carlisle and back, will be held on the 21st inst., starting at 10 p.m. on the 20th. Route: Birmingham, Brownhills, Newport, Whitechurch, Warrington, Preston, Kendal, and Carlisle, and back through the same places in reverse order. The distance is approximately 200 miles each way, and there will be non-stop sections from Kendal to Carlisle on the outward journey, and from Carlisle to Kendal on the return. Full particulars, together with entry forms, are now ready and may be obtained on application to Mr. S. C. Perryman, trials hon. secretary, 67, Wood End Lane, Erdington, Birmingham.

**Western District M.C. (London).**

The reliability trial for the Williams Shield to Tetsworth and back from Uxbridge was successfully run off on Saturday, the 7th. The results, subject to confirmation, are: 1, E. S. Nitter (2½ Douglas), 4s. slow, non-stop; 2, F. W. Ritchie (8 Matchless), 10s. slow, non-stop; 3, M. G. Tweedie (3½ N.S.U.), 20s. slow, non-stop; W. F. Ritchie (3½ Bradbury), 55s. slow, non-stop; Dr. Merrick (3½ Triumph), 10s. fast, pedalled on Dashwood Hill.

The run to Bookham on 8th inst. was well patronised, and members as usual picnicked on the common.

**Lincolnshire A.C. (Motor Cycle Section).**

A knock-out hill-climb was held on the 7th inst. at Scamblesby. Results:

Class II. (up to 600 c.c.).—1, J. H. Brookes (3½ h.p. Rudge); 2, W. J. S. Bament (3½ h.p. Rudge).

Class III. (over 600 c.c.).—1, B. Rhodes (6 h.p. Zenith); 2, A. W. Grocock (6 h.p. Zenith).

Unfortunately, traffic caused considerable delay in running off the events. The surface of the hill was in good condition and the weather fortunately fine. Several good finishes entertained the crowd of spectators on the brow of the hill.

**Armagh and District M.C.C.**

Hill-climbing competitions, under the auspices of the above club took place on Friday last. There were three events, the results of which were as follows:

**LOCAL EVENT.**

	Actual time.	H'cap time.
J. A. Peel (2½ Douglas, 10s. start)	32½s.	22½s.
C. Walsh (2½ Singer, 12s.)	35½s.	23½s.
T. G. Anderson (3½ B.S.A., 3s.)	27s.	24s.

**OPEN HILL-CLIMB.**

G. Pinion, Belfast (3½ Matchless, 3s.)	26s.	23s.
J. Stewart, Belfast (2½ Douglas, 10s.)	33½s.	25½s.
F. J. Walker, Dublin (3½ Rudge, 3s.)	27½s.	24½s.

**OBSTACLE RACE.**

T. G. Anderson (3½ B.S.A., 3s.)	46½s.	43½s.
C. Walsh (2½ Singer, 12s.)	56½s.	46½s.
R. Whitsett (3½ Singer, 4s.)	49½s.	45½s.

**Manchester M.C.**

An open hill-climb will take place on October 5th. There will be five classes: Lightweights, Standard Touring Machines, Racers, Unlimited, and Passenger.

**Herts County A. and Ae.C. (Motor Cycle Section).**

The third open quarterly trial will be held shortly over a sporting course of 100 miles. There will be a paperchase and conking exhibition on the 14th inst. A start will be made at 3 p.m. from a point about half a mile north of Redbourn, Herts, and a trail will be laid by hares (with ten minutes start) over an interesting course. The route, although severe, will not be impossible, and members are requested to ride with judgment.

**South Birmingham M.C.C.**

A hill-climb was held on the 7th inst. at Hill Cop on the knock-out principle. Results:

Class I., Lightweights to 350 c.c.—1, A. G. Woodgate (2½ h.p. Singer); 2, A. Spiers (2½ h.p. Douglas).

Class II., Single-cylinder Touring Machines.—1, L. A. Bees (3½ L.M.C.); 2, S. A. Rowlandson (3½ h.p. Rudge).

Class III., T.T. Machines to 520 c.c.—1, A. R. Felton (3½ h.p. J.A.P.); 2, J. Percock (3½ h.p. Alldays).

**Cardiff M.C.**

Beautiful weather prevailed in South Wales on Saturday last, when a sporting event, in the nature of a hill-climb, was held just outside Usk, on the knock-out principle. Results:

**CLASS I. For machines of any power.**

First Heat: 1, H. Wessendorf (3½ Premier), 3s. start; 2, L. Sawyer (3½ Triumph), 5s.

Second Heat: 1, W. L. Davies (3½ James); 6s.; 2, A. B. Shirley (7 Indian), scratch.

Third Heat: 1, E. Chapman (6 Zenith), 3s.; 2, J. Mathias (2½ Humber), 5s.

Fourth Heat: 1, J. Clarke (3½ Rudge), 3s.; 2, W. D. Giles (2½ Precision), 10s.

**Second Round.**

First Heat: E. Chapman (6 Zenith); 2, H. Wessendorf (3½ Premier).

Second Heat: 1, W. L. Davies (3½ James); 2, J. Clarke (3½ Rudge).

Final: 1, W. L. Davies (3½ James); 2, E. Chapman (6 Zenith).

**CLASS III. For motor cycles with sidcars.**

Final: 1, E. Chapman (6 Zenith); 2, W. H. Smith (8 Jap).

**CLASS IV. For machines built before 1909.**

Final: 1, C. W. Cox (3½ Rex); 2, D. W. Jones (3½ Triumph).

Start of the final in Class I. at the Cardiff M.C. hill-climb. The machines are a 6 h.p. Zenith (on left of photograph) and a 3½ h.p. James.

Telegrams—"Douglas, Kingswood."

London—336, Goswell Road, E.C.

Club News.—

**Oxford M.C.C.**

The committee regret that the open reliability trial arranged to take place on September 14th has been abandoned.

There will be a social run to Bournemouth for the week-end on September 21st, starting at 1 p.m., from Magdalen Bridge, Oxford, returning early on the Monday morning.

**Manchester Amateur M.C.C.**

A hill-climb will be held on Axe Edge, near Puxton, Derbyshire, on the 22nd inst., at 2.30 p.m. The climb will be a flexibility test, each competitor to make a fast and slow climb. There will be two classes—(1) singles and (2) twins.

Formula F  
S

**Torbay and District M.C.C.**

For the open hill-climb on September 14th, the formula known as the A.C.U. will be used. Another class has been added for touring machines from 500 c.c. to 1,000 c.c., and in the touring classes any handle-bars may be used provided the ends do not extend below the top tube of frame. This rule has become necessary owing to the difficulty in deciding what is a touring machine.

**Aberdeen and District M.C.C.**

A hill-climb was held at Potarch on the 31st ult. There are two tricky turns and much depends on skilful driving. Results:

	Fig. of merit.
1. G. Cummings (3½ T.T. Matchless) ...	77
2. A. Stewart (3½ I.T. Rudge) ...	76
3. J. A. Wood (3½ Rudge) ...	69
4. J. Coulter (3½ T.T. Triumph) ...	68
5. H. Frazer (3½ Rudge) ...	59

G. Cumming won the Challenge Cup presented by Mr. T. W. Smith for fastest time.

**Furness M.C.C.**

A hill-climbing competition was held at Healinghearth Hill, Rusland Valley, on the 1st September. There were four classes, the results being as follows:

Class I. (Lightweights under 450 c.c.)—1, J. Timmins (2½ Royal Enfield); 2, M. Bradbury (2½ Douglas); 3, H. Blamire (2½ Douglas).

Class II. (Single-cylinder machines up to 500 c.c.)—1, G. W. Braithwaite (3½ Zenith); 2, H. Bloxam (3½ Triumph); 3, P. Bryant (3½ Triumph).

Class III. (Any machine over 500 c.c.)—1, G. Bigland (6 Zenith); 2, E. E. Cloed (6 Zenith); 3, W. Irving (4½ Precision).

Class IV. (Machines with sc. any capacity.)—1, E. E. Clow (6 Zenith and sc.); 2, G. W. Braithwaite (3½ Rudge and sc.); 3, E. A. Wilson (3½ New Hudson and sc.)

Competitors were timed by telephone, and results were declared on formula  $\frac{W}{C \times T^2}$  as recommended by *The Motor Cycle*.

**Hamilton and District M.C.C.**

On the 21st ult. the members held their petrol consumption test under ideal weather conditions. Results: 1, Dr. Fotheringham (3½ Bradbury); 2, H. Street (3½ T.T. Triumph); 3, T. Gibson (8 Dot).

A highly successful flexibility hill-climb was run off, on the 31st ult., at Kirkmichael Kirk Hill, near Lanark. Some very good performances were made. Results: 1, R. Mack (4½ Calthorpe); 2, R. Cassells (8 Matchless); 3, H. Street (3½ T.T. Triumph).

**Leicester and District M.C.C.**

A hill-climbing competition was held on the 29th ult. The course was a hill of medium gradient, and the distance travelled was a mile. The top portion of the hill was in very bad condition, having a large quantity of loose stones upon the surface. Notwithstanding this, some very good performances were made.

The Judge Cup, presented for the best performance of the day, determined upon the formula  $\frac{C \times T^2}{W}$ , as recommended by *The Motor Cycle*, has been decided in favour of Woodgate (Douglas), whose performance was excellent.

The electrical timing apparatus again proved a great success, and practically no comment was made by anyone concerning the timing. Results:

**CLASS A (1).**

	Formula.	Time.
1. J. H. Woodgate (twin Douglas) ...	7,712	1m. 22½s.
2. H. Petty (lightweight Singer, single) ...	8,300	1m. 40½s.

**CLASS A (2).**

	Formula.	Time.
1. M. Simpson (Rudge, single gear) ...	8,652	1m. 21s.
2. A. L. Barker (3½ Singer, with speed gear) ...	9,252	1m. 27s.
3. F. Snowden (Rudge-multi-speed) ...	9,500	1m. 28½s.

**CLASS A (3).**

	Formula.	Time.
1. S. Briggs (6 twin Zenith-Jap) ...	11,150	1m. 14s.
2. W. M. Matthews (6 twin Zenith-Jap) ...	14,250	1m. 22s.

**CLASS A (4).**

	Formula.	Time.
1. S. Briggs (6 twin Zenith-Jap) ...	14,000	1m. 47½s.
2. F. Snowden (Rudge-multi-speed) ...	14,925	2m. 31½s.
3. W. M. Matthews (6 twin Zenith-Jap) ...	16,625	1m. 55½s.

**CLASS A (5).**

	Formula.	Time.
1. E. W. Leonard (T.T. 3½ B.S.A.) ...	9,225	1m. 24½s.
2. A. L. Barker (3½ Singer, speed gear) ...	9,250	1m. 27½s.
3. E. Folwell (3½ T.T. B.S.A.) ...	9,650	1m. 24s.

**CLASS A (6).**

	Formula.	Time.
1. F. Snowden (Rudge-multi-speed) ...	9,500	1m. 28½s.
2. E. W. Leonard (T.T. 3½ B.S.A.) ...	10,775	1m. 31s.

**CLASS B (1).**

	Formula.	Time.
1. W. P. A. Chapman (6 twin Champion-Jap) ...	...	1m. 18½s.
2. H. Petty (3½ Singer) ...	...	1m. 19s.
3. W. M. Matthews (6 twin Zenith-Jap) ...	...	1m. 22½s.

A busy scene. Weighing in at the Coventry and Warwickshire M.C. open hill-climb held at Woodway Hill, Dodford, near Daventry.

### A Valve Cooling Device.

To prevent excessive heating of the exhaust valve A, a disc B and rod C of copper, or other metal of high conductivity (of heat), is arranged as shown. The rod C is provided with a series of radiating plates D. The action is to provide a cool zone close to the exhaust valve, reducing the amount of heat imparted to the latter.—E. B. Ludlow, No. 24,061.

### Poppet Valves.

The invention is shown applied to an overhead inlet valve of the type used on the Rudge machines. The valve A itself is of ordinary construction, but the washer B is formed with a conical recess into which the cotter C fits. The spring D extends around the conical portion and up to the flange illustrated, enabling a long spring to be employed. Further, the cotter is subjected only to a compressive stress.—F. Pountney and Rudge-Whitworth, Ltd., No. 22,399, 1911.

### A Neat Sidecar Accessory.

A call on Thomas Mackenzie and Co., Bath Passage, Birmingham, is always interesting, and last week we were privileged to see the first of several novelties in the sidecar line. One of the neatest fittings we have seen is the firm's Cuverall, which is made of waterproof material, and can be used either to cover over a sidecar, when not in use, or to protect the passenger, leaving only the head exposed, or as an ordinary sidecar

### A Two-speed Free-engine Hub.

Upon the fixed spindle A is mounted an internally toothed ring B, which forms part of an epicyclic train, and carries the belt pulley at C and pedalling sprocket at D. The planet pinions E of the epicyclic train rotate upon spindles F carried

by a ring secured to the hub shell at G. The sun pinion H is carried by a sleeve J mounted on the fixed spindle.

This sleeve J has slidably mounted upon it a clutch member K adapted to engage either a clutch member L carried by the hub shell, or a clutch member M anchored by an arm N to the frame. The sliding clutch member K is controlled by a cross pin O, and is normally impelled into contact with the clutch member L on the hub shell by springs P. When in this position the epicyclic train is locked solid and a direct drive is provided. To obtain the lower gear the clutch member K is pushed out of engagement with the clutch member L, and into engagement with that M anchored to the frame, holding the sun pinion H stationary, and transmitting the motion to the planet pinions and hub shell at a reduced speed. When the clutch member K is intermediate of the cones L and M a free engine is provided, and while in this position the engine can be started up by pedalling, the sprocket D being carried by the engine pulley C for this purpose.—Birmingham Small Arms Co., Ltd., and H. M. Phillips, No. 21,082, 1911.

### Saddle Springing.

The seat A is supported at each side of the rear on compression springs B and tension springs C, arranged in alignment, so that when the saddle is under load a direct thrust is applied to the springs, and there is no tendency to lateral bending.—A. E. Wilby, No. 21,835, 1911.

apron. It may be fastened in any of these positions by neat metal fastenings, and presents a workmanlike appearance.

### Belts in the Coventry Hill-climb.

A remarkable success by the Lycett's "Rawido" Belt Co., Ltd., Birmingham, was attained at the Coventry and Warwickshire Motor Club hill-climb on the 31st ult., when every winner of the open events on time and formula used the new Lyso belts. W. Stanhope Spencer also used one of these belts on a Rudge and sidecar when he broke the sidecar records on the 30th ult.

### Waterproof Magnetos.

Correspondence has recently appeared in these pages respecting the waterproof qualities of motor cycle magneto machines. The judges' report on the behaviour of the magnetos in the Scottish Trials was that they were not so waterproof as they might have been. Several riders in these trials suffered from wet getting into the magneto machine and shorting the current. J. J. Oulsnam, a motor cycle agent, of Wirksworth, in a letter to the Bosch Magneto Co., says that during the recent floods he rode a motor cycle fitted with a ZE1 magneto for a mile through water, six to twelve inches deep, on the low gear without a misfire, and at one place where the road is below the level of the River Trent he had to push the machine through the water which came over the top of the engine and magneto, the crank case being filled with water as well as the combustion chamber. After this experience he says that he had not to touch the magneto, and after cleaning out the engine it started without the slightest hesitation.

Two novel machines at the Ashburton control in the Mersey M.C. reliability trial. The machine on the left will be recognised as the sprag-frame 3½ h.p. Charles-Edmund-Jap, which was seen at the Olympia Show of 1910. The right hand machine is a 2½ h.p. open-frame Victoria-Jap (S.A. three-speed)—the smallest machine in the trial.

# WHITELEY'S

## WEATHERPROOF CLOTHING FOR THE MOTOR CYCLIST

The Popular "Aqua Repela" Motor Cycling Suit—  
Guaranteed Weatherproof. Made from Rubberless material,  
with all seams treble sewn. The Overalls are gusseted and  
fitted with patent instep fastening. A splendid outfit for  
hard wear

This Suit can also be had with Overalls in Trouser style,  
fastened with belt at waist

Loose slip-on Coat from the same material, most suitable  
for rough wear

# "RONI"

THE  
FAMOUS

## BRAY "RONI"

ACETYLENE BURNER  
For HEADLIGHTS.

Gives, from a single gasway only, an  
atmospheric flat flame which cannot become  
distorted and crack lens or mirror.

The Burner is of the air-injecting type—it will  
not carbonise.

It is now fitted with a Pressure Check, which  
obviates flaring.

Send for descriptive booklet of the Roni Burner to

# MAUDE'S BARGAINS

**ARE YOU** buying a Motor Cycle? If so, you are looking, doubtless, for what you consider the best market for your requirements.

**YOU ARE** wanting the best possible article at the lowest possible price. You want something to give entire satisfaction.

**IT IS,** therefore, better to deal with a firm who have a reputation to keep. Other firms, doubtless, tell you that they are "THE FIRM," etc., etc., and insinuate others as being of a doubtful character. We do not do this, as we believe that fair trading will supply the proof sooner or later.

**IS IT** necessary to tell you how straight dealing we are, or the like? Why not ask your motor cycling friends for the proof? Perhaps you have not got our lists, in which case we would like to send you our 1912 list of

## THE PORTLAND SIDECAR

It would prove very interesting, and we feel confident that if you are a sidecar buyer you cannot afford to neglect our claims. It is post free for the asking.

**MOREOVER,** we have a few Motor Cycles to offer at a great reduction.

**WE ARE GIVING** large discounts on our standard catalogue prices for Second-hands for cash customers. These discounts also apply in the case of a few shop-soiled

**1912 MODELS,** so that really you cannot afford to neglect our claims to being reasonable in all respects.

**DEFERRED PAYMENTS** in all cases at makers' catalogue prices for 1912 models, no objectionable enquiries being instituted, and matters carried through without delay.

**DO YOU THINK** you can better our terms? If so, why not try for yourself? No catch-penny advertisement, but genuine talk in the interests of ourselves and our clients.

**Maudes' Motor Mart,**  
136, Great Portland Street,  
LONDON, ——— W.

- 31hp. Motor Cycle, mag., Palmer eard tyres, running order, good machine; £12.—Please write, with Clascen, 12, Ulysses Rd., Hampstead, N.W. [509]
- 41hp. Quadrant, good condition, spring forks, new tyres, and spares; genuine bargain, £14, or near offer.—Woolgar, 11, Velindre Rd., Barnes. [517]
- PREMIER, 24hp., Armstrong, 3 months old, done 700 miles, perfect condition, all accessories; £50, sacrifice 40 gns.—W. H. Carver, Uppminster. [520]
- DOUGLAS, 1911, not run 300 miles, excellent condition, £29; Brown, 31hp., mag., B.B., £20; buying cyclear.—Jones, Victoria Rd., Woodbridge. [X347]
- PHELON and Moore, Ltd., 4, Percy St., W., have several 2nd-hand P. and M.'s for sale; particular on application, or can be seen at above address. [X677]
- 11hp. Clement Lightweight, 2-speed gear, nearly new 12 Clincher, perfect condition and running order £26/10, lowest.—Seen, 129, High St., Croydon. [X354]
- TRIUMPH, Oct., 1911, clutch model, in good condition, been well looked after, complete with many spares; £40.—Greswell, Aerodrome, Hendon. [X360]
- EAGLES.—N.S.U., 31hp., popular model, new as June as new mag., 1911 spring forks, adjustable pulley, new Dunlop belt, Palmer cord tyre; £24/10.
- EAGLES.—N.S.U. 3 h.p. Twin, latest pattern model spring frame, Bosch, m.o. valves, 2 speeds, free engine, nearly new; £34.
- EAGLES.—Motosacoche, 1910, Bosch, free engine, Druid forks, Whittle belt; £16.
- EAGLES.—N.S.U. 4hp. Twin, 1910, Bosch, m.o. valves, N.S.U. 2-speed gear and free engine, nearly new; £28.
- EAGLES.—New Hudson, 24hp., 1911, J.A.P. engine, Armstrong-Triplex 3-speed gear and free engine latest improvements; £33/10.
- EAGLES.—Bradbury, 1912, belt, 2 speeds and free engine model, new, slightly soiled; £50.
- EAGLES.—Excelsior, Chater-Lea, 31hp., low built vertical engine, h.b.c., adjustable pulley; £9/10.
- EAGLES.—Immediate delivery from stock of the famous N.S.U. 2-speed gears with free engine from £5/15, for Triumph £6/15, for Bradbury £7; trade supplied.
- EAGLES.—We have a few brand new 31hp. 1911 N.S.U. 65x88 Model de Luxe, just delivered, in machines for sidcar work, Bosch mag., 1912 spira forks and other improvements, finished in latest style complete with stand, carrier, tool case, full set of tools; £37; N.S.U. 2-speed gear £5/15 extra; Millford Herald sidcar with No. 1 torpedo body, £7/15 extra; deferred payments, exchanges entertained.
- EAGLES and Co., High St., Acton.—N.S.U. We London District Agency. Liberal allowances for machines in part payment.—Tel.: 556 Chiswick. [X370]
- INDIAN, 4hp., free engine, late 1911, splendid condition, carefully used; £37/10, or nearest.—Re mayne, Glendale, 41, Natal Rd., Bowes Park, N. [514]
- DOUGLAS, 24hp., 1911 standard, excellent condition, new P. and H. lamp and generator, horn mirror; £27, nearest offer.—44, Olive Rd., Cricklewood. [502]
- 1912 Premier, 31hp., Armstrong 3-speed, free engine P. and H. lamp, horn, and cyclometer, new May bargain, £48.—Star Garage, Amelia St., Walworth. [505]
- ANTOINE, 3hp., splendid condition, new Palm cord tyres, engine just overhauled, footboards cheap.—173, Malden Rd., Hampstead. After 7 p.m. [505]
- ZENITH-GRADUA, 31hp., 1912 model, only ride 150 miles, condition as new; owner bought low n.p.; £48, or near offer.—69, Drayton Gardens, S.W. [506]
- 1910 24hp. Moto-Reve Twin, Druid, Dunlop, 14 32 and B. Whittle, in new condition; £19/10, or near offer.—Skinner, 63, Bishop's Rd., Cambridge Heath. [510]
- 1910 Triumph, in perfect condition throughout X'All saddle, large head lamp, etc., been well kept; £36.—White, 5, Hargrave Rd., Upper Holloway, N. [528]
- ROVER, 1911, 31hp., clutch model, new Dunlop sp Avon tyres, front stand; accessories, perfect condition; any trial; £35.—W.P., 59, Tufnell Park, W. [X359]
- ZENITH-GRADUA, 31hp., 1911, decompressed backrest, footrest, mirror, all spares; any trial money wanted; £36.—Sutton, 31, Howley Place, Pa dington. [528]
- TRIUMPH, 31hp., mag., h.b.c., dropped frame, fast powerful, good hill-climber; exchange higher price or sell £22.—Agra, Portmore Park Rd., Weybridge Surrey. [521]

# THE MOTOR CYCLE

LEADERETTE:

## The Motor Cycle for Two.

**M**AN, as we have so often been told, is a gregarious animal, and motor cycling, like almost every other form of human activity, affords many proofs of this. After all, what is a motor cycle club but an expression of the universal desire for companionship? It is true that most of the members when they make their tours and runs are on solo mounts, but they have a common rendezvous, and at meal-times and after the day's trip they all meet together. Even here we find frequently that the motor bicycle is made to carry a passenger, and nowadays it is a common sight to see a girl seated on the luggage carrier or some form of seat.

The next stage in motor cycling companionship is the sidecar, and, although men frequently ride together on these machines, undoubtedly the great majority of sidecar passengers are ladies.

Last, but not least, we have the cyclecar—a very wide term which embraces almost any form of motor vehicle for two, from a couple of motor bicycles linked together up to something which can scarcely be distinguished from a motor car; indeed, as our readers know, the R.A.C. and A.C.U. definition of a cyclecar had to be drawn up, so that some sort of dividing line between the cyclecar and the motor car might be established, and already there are a number of machines which are about as near the border line as they can be, and very small modification in their construction bring them over it.

One of the strangest things about the cyclecar movement is that quite a number of people, many of whom ought to know better, seem to imagine that the cyclecar, quadcar, or quadricycle is a novelty—something which they have discovered, encouraged, or prophesied about, when, as a matter of fact, the quadcar is considerably older than *The Motor Cycle* itself. *The Motor Cycle* made its first appearance early in 1903, and about 1899-1900 the motor quadricycle, the antecedent of the cyclecar, was a proved and tested vehicle. No doubt many of our younger readers have never seen such a machine, so we may outline it briefly.

The frame was quadrilateral and fitted with four wheels, the front ones being sprung. The driver sat on a saddle and the passenger in a fore carriage. The engine was attached to the rear axle either behind or in front of the axle, and the transmission was direct by means of a straight pinion and gear wheel. A balance gear was employed, and the design of the axle was either tubular-enclosed, like modern car axles, or bridged like a pedal tricycle.

The levers connecting the stub axles of the front wheels to the steering column were designed to slightly gear down the steering, but it was not irreversible. The average touring speed of the vehicle was sixteen to eighteen miles an hour. With a single gear of 8 to 1 if this speed were exceeded the engine was prone to

overheat, but with an engine of about 350 c.c. quite steep hills were climbed with pedal assistance. Later models had water-cooled combustion heads and change-speed gears.

## Why the Quadricycle Died.

**I**T may be asked how it was that a machine which was well proved, and more than one of which ran successfully in the great and historical Thousand Miles Trial of the Royal Automobile Club of 1900, should have fallen into desuetude. We do not hesitate to say that the four main reasons were ignition, springing, seating, and price; had the quad of twelve years ago been provided with magneto ignition, the chief cause of all its mechanical engine troubles would have been overcome, while the drawback of price was simply that a really good quad cost nearly as much as a little single-cylinder car.

By the time we came to the editorial chair of *The Motor Cycle*, we had ridden some thousands of miles upon quadricycles of various sorts, and we confess that for one we are convinced that, had the makers persisted in them, they would have shared in the same improvements which motor bicycles and motor cars have enjoyed, and the cyclecar of to-day, instead of being regarded as more or less of a novelty by some people, would have been one of the established types of the day.

At the same time, much as we may believe in the cyclecar as a very delightful form of machine for two people, we must not shut our eyes to facts. There must, necessarily, be many people who cannot possibly afford so luxurious a machine. Unquestionably, the cheapest and fastest passenger combination known to man is the motor bicycle with a second seat and properly constructed to carry the weight of two people. Next to it comes the sidecar, which is certainly much more comfortable and in many ways safer, particularly for ladies, as we do not consider that a single-track machine, with a lady sitting sideways is altogether safe, and there is no question whatever that at the present time the most popular vehicle in which motoring and sociability can be combined is the motor bicycle and sidecar, a combination which, moreover, enables the owner, when he desires, to uncouple the sidecar and use his bicycle as a solo mount.

No doubt very many patrons of the cyclecar will come from the ranks of the sidecarists, but, at the same time, while this is so it is equally certain that the motor bicycle and sidecar will remain a combination which will not lose in popularity, as the cyclecar must be more expensive in first cost and more costly in upkeep. We do not say this in any spirit of opposition to the cyclecar, but rather to make it clear that just as the motor bicycle itself is the finest and cheapest means of locomotion known to man, so is a motor bicycle and sidecar the cheapest form of motoring for two.

## Points in the Choice of a Cyclecar.

By B. H. DAVIES

**T**HERE is every sign that 1913 is going to be quite a cyclecar year. The cyclecar offers certain attractions which the sidecar cannot boast, and a distinct percentage of the passenger outfit market should soon fall to its lot. At the same time, cyclecar design is in a state of flux, and the "form" of very few machines put on the 1913 market will be at all fully exposed. We shall have to buy "a pig in a poke" on the strength of the reputation makers have won in other fields, or on the theoretic and paper

A new pattern three-seated 5-6 h.p. A.C. Sociable. The dickey seat may be removed when not required and a luggage grid fitted in its place.

excellences of design, or on the manifest quality of the workmanship. A little preliminary discussion may interest potential buyers, and if taken up by the general public might even exert some influence upon design. There are two introductory points I should venture to lay down quite dogmatically.

### What to Avoid.

The first is that personally I am not particularly keen on a three-wheeled cyclecar of the driving-wheel-astern type, unless its maker can prove to me that it is safe in the event of the rear tyre bursting. I possess a pretty catholic experience of the old tricars, and I never found one that could be termed safe if the rear tyre suddenly deflated. There were one or two types which could be brought to a standstill without danger by a dexterous driver if the burst occurred on a straight broad road of flat camber; but I never tried one which was not highly perilous if a rear tyre burst on a corner, or at speed, or on a sharply cambered surface; while several designs inevitably upset or charged the hedge under such circumstances. Not long ago I was attracted to a certain three-wheeled cyclecar, but the difficulty in connection with rear wheel detachment crowded me off. I admit there are many advantages in a single driving wheel, the chief being simplicity.

The second dogma I state confidently is that nothing would induce me to purchase a cyclecar with an

abnormally narrow track. The reduction of wind resistance is doubtless a valuable point; but a rider who frequents lanes and by-roads with ruts gauged at 4ft. 6in. or more, and is driving a machine with a track of 3ft. 6in. or 4ft., is asking for discomfort. These contradictory factors—the need of a standard track and the need for reducing wind resistance—create a very real problem. Either the cyclecar must have a big engine, and so become heavy and expensive, or it must have a wide track, narrow tandem body, and wide mudguards cleverly planned to be effective without being wind catchers.

A third point may be stated with almost equal arrogance. The ideal cyclecar should have an engine built for the job. The average motor cycle engine—large or small—is not designed to tick over slowly, partly because a motor bicycle is not steerable at very low speeds, partly because there is no room for a big flywheel. A cyclecar is often compelled to remain stationary for short periods with its engine running free: thus an engine which can run slowly is desirable. So I should want a 90° twin, with a big outside flywheel.

### The Seating Arrangement.

Tandem seating is certainly less sociable than side-by-side; but side-by-side seating makes a wind-stopper, and a wind-stopper wants a big engine; and a big engine means £s.d.

As a go-anywhere, all-weather tourist I should see there was plenty of weight on the back wheels. With an engine over the front axle, and a heavy passenger

The two Bedlia cyclecars, driven by Messieurs Bonville and Bourbeau in the International Cup race held in France last week. It will be noted that both machines are fitted with disc wheels.

Points in the Choice of a Cyclecar.—

The sociable type two-seater which has been supplied to H.R.H. Prince George of Battenberg by Duocats, Ltd.

amidships, the desirable stern weight is not easily procurable. If the driver is to sit bang on top of his driving axle, his seat will need very excellent springing.

I have no use for water-cooling. On a light, high-speed vehicle its presence is technically unnecessary, and its details would need very first-class workmanship if reliability is to be secured.

#### Transmission Considerations.

The question of gearing is open. A rigid drive throughout, embodying sliding pinions, shafts, chains, and the like, promises prolonged life, with the minimum of adjustments and incidental expenses. On the other hand, it implies arbitrary ratios, high first cost, complication, and weight. The belt is tremendously attractive for the purpose of a light, high-speed vehicle. It offers infinitely variable ratios, low weight, simplicity, small cost, silence, and silky running. But we cannot altogether surrender ourselves into the hands of designers, if we ask for the belt-drive. We cannot be put off with inferior belts and shoddy fasteners. We cannot be limited to a bottom ratio which is not a true emergency ratio (this is the fault of most variable belt transmissions). We do not want to glaze or scrape our belts by running them slack to get a free engine. I should say that for cyclecar work there are great possibilities about Capt. Low's ancient patents, which employed a double set of variable pulleys in conjunction with a swinging counter-shaft. This afforded a bottom ratio of 12 to 1 with a taut belt on a motor bicycle; and the extra space available on a cyclecar would permit of a wider range than 4-12 if necessary. A single plate clutch might complete such a transmission.

#### Springing and Brakes.

Having kept the specification so extremely light and simple so far as I have gone, I should dislike the introduction of a heavy steering gear, and I applaud those makers who adopt the reel and cable steering in duplicate. I would not readily trust my life to a single cable, however many millions of tons represented its theoretic breaking strain, but nobody can cavil at cables in duplicate.

As the road vibration is bound to be marked on a 7 cwt. vehicle travelling at upwards of 40 m.p.h. on occasion, I would not look at a machine in which all nuts were not cotted or spring-washed, and I

should pay very careful attention to the springs, and especially to the subsidiary spring dampers. Half-elliptics forward and full elliptics aft may serve a car that weighs a ton, though the huge sale of auxiliary insulators in the car world shows that four plain springs are not sufficient, even on a heavy vehicle. A cyclecar presents many problems, but its springing is the most acute of all. Many existing patterns are at present grievously handicapped by engine vibration, and when this is eliminated by the development of special engines and carburettors, road vibration will come more definitely on to the *tapis*. Then the frame springs will have their well-marked oscillations smoothed out by small auxiliary coils, or other absorbers. Brakes must not be forgotten. My outline specification permits of belt rim shoes on the back wheels, and a double set, one within the rim and one without, should provide the cheapest and most reliable four-wheeler brakes on the road, and represent an infinite advance on the internal expanding hub type or the external band, both of which are chiefly remarkable for rapid wear and frequent adjustment.

With the type of engine indicated, starting on magneto-ignition by a crankshaft handle is easy and reliable, and no difficulty would be encountered except with very high compression ratios, when the addition of a decompressor would enable the engine to be swung like the four-cylinder vertical type can be.

AN ENTHUSIASTIC LADY MOTOR CYCLIST.

Mrs. Tucker, of Torquay, with her  $3\frac{1}{2}$  h.p. open frame Premier, of which she is a very enthusiastic rider. In writing to us, Mrs. Tucker says: "I love motor cycling, and think it is great sport. My machine climbs all hills in Devonshire with a  $4\frac{1}{2}$  to 1 gear." Hill-climbing is her chief delight.

### Points in the Choice of a Cyclecar.—

Finally, I think designers will discover that the cyclecar on motor cycle lines as opposed to the same vehicle on car lines will appeal principally to sporting individuals who value speed and a rakish appearance above everything else. Recumbent seating a burlesome exhaust, and a skeleton body, set such a one's heart beating every time, when a docile, silent, miniature two-seated vehicle appeals to the tourist. One word to prospective purchasers and I have done. The great strides which have been made in the design of sidecar combinations will prevent any falling off in the demand for these vehicles, and already I know

of more than one firm who will fit 3in. tyres as standard on their sidecar models for next year, as well as springing the rear portion of the bicycle. One of the drawbacks of the old quadricycle, which anteceded the cyclecar, was lack of springing at the rear: sidecar machines followed the example. In 1913, with 3in. tyres and springing fore and aft, the sidecar should quite hold its own with cyclecars, particularly where price is a consideration. There will, however, be a big demand, and the Olympia cycle and motor cycle show will be made additionally interesting this year by reason of the number of cyclecars which will be exhibited

## A RUN ON THE LATEST SABELLA.

**W**E recently had a run on the latest type of 8 h.p. Sabella cyclecar (the Sabella Car Co., 110, Albany Street, W.) This vehicle is driven by an 8 h.p. J.A.P. engine, as are so many of the light cyclecars now on the road. The engine has an additional external flywheel, and is cooled by a fan driven by round belt off the mainshaft. The transmission

from the engine to the ball bearing counter-shaft is by chain, and thence to the two rear wheels by long belts. The alteration of the gear ratios and the taking up of the slack of the belt is effected by means of two levers, one of which expands and contracts the pulley, and the other pushes back or draws forward the rear wheels and applies the brake. The particular vehicle on which we were given a trial run is well turned out, being fitted with a comfortable body, provided with side doors, and both hood and screen. Being fitted with a Lukin carburetter, the engine was extremely flexible and controllable, picking up quickly and yet running slowly when desired on top speed and when in neutral. In the course of our run we took Fitzjohn's Avenue at a good speed. A good ascent was also made of Netherhall Gardens, maximum gradient 1 in 7.8. This is the first time we have ascended this well-known London hill on a belt-driven cyclecar. The springing was a trifle stiff owing to there being one leaf too many in the new springs. The sociable model as shown in the accompanying illustration is standard for 1913.

A well turned out two-seater. The dome-shaped dash, roomy and well-upholstered body, Cape cart hood, wind-screen and mudguards to pulleys are noteworthy features.

An impression of the Cohendet cyclecar at speed in the French Road Race. This machine is made by a large firm of engineers whose works are in Paris.

### The Life of Epicyclic Hubs.

It would be very interesting to hear the experiences of riders who have covered long mileages with any of the popular epicyclic hubs. Like most journalists I have owned and used samples of practically every make of hub gear; but the very need for a sample experience of every make prevents me from running the hubs to destruction. I have used several types for distances of from 2,000 to 4,000 miles, and when I passed on to another make each sample was apparently in perfect order and possessed a clean record. Could I say as much, I wonder, if I had run the hubs for double the distance? I was in a gear making shop the other day, and its manager frankly expressed the opinion that the modern three-speed hub contained too many small parts to stand up in prolonged wear: he prophesied that within a season or two there would be a general reversion to two-speed hubs, in so far as the hub gear survives at all, because the fewer the parts, the more substantial the hub. Of course, he was talking with an eye on his own trade, for he happens to own good two-speed hub patents, and has no interest in any satisfactory three-speed hub patents. But he has the courage of his opinions, for he is laying out considerable capital on booming a two-speed hub next year. The great army of private owners should by now have some definite information on this point. How soon does a modern three-speed hub begin to require attention from the makers? Of course, nobody would grumble at expending, say, £1 in repairs at the end of a hard season's work.

### Belts and Chains.

It may well be questioned whether Mr. Wyatt's belt experiences (page 1009, issue of September 5th) are typical or representative. My own experiences this year have been mixed. I had ceaseless trouble with belts last year, and early this spring ordered belts of another make, which were even worse than the brand I patronised in 1911. In fact, during a thousand miles ridden in July I wore out two new belts, and had innumerable roadside stops. In August I again changed my belt maker, and also began to ride another machine. The July machine had an engine which worked best on a  $5\frac{1}{4}$  to 1 gear, and was planned for a  $\frac{7}{8}$ in. belt. The August machine was geared  $4\frac{1}{2}$  to 1, and utilised a 1in. belt. With this combination—big belt and high gear—I have encountered no transmission troubles at all during a prolonged distance. In fact, it almost approximates to the excellences of a  $2\frac{3}{4}$  h.p. machine with combined drive. I really believe that the best existing "no trouble transmissions" are (1) combined drive, with  $\frac{7}{8}$ in. belt for  $2\frac{3}{4}$  h.p. or 1in. belt for  $3\frac{1}{2}$  h.p., and (2) large belt and large pulley, used as a direct drive. My experience is that the front chain of a combined drive wears distinctly better than the front chain of an all chain drive. The shocks which survive the cushion device

on the crankshaft encounter a rigid transmission aft, where the remainder of the drive consists of chains, or of chains and gears; but when the final item of the drive is a belt, they have nothing solid to act upon, and seem to lose something of their ferocity.

Of course, many adherents of the belt drive use inferior belts and inferior fasteners. Despite advertisements I find great differences between various makes of belt, and in the same way there are fasteners which never break, and fasteners which seldom last a thousand miles.

### A Genuinely Clean Crank Case.

Worrying around with my microscope at the Coventry and Warwickshire M.C. Hill-climb I found something new—a crank case from which not even the faintest shadow of a green blush emerged. At the scales I found that a certain new model nowhere exhibited the trace of an oil leak. You can guess that I hurtled up to the summit and pounced on those engines after they had finished their timed sprint. But no! Their riders had not been busy with a lump of waste—the crank case is genuinely oiltight. I found a slight flaw in the joint edge of one aluminium crank case cheek, and furtively turned the engine over compression a few times to see if I could not get a leak there: oil was lying just under the flaw, but when you pulled the belt round this oil was sucked in, not blown out. Here was a mystery—evidently ascribable to a vacuum valve. Now if a new firm manufacturing an engine with a patented method of lubrication, can get a positively oiltight crank case at their first shot, what excuse is there for veteran designers whose engine pits simply leak oil in all directions and even throw some on to the rider and ruin his clothing?

STREATHAM AND DISTRICT M.C.C. OPEN HILL-CLIMB.

## QUESTIONS & REPLIES

SPJ

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Local Taxation.

**?** In March I bought a second-hand 1911 T.T. Triumph, for which the licences were taken out at once by me, including the £1 tax. About six weeks ago I bought from a friend a 1912 T.T. Triumph, which I have been riding ever since. I still have the 1911 machine, which I am advertising for sale. Since having the 1912 machine, I have only ridden the 1911 one on, I think, one occasion, when I rode it a short distance this week for the benefit of a possible buyer. Now the licensing people are making enquiries re my having paid the tax, and, as I am quite ignorant on these matters, I do not know how to act. I do not want to pay £1 when I hope to have the machine sold by next week.—G.O.F.

As you have used the 1911 vehicle on one occasion, you are liable for the tax for both vehicles. One licence only enables you to use one machine at a time. We are afraid you will have to pay the extra local taxation licence, as you have rendered yourself liable for it by using the machine.

### Engine Timing.

**?** I removed the timing case of my 2 h.p. 1912 single-cylinder Humber cycle to fit a new pipe washer, as it was leaking badly, and in removing case the inlet valve wheel and large intermediate wheel came away with the case. I should be much obliged if you would tell me how to reset the timing. There are two punch marks on inlet wheel, three on camshaft pinion, and one on exhaust wheel, but there are no marks that I can see on the large wheel or on the magneto wheel.—J.D.

Without seeing if the marks are on the teeth or below them we cannot tell you how to retime your engine by the marks. The correct timing is as follows, and will easily be found with a little care. The exhaust valve opens when the piston is 6-7ths of its way down the firing stroke (in your case about 10 mm. from the bottom dead centre), and closes dead on top, or, if anything, a shade after. The inlet opens directly the exhaust is closed and shuts just after the piston has passed the bottom centre. The piston then rises, compressing the mixture, and

the spark should take place, i.e., points of magneto contact breaker should separate, when the piston is about 3 mm. from the top of its stroke.

### A Curious Click.

**?** I have a 1908 twin 5-6 h.p. N.S.U., rear cylinder, vertical, front ditto inclined at 45°. On ordinary undulating roads the machine runs well, and is a fairly good hill-climber. It starts easily and fires regularly. My only trouble is on the long gradients. Here (Devon) after running up hill for some distance there is a decided clicking noise in the back cylinder, due, I believe, to slight pre-ignition. On the old carburetter, closing the air inlet slightly would cure the trouble for a time, so will retarding the spark considerably, but in both cases there was a decided falling off in power, and now I have an automatic carburetter. The magneto adjustment is the only one I have. This, of course, reduces the power available, and the engine gets a lot hotter, and soon fails. When there is carbon deposit in the cylinder it is more common, but scraping out the cylinders does not stop it. The compression in both cylinders is good. Would reducing the compression in the back cylinder by fitting a plate between the crank case and the cylinder improve matters? If so, what thickness of plate would you suggest for experiment? (I understand about lengthening the bolts and tappets.) This should allow the back cylinder to work cooler, and at the same time not affect the front, which is apparently working all right, but I would increase clearance in both cylinders if you think it would be any advantage to do so. I do not object to reducing the speed, as the machine is faster than I care about on level roads. The sidecar is always attached.—PS 71.

The click is very probably caused by a slack small end bearing. If it is, as you suggest, caused by pre-ignition, and your automatic carburetter is a modern one, try throttling down a little when the knock occurs. This will not reduce your power as much as might be expected, and will keep your engine cooler. If you decide to lower the compression, raise both cylinders the same amount (about 1/16 in. should suffice), but do not alter one only. Are your inlet springs strong enough? Weak springs often cause a curious click.

SOUTH BIRMINGHAM M.C.C. NOVICES' HILL CLIMB AT STYLE COP.

L. A. Bees (3½ h.p. L.M.C.) and — Roberts (3½ h.p. Triumph) near the summit of the hill.

**Loss of Power.**

**Q.**

Has it ever been discovered where the power of old engines goes? I have a 5 h.p. twin-cylinder machine on which I have covered about 32,000 miles. I have just given the engine a thorough overhaul, fitting new bushes everywhere, new crank pin, gudgeon pins, piston rings, valves, and springs. I cut the cylinders away round the valve seatings so that there was no fear of valves pooketing; the magneto I had overhauled and remagnetised by the makers. I took great pains to get the bushes a nice fit, and the piston rings I ran in getting splendid compression; valves and ignition are timed correctly, and carburetter is in order. Exhaust pipes and silencer I took to pieces and cleaned, yet, after all this, the machine is nothing like it used to be. At one time it would easily do 56 m.p.h. and climb all hills about here with two np on a 3 $\frac{1}{2}$  to 1 gear; now, after about 600 miles running, 42 m.p.h. is the maximum speed, and a mere struggle up anything like a hill. Here is an engine apparently in perfect order, yet the power cannot be restored.—B.G.D.

It is a difficult matter to answer your question, but granting all adjustments are as good as they were there are certain possible explanations. Possibly your cylinders require regrounding. After a certain time most metals subjected to shocks suffer fatigue which affects many of their qualities. Did you have to cut away much metal round the valve ports? as this would lower the compression. The most likely cause of loss of power is wear in valve gear. Are your cams and rockers worn? A small amount of wear in these parts has a considerable effect on the power; even slackness in the gear teeth makes a difference, especially on a twin. Are your valve springs strong enough? If you have atmospheric valves, are they a good fit in their guides? Springs strong enough? Springs of equal strength? Do they get much lift? 3-32nd of an inch is usually ample for automatic valves on a 5-6 twin.

**Heat in a Motor Shed.**

**Q.**

I am purchasing an A.C. sociable, but find that our own county (Gloucestershire) will not register the machine as a motor cycle or tricycle, owing to the weight. Can you tell me any county where I can register the same for the 5s. fee? I have built a wooden shed for keeping the vehicle in, and find on hot days that the temperature rises to over 80° Fahr. This, I think, must be detrimental to the tyres. The place is thoroughly well ventilated, and I have had various suggestions as to the cooling. What would you suggest to cool the place, and what temperature is the most suitable to preserve rubber? Perhaps other motorists have a similar trouble.—F.W.

It is doubtful whether any county will register the A.C. for the motor cycle fee. You will have to register it as a car, but you need not pay the car local taxation licence, owing to the fact that the vehicle is a three-wheeled one. Take out a local taxation licence for a motor tricycle, and pay £1. Indiarubber articles certainly last longer if kept in a

cool, dark place, but when the weather is really hot the temperature in most sheds would rise to about 80°, and we do not think you could avoid it in the case of a shed. The best method of keeping it as cool as possible is to whitewash the roof and sides on which the sun's rays strike longest. Watering the floor will also be a help, and a tray of water might be placed in the shed in very hot weather; the evaporation will keep the heat down to some extent.

**Carburetter Troubles.**

**Q.**

I have an old Minerva machine fitted with a B. and B. carburetter (jet No. 32 or thereabouts). The engine runs beautifully, but every 100 yards or so the carburetter wants flooding; sometimes it will go for a mile or two and then wants flooding again. There is no floating obstruction, and the needle valve seems to work freely enough. The joints are all tight and good. I have ground inlet valve in, also needle valve in carburetter; the level of petrol is also right; in fact, I have tried everything I can think of without avail.—F.G.W.

Evidently the joints of the weights on the float are badly worn and stick occasionally. This is a fairly common trouble in old carburetters. You had better replace the parts which control the movement of the needle valve, if they appear to be much worn.

**EXPERIENCES WANTED.**

—“S.H.” (Wolverhampton).—T.T. Rudge multi and sidecar.

—“H.W.T.” (Hampton Wick).—3 $\frac{1}{2}$  Lincoln-Elk with or without speed gears.

—“R.B.” (Dublin).—Mead-Precision. Hill-climbing, speed, and petrol consumption.

—“H.C.” (Haywards Heath).—Triumph, Bradbury, Excelsior, and Douglas, with sidecars.

—“T.H.” (Normanton).—Roc two-speed fitted to 3 $\frac{1}{2}$  Humber with and without sidecar.

—“F.M.” (Putney).—1911 T.A.C. with sidecar for hilly districts, also Indian and Clyno.

—“R.H.” (Pitlochry).—3 $\frac{3}{4}$  Scott with sidecar. Reliability, consumption, hill-climbing, and lubrication.

—“S.G.I.” (Middleton-in-Teesdale).—6 Enfield, 6 Zenith, Clyno, 4 James (chain driven), and 4 $\frac{1}{2}$  Excelsior, with sidecars.

**READER'S REPLY.**

**Mysterious Misfiring.**

Your querist on misfiring, “J.G.S.,” in a recent issue of *The Motor Cycle*, states that he thinks it is not caused by oil in the magneto. It is curious that I had precisely the same symptoms and the same results with the exception of improvement on advancing the ignition—true, I have a 5-6 twin, but that is not very different for the complaint spoken of. I was bothered with chronic misfiring and explosions in the long exhaust, which is equivalent to your correspondent's silencer. This I stopped by removing the carbon brush from the magneto and inserting a rod covered with a piece of petrol-soaked rag; I then moved the engine, thus making the armature revolve and clean itself on the piece of rag. By doing this occasionally I have cured the trouble. I do not, of course, know the position of “J.G.S.'s” magneto, but mine gathered lots of oil from the seating of the cylinder which worked its way in, although the magneto is supposed to be oil-proof! I had somewhat similar trouble with another 5-6—this was caused by losing the lock-nut from the platinum screw in the magneto, thus the point gradually worked through the rocker-arm till it shorted on the other platinum.—L.R.

**DUTCH MILITARY MOTOR CYCLISTS.**

A group of Dutch Volunteer Military Motor Cyclists studying maps in connection with the first exercises undertaken by the corps.

## AMONG THE ACCESSORIES.

### To Prevent Wear of Sidecar Bearings.

We have just received a sample of a new registered sidecar hub, the novel feature of which is the gutter-like projection at the inside end, extending over the cone. It is claimed for this that it is

A new sidecar hub which is fitted with a mud catching trough on the inner end.

practically impossible for grit to enter the bearings, even during the worst possible weather. The sketch of the gutter-like projection and hub end is practically self-explanatory, but it may be added that the construction allows muddy water to run down the hub end and drop off the fixed portion of the axle without it entering the bearing ball race. If it is desired to make the hub still more waterproof, a felt pad can be inserted in the hub end. This idea is an improvement of the old tip among pedal cyclists, who used to wrap chenille round the axle close to the hub, so that the latter revolved against the edge of the chenille. The hub is the production of F. J. Horton and Co., Theodore St., Birmingham.

### Night Riding.

One of the most annoying things in connection with night riding is a defective acetylene gas burner. Readers who make use of the Bray Roni burner will be interested to know that one of the chief features of this burner is that it is of the air injecting type and will not carbonise. The flat flame it gives is produced from a single gasway only, and cannot therefore become distorted and crack mirror or lens. Finally, a great improvement has recently been introduced by the insertion of a pressure jet, which prevents flaring when the burner is subjected to excess of pressure of gas due to decomposition of the carbide.

### A Useful Electric Lamp.

A useful accessory which has been lately introduced by Messrs. Siemens Bros. and

Co., Ltd., is the Satchell electric lamp, which was used by Harold Kars-

lake in the M.C.C. London to Edinburgh run this year. The lamp consists of a substantial waterproof black leather case, stiffened internally with wood, containing a Siemens dry battery. The lid is secured by means of glove button fasteners. In the lid is a Siemens Wotan lamp, carried in a suitable reflector, and at the side is a switch mounted on an ebonite base. The best quality lamp is supplied with a leather belt, so that it can be strapped round the waist, and also a leather shoulder strap, so that it can be slung round the neck. The battery is fitted with plug sockets and the connections to the lamp and switch are made by means of plugs, which can be withdrawn from the socket when the lamp is not being carried.

### To Prevent Petrol Splashing.

The accompanying sketch is that of a patented device for fitting to filler caps of petrol tanks, which, although admitting air, prevents splashing. The cap is fitted with a light cone valve, which is immediately closed by the upward splashing of the petrol. The top of the centre tube is closed, and a small air hole is provided at the side of same. The makers, the Bowen and Odery Manufacturing Co., 62, New Cross Road, S.E., inform us that the device has given perfect satisfaction during a very lengthy trial of nearly a year

## HINTS AND TIPS FOR MOTOR CYCLISTS.

By "ROAD RIDER."

### THE CRANK CASE DRAIN TAP.

**379.** Few riders make sufficient use of their crank case drain taps or plugs; indeed, many are unaware that engines are provided with such fittings. The crank case should always be drained after a prolonged ride, or before essaying the ascent of a really trying hill. Oil loses a great deal of its lubricating value after it has been circulated around the engine for some time, and the oil remaining in a crank case is frequently almost entirely destitute of any genuine lubricating value. At timed hill-climbs it is a common thing for the "cracks" to empty their crank cases, and start their timed sprint on entirely fresh oil. Moreover, the habit soon informs a rider if he under or over-oils his engine, and is thus a partial preventive of carbonisation and worn bearings.

### A SUBSTITUTE FOR VALVE GRINDING.

**380.** Every rider knows that when the compression grows weak, the pits are generally confined to the valve face, the whole ring of the valve seat being usually bright and clean and smooth. Most of the up-to-date factories possess special valve-facing machines, and are willing to reface customers' valves for a trifling sum. It, therefore, pays to send the valves to the factory instead of grinding them in at home. The job is better done, and there is no fear of getting abrasive into the cylinder. If the seating is not perfect, a very few turns of a brace with a thin

smear of fine abrasive will make the seating match the valve; but, as a rule, a re-faced valve may be slipped straight into the engine without any grinding at all.

### A DECEPTIVE CAUSE OF FLOODING.

**381.** Often a carburettor seems to be flooding, and induces its foolish owner to grind in the needle valve or adjust the level, when in reality the trouble is of quite another nature. Many modern carburettors have removable jets, and the joint between the jet and its socket is made petrol tight by a fibre washer. The least speck of grit between this fibre washer and its seating will cause a petrol leak, which may appear to be due to false level or a worn needle valve. Hence, whenever the jet is taken out, the fingers should be spotlessly clean, and the jet should not be placed on any dirty or gritty surface.

### VOLUTE CARBURETTOR CONTROL SPRINGS.

**382.** One or two modern carburettors are fitted with "volute" return springs on the control wires, in lieu of the old coiled springs. The change is due to the fact that the control slides are removable by a bayonet joint in the cap of their tube, and while the coiled springs were retained, some difficulty was experienced in twisting them round in their tube when the bayonet cap was replaced; this difficulty was not met with volute springs. But the volute springs are rather apt to rust and grow sluggish, so they have given

rise to a new form of carburettor trouble. The rider thinks his air and throttle slides are sticking, whereas in reality the springs are rusty and adhesive, so that washing the slides with petrol or paraffin is useless. The cure is to oil or grease the volute springs at frequent intervals.

### THE STAND AS A SPRAG.

**383.** When a motor bicycle possesses a variable gear in addition to a sprag, it is easy to effect a restart on steep gradients in the fashion employed by car drivers. The extra leverage afforded by the low gear ratio enables the driver to hold his machine with the clutch during that vital moment between the release of the brakes and the taking up of the forward drive by the clutch. The case of a single geared free engine machine is widely different. Such a sprag is available on practically every machine in the shape of the back wheel stand. Before a clutch restart is attempted with a single-geared machine on any awkward gradient, the stand should be let down, and its tips should be scotched well into the road surface by the pressure of the foot. This done, almost any single-geared F.E. machine should restart on grades up to 1 in 9 at any rate. If the clutch be hand-operated, the restart should be possible on any gradient whatsoever, for the rider can assist with his feet. With a foot-operated clutch, a restart is more difficult on really severe gradients.

## "ON MANŒUVRES."

**A** WEEK'S experience with the cavalry in East Anglia may perhaps be sufficient excuse for wearying readers of *The Motor Cycle* with a few hints and tips, especially as the new arm has started with such success that it would be a pity for those who join the forces on grand manœuvres not to benefit by the lessons of the last few days. The *Times* special correspondent has praised the army motor cyclists in no sparing fashion.

The motor cyclist in a country without (?) roads is *par excellence* the best medium of communication. He is, of course, only valuable behind the screening troops. . . . as he always gives sufficient warning of his approach to enable a patrol to catch him. The motor cyclist service during the cavalry reconnaissance has been furnished almost exclusively by the Universities' O.T.C. These men have worked excellently, and their daring on the road is at times appalling.

Such eulogy, from one of the highest authorities on military matters in this country, should be no small stimulus to those called out for manœuvres.

### Where to hide Despatches.

It will be noticed that the *Times* lays far more stress on despatch carrying than on actual scouting, though the former is no less hard work than the latter. The despatch bearer must be always alert for signs of the enemy, he must learn to use covered roads as much as possible, and to detect the hidden foe at a distance. His despatches are vitally important. Even if he be captured small harm is done unless his message falls into the enemy's hands, thus exposing the intentions of his commander or the like. Despatches should not be hidden in the cap or puttees, as these are the customary places; it is best to put them inside field glasses, Patchquick tins, collars, or any less likely spot. Exceptionally important messages should be learnt by heart, then in case of imminent capture the message can be destroyed quickly—the best way is to swallow them. Non-committal discretion is the best policy for the captured bearer of despatches. The enemy is

only empowered to demand his name and regiment (*i.e.*, to whom he is attached), and although it will indubitably demand more it must be choked off.

As regards work, the average mileage seems to vary between 60 and 100 per diem; the smaller figure for lightweights used for short distances, and the larger for more powerful machines. The rider is always liable for duty. He must forego all except the minimum of sleep, and get what meals he can. Plain chocolate is an excellent standby; bread and cheese are easily obtained, and so, of course, is liquor. The amount of kit carried varies with individual taste, but it is advisable to carry on the machine a change in case of rain, a good overcoat for night, and toilet accessories. One blanket and one ground sheet are generally supplied to each man. Of course, the next night's sleeping place is totally unknown, and may be miles from anywhere; therefore the rider must be complete in himself, but not so overladen with kit as to be too slow for practical purposes.

A map is essential—these may be issued, but the supply is already insufficient. Without one, the cyclist is continually hampered and quite inefficient. A celluloid map case is convenient to protect the map from the weather.

### Riding with Troops.

It has been found that riding with the troops is bad both for troops and machines. It harasses the horses, and overheats the engine.

A few "don'ts" as a finish:

*Don't* expect information on every subject. Most people don't know; those who do, won't say.

*Don't* stop when you have a message to deliver—unless you break down, then

*Don't* forget to let your officer know you are *hors de combat* for a time.

*Don't* give away information to civilians; they will probably tell the enemy. C.J.G.

THE MOTOR CYCLE IN THE ARMY.

(1) The Maxim gun of the 5th East Yorks (Cyclists), who are taking part in the Army Manœuvres. It is drawn by a 3½ h.p. two-speed Bradbury. The complete equipment weighs about 8 cwt., and has proved very satisfactory. (2) The same gun followed by the team.

## In the West Country on a P. & M.

SOME months ago we were promised a trial of a 1912 Phelon and Moore, but it was not until the time of the Six Days' Trials that matters could be satisfactorily arranged. The makers appeared particularly anxious that we should test the machine under such severe conditions as had been arranged for the 1,000 miles trials, and as for ourselves we felt that no better machine could be selected, and as events proved we would not have exchanged our mount for any in the trial. The day before the start of the memorable event we set out from Coventry for Taunton *via* Cheltenham and Bath, and except for the fact that this initial run provided our only involuntary stop on the road while the machine was in our possession, the journey down was devoid of incident. The machine had been sent out with the high tension wire hanging loose, and resting on the cylinder the rubber had burnt through and caused a short circuit. All that was necessary was to stretch the wire.

### Belt and Chain Drive Compared.

The writer is more accustomed to riding belt-driven machines than chain, and consequently was interested to observe the difference in the comfort of chain and belt transmission. There certainly is a difference, a slight tremor being conveyed to the handle-bar grips and footrests with the more positive drive, but by the end of our test we were convinced that this was more than counterbalanced by the absolute reliability of the chain under all weather conditions.

Starting from cold is sure and certain with a P. and M. after injecting a few drops of petrol into the cylinder *via* the tiny pipe provided, and the engine does not go off with a roar on giving the kick starter a dig, thanks to the half-compression device. As for the gear we have nothing but praise; the clutches take up the drive sweetly and without jar, and it is chiefly the smooth action of the clutches which render the big jump from the low to the high ratio less noticeable. Hill-climbing is a delight with a P. and M. No matter how steep the gradient, nor how wet the road surface, one has a feeling of absolute dependability after a little experience.

### Devon and Somerset Terrors Climbed.

Beggar's Roost and its 1 in  $3\frac{1}{2}$  gradient, Porlock, Lynton, and Bybers, to mention but a few of the chief acclivities which accounted for so many failures in the Six Days' Trials, have no terror for the P. and M. rider. As we climbed merrily up single figure gradients past crestfallen riders who were struggling with their machines by the roadside we think that many a one would have given worlds to exchange machines. We will not dwell upon the hill-climbing capabilities of this machine, as its prowess in this direction is patent to every reader who makes a study of Six Days' Trials results, but we should in particular like to refer to an achievement on the part of our mount on the last day.

The machine was not new from the works with an engine tuned up to concert pitch; it was, in fact, the identical machine on which W. Pratt carried off the special trade prize in the Scottish Trials a week or two previously. Consequently the engine had run a

considerable distance before it came into our hands. With the run to Taunton and several hundred miles in close company with the Six Days' Trials riders, many a machine would have lost long ago that excellence necessary for the steepest ascents. Not so the P. and M., which had never had its valves attended to, its jet changed, or, in fact, any other attention beyond filling with petrol and oil, twice tightening the rear chain by means of the simple chain stay adjustment provided, and twice adjusting the gear—an operation entailing one minute's work.

Porlock on the sixth day of the trial, with its unspeakable surface, was admittedly the *pièce de résistance* of the trial, but the P. and M. forged its way to the summit, and only once success hung in the balance. That was at the second corner when the engine commenced knocking; simply because the rider was too busily engaged in keeping the machine erect on the slimy surface to give the levers the attention demanded on such a precipitous gradient. Later in the morning, and in fact after rain had fallen constantly for three hours, the writer made another ascent in the presence of Professor Sharp, Messrs. Brooker and Evans, the A.C.U. officials.

### General Equipment and Impressions.

Band brakes are frequently criticised in these columns, so we feel it our duty to report that the rear outside band brake was most powerful in action, never once required adjusting, and its only fault was squeaking when under severe strain. There seems to be a general impression that the P. and M. is not a fast machine, and we to some extent share this view. The opinion has no doubt clung to the machine since its early days, but we found the 1912 model as fleet as the majority of  $3\frac{1}{2}$  h.p. machines, and discussing this subject with the makers received the assurance that every one now turned out will attain a speed of 50 m.p.h. on the road.

One more important point in which the P. and M. departs from current practice is the position of the engine, inclined and rather high up in the frame. Wiseacres who knew that the machine was strange to us, predicted rolling and skidding on the Devonshire grease, but here again the machine belied their words, for our confidence in its stability soon became such that we bowled along over treacherous surfaces, overhauling one after another competitor (as indeed it was necessary for us to do), and seldom if ever did we detect a suspicion of a skid.

Certainly, in a large measure, praise must be accorded to the Kempshall tyres, which not only stood up as no rubber tyre of our experience has done, but, moreover, never punctured throughout the test. We may add that the identical pair of tyres went through the Scottish Trials with the same result.

Finally, we must tender our thanks to Mr. Richard Moore, of Messrs. Phelon and Moore, Ltd., for the loan of the machine. It came to us equipped as a first-class machine usually is, and our experience would only prompt us to offer the following suggestions, viz., that the gear change lever be placed further along the tank away from the rider's legs, and that the foot brake pedal be arranged on the orthodox side, instead of being operated by the rider's right heel.

# AVON TYRES

**More trouble in the Far East?  
Possibly—but not Tyre trouble!**

**Where the Avon policy prevails there  
is peace and an infinite content.**

## **FROM LONDON TO CONSTANTINOPLE BY MOTOR CYCLE WITHOUT A SINGLE PUNCTURE**

**Mr. A. Pratt, famous as the motor cyclist who recently completed this  
hitherto all but impossible journey, sends us a postcard from  
Constantinople as follows:—**

“CONSTANTINOPLE,

“Sept. 3rd. 1912.

“You will be pleased to know that my AVON TYRES have been perfect.  
“In the journey from London to Constantinople, over mountain passes, sandy  
“plains, and hundreds of miles of the vilest roads—I have not had a single  
“puncture. Please accept my sincere thanks for having saved me from  
“tyre trouble.

“Yours faithfully,

“A. PRATT.”

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

### Inglorious Devon.

Sir,—Devon is one of the few counties in this country which will not hand over its main roads to the county authorities, each section being controlled by the rural council in whose district it lies. The county surveyor can exercise no proper supervision over them in these circumstances, and the result is what we find. Small wonder that the Road Board will not assist.

SIDESLIP.

### The Definition of Cyclecars.

Sir,—A letter in your last issue, signed John D. Rowland, suggests that the new Singer cyclecar is out of your province. I, for one (and I know many others), was pleased to see the illustrations of this smartly designed four-wheeler. It certainly does appear to be on the border line (as you pointed out in the descriptive article), but I really think that the artillery wheels give it a heavy appearance. If only the Singer Co. would fit detachable wire wheels, it would look lighter (though it might not be actually lighter), and further, the vehicle would be more in keeping with a cyclecar. I look forward with great eagerness to further references to this cyclecar in your journal.

W.S.

### Power for Sidecar Work.

Sir,—I am much interested in this discussion, particularly the contribution by "Experto Crede" on the ideal machine for Scotland. He recommends the 6 h.p. Zenith, but three indispensable adjuncts to serious sidecar work are wanting, viz., chain drive, kick start, and free engine clutch.

After using my two-speed chain drive Bradbury for 1,600 miles, with sidecar, on Scottish roads, without even shedding the passenger on any hill, and this without ever touching engine or chains, I naturally conclude that a big single has ample power. I would suggest that in the next A.C.U. Six Days' Trials, every engine of 500 c.c. and over should take sidecar and passenger, for I think it ridiculous that machines of 2 h.p. to 8 h.p. should compete in the same class.

NIL DESPERANDUM.

### Cattle on the Roads at Night.

Sir,—In reference to the remarks by your correspondent, Mr. Fred Matson, regarding cattle straying on the roads, etc., I should like to tell you my recent experience. When I read his letter I thought what a danger such would be at night, and since have had the fact forced home on me. I was riding a 2½ h.p. machine with passenger on the carrier, having to traverse about five miles of rather narrow and winding road. I came across two flocks of sheep. The first flock was just round a corner. Some of the sheep were grazing by the roadside and the others lying in the middle of the road. I narrowly missed these and made the determination to keep a sharp lookout in case of a recurrence.

I had got my journey nearly over, and had got back to the main road when I met a second flock. This time the result was disastrous alike to the machine and to myself and passenger, the machine being damaged severely.

Surely something should be done if cattle-driving after dark is to be allowed. The least that could be done would be for the drivers to carry a red lantern to warn road users of the danger. Of course, this being in the night neither of us saw the sheep until we were too close to stop.

With best wishes for the continued success of your publication,

F.H.W.

### A Problem that Baffled.

Sir,—May I ask in the columns of *The Motor Cycle*, your correspondent "Elucidator" (September 5th), whether he would object to my putting his "statements" in this way.

Motor cycle, 3 cwt. load, has 6 feet head resistance, and motor car, 30 cwt. load, has 30 feet head resistance. (So far I agree for the time being.) Thus motor cycle for each windage-unit meets half load-unit.

Motor car for every windage-unit meets one load-unit. So

Motor cycle, six windage-units  $\times$  half load-unit = three windage-load units.

Motor car, y windage-unit  $\times$  one load-unit = thirty windage-load units.

Load-windages (three to thirty) are not as one to five, as is the petrol consumption

If "Elucidator" objects to this, please say why?

WRANGLER.

### Brakes in the Six Days' Trial.

Sir,—The comments of the judges on the behaviour of the brakes during the Six Days' Trial have naturally been perused by us with considerable interest. Most manufacturers fit their own rear brakes by means of rod and lever applications. It is with the front brakes that we are particularly concerned, inasmuch as we, or our licencees, are responsible for the production of almost every front brake that is used on a motor cycle to-day and applied by Bowden wire mechanism. While we are not responsible for the fitting of them, manufacturers themselves doing that part, yet we are well aware of the great difficulties that are presented in fitting them effectively. The peculiar design of some front forks has a great deal to do with the question. Generally speaking, however, our front brakes can be fitted with the utmost efficiency, but we, and makers, recognise the extreme danger associated with making these brakes act as effectively as they can be made to act. The front brake is one which must be used with extreme caution, and we should never

Two Westmorland lady motor cyclists, the Misses M. & A. H. Beck, with their 3½ h.p. Rudge machines. The above photograph was taken as they were leaving St. Albans for North Westmorland—a distance of 270 miles. After reaching Grantham rain fell all the time till they reached their destination.

advise that it be adjusted so as to lock the wheel as quickly as the back brake, as anyone who rides a motor cycle knows that under certain conditions to jam on a front brake is to court disaster. Speaking from many years of experience we say that the leverage afforded is generally sufficient, and it is certainly so on our own designs. We would approach with great hesitation the alternative suggested by the judges in the Six Days' Trial. To adopt a method of applying the front wheel brake to the rim at an angle of, say, forty-five degrees to the direction of rotation would be putting much too great a power of retardation in the hands of the rider. Under ordinary circumstances, and under certain conditions, the presence of mud and grit might cause a sudden dead-lock with disastrous results. Even if it were desirable, in many cases it could not be done owing to the construction of the spring forks, unless the brake shoe were fitted to the girder tubes instead of to the forks proper—an application which motor cycle engineers would certainly not regard favourably.

BOWDEN WIRE, LIMITED.

### Three-speed Hubs.

Sir,—It seems somewhat of a paradox that, just when the three-speed hub has proved its great reliability, there are makers who come along with new two-speed machines for next year. With the desire for a fairly high top gear and a very low bottom gear, the necessity for an intermediate gear should be obvious, as this middle gear removes the monotony of using the lowest gear too frequently. The present big demand for three-speed hubs suggests that next year will be a three-speed year.

Looking backwards, one recollects how the now universal three-speed hub for pedal cycles met with a lot of opposition in its early days, but, in spite of this, it quickly ousted the two-speeder. History appears to repeat itself in the case of the three-speed motor hub, as the old arguments are now trotted out by a few critics against this fitting.

The modern three-speed hub embodies the best type of gearing and the best type of clutch in a very neat form, and its weight is quite in proportion to the weight of the vehicle, and probably does not add as much weight (relatively speaking) to the motor cycle as does the three-speed hub to the pedal cycle.

As very few motor cycle manufacturers have the plant and experience necessary to make a gear as it should be made, it seems advisable to leave its manufacture to the firms who have specialised in this class of work for many years, and no doubt these firms will soon give us the perfected article—a strong, simple hub gear and clutch, smoothly and easily operated, of moderate weight, and almost everlasting wear, and as free from trouble as its pedal cycle prototype.

A point not to be overlooked is that the modern three-speed hub does not interfere with the simple and pleasing lines of a motor cycle, and machines so fitted present a much neater appearance than machines fitted with midway gear boxes, as the latter are invariably ugly.

H.U.B.

### Belt and Chain Transmission.

Sir,—In "Occasional Comments" "Ixion" seems hurt about the superiority of the chain over belt, as he is using the latter. I have preached for many a year with not the least success that the efficiency, *i.e.*, the power transmitted from one shaft to another by a belt, cannot exceed 60%, whereas the maintained efficiency of the chain drive is over 95%, but it must be borne in mind that the standard of accuracy necessary for a successful chain drive is very much higher than that which will do for a belt; this, doubtless, is the cause of many chain troubles, and the chief reason why manufacturers, particularly the assemblers, do not wish to be troubled with the alterations necessary for converting a bicycle from belt to chain drive. I have seen many a motor bicycle with the back wheel out of alignment for the purpose of preventing the belt mounting the pulley because the centres are different—this is fatal to the chain drive. The centres of the sprockets with a chain drive must be in the same plane, and it is only the very merits of the chain which lead to the thing being exposed to the dust and mud. "Ixion" grumbles that his particular chain drive had to be adjusted more than is necessary as a rule with a belt; this is absolute proof, in my opinion, that the chain was wrongly mounted, and though he may be extremely experienced in driving motor bicycles, his remarks that the threads of the

bolts were stripped and that the flimsy nuts were badly burred reflect, in my mind, adversely on the mechanic and not on the machine. For the benefit of your innumerable readers, I venture to make a few suggestions as to screw threads and nuts. The reason why nuts are burred generally is because a shifting spanner, not fitting the flats snugly, is used; nothing but a properly fitting set spanner should be used, particularly if the nuts are somewhat undersized for the work imposed upon them. Screw threads are chiefly stripped by carelessly or rather not squarely forcing down the nut, and the nut is frequently forced over a gritty or almost choked thread, with the result that both threads are spoilt. No two threads should be engaged unless they are scrupulously clean, and I think that bicycle makers must improve the cleanliness of their machines much further than they have already done, or they will be fostering the trade in well sprung, light four-wheeled cyclecars.

CYCARS.

Sir,—Your contributor, "Ixion," seems to have been unfortunate in his experience of chain-driven motor cycles, judging by his remarks in your issue of the 22nd ult. I have owned three chain-driven machines, and have never had any cause to regret my choice of drive, although the chains received very little attention in the way of oiling, etc., and were used in all weathers.

On my present machine I find it necessary to tighten the engine chains about every 1,000 miles and the driving chain about every 700 miles, riding with sidecar and passenger. Surely this is not an excessive amount, and the adjusting of all three chains is a very simple matter.

My experience of belt-driven machines is somewhat limited, but I have memories of being constantly employed shortening belts to prevent slipping on moderately steep hills when I owned a belt-driven machine, and I have often been amused when some member of the "knot" brigade has "sprinted" past me on the road, and whom I have overtaken further along repairing a broken belt—a sadder, but perhaps a wiser man.

A stoppage due to a broken chain I have never known, but should a link break it is not a difficult matter to repair it, provided one carries a few spare split links.

With regard to two chains sharing a common adjustment, while one must admit this is wrong theoretically, in practice it will be found of little importance.

I ought perhaps to say that my machines have been 1910, 1911, and 1912 models of the same make, and it is possible that the chain drive is better adapted to this particular machine than the majority of motor cycles.

I should not trouble you with this letter, but I feel it is only fair to give my experience of, at any rate, one make of machine with chain drive after "Ixion's" rather critical remarks.

A. E. LOE.

A. Batchelor, of Eassie, Glamis, with his 3 1/2 h.p. 1912 Triumph and Grosvenor double seated sidecar. The rider says that he has never stopped for want of power on any of the Perthshire or Forfarshire main roads, even with the full equipment of passengers.

Sir,—I see E. K. Wyatt is complaining of belt drive, so I think it only fair to put in a word for belts. I will take for example the return journey of my holidays from Helensburgh to Stony Stratford.

First day (166 miles). Helensburgh to Kendal (rain in Glasgow). No trouble.

Second day (260 miles). Kendal to Stony Stratford. Tightened belt a shade as it was raining. (I find it best to have the belt a shade tighter for wet weather.) Before I continued my return journey from Kendal I climbed two sides of Kirkstone Pass (Windermere and Ambleside), and although I was using a low gear and it was raining, the belt did not slip. I had rain for the first 100 miles. I was using a Stanley belt which had already done just over 1,200 miles. My machine is a  $3\frac{1}{2}$  h.p. Zenith, and I always reckon to get at least 2,500 miles out of a belt, so this works out at 6d. per 100 miles.

C. L. MOUBRAY.

Sir,—I was very interested by "C.P.A.'s" letter on belt speed in a recent issue, as it touches a point of design that I have always considered wrong in the belt and chain counter-shaft gear driven machine, which, by the way, is the drive I favour most. As "C.P.A." clearly shows, the belt is commonly run far too slow. I am therefore of the opinion that the belt drive should be from the engine to the counter-shaft, and chain from the counter-shaft to wheel; this would give the following advantages:

- (1.) A higher belt speed, making less strain on belt, absorbing more vibration, and giving a longer life.
- (2.) Retaining the use of an adjustable pulley, which could be at least 6in. diameter to ensure plenty of grip.
- (3.) A softened drive to the gears.
- (4.) The belt would be less apt to get wet, as it would be further from the splashes made by the back wheel, and it would have the drying effect of the warm engine pulley.

I would like to hear if any makers have tried this style of drive, and if so, with what results.

J. DUNCAN.

### Rotary Engines.

Sir,—On reading the last number of *The Motor Cycle* I noted with much interest that experimental rotary-engined motor cycles are on test. It is, I believe, claimed that greater efficiency and horse-power can be obtained from them than from the stationary type, weight for weight. I think it extremely unlikely, however, that the rotary engine will be an improvement on the ordinary type; in fact, it will probably prove to be very inferior, both as regards reliability and fuel consumption. The trend of aeroplane designs is to do away with the rotary engine and replace it with the ordinary vertical type. One may safely say that the rotary engine has had its day, and any attempt to incorporate it in the motor cycle must certainly spell disaster.

VERTICAL.

Sir,—With regard to rotary motors, our knowledge of this type of motor is almost entirely confined to the Gnome aeroplane motor. Given constant attention and frequent disembowelling, the engine has given aviators what they wanted, i.e., sufficient power for cert in limited periods, and, without doubt, aviation owes a debt of gratitude to the makers.

The advantages of the rotary engine are (1) even torque, (2) lightness, and (3) easy cooling, but this latter usually takes place on one side of the cylinder more than on the other, hence liability to distortion, unless special precautions are taken in the design. Against these advantages must be set (1) short life and (2) lubrication difficulties. The rotary engine is very extravagant in oil (most of which is flung out with the exhaust), and feeding it in with the fuel does not sound an inviting proposition. (3) Inefficiency. No Gnome comes up to its R.A.C. rating, even though a higher compression engine might be more efficient. (4.) The high speed rotary engine is a very real danger, and, apart from the risks of internal rupture, gyroscopic action seems, from aviation experience, to be a very doubtful blessing. Immunity from sideslip can be gained in other ways.

In aviation, the rotary type has "just suited" for a while, but for safety, reliability, and fuel efficiency there are better engines, and before long it will doubtless go. In view of its inherent disadvantages. I doubt its capacity to succeed in the motor cycle.

G.M.P.

Sir,—Gyroscopic reactions are not the simplest phenomena we know, although they may be briefly stated thus. When the axle of a rotating body is twisted the body resists the twist strongly, and as strongly tends to twist the axle at right angles to the direction in which the applied force is trying to twist it.

To get a clear idea of the reason of this, suppose a flywheel rotating slowly about a vertical axis so that to one looking down on it it is rotating clockwise. Now I pull the top end of the axle south and push the bottom end north. In doing so I give the northward portion of the rim an upward motion and the southward portion a downward motion. But the flywheel rotating carries these portions with their respective upward and downward momentums round, and after a quarter of a turn of the flywheel we find that the east side has an upward momentum and the west side a downward one. The axle accordingly tends to tilt, the top to the west, the bottom to the east, i.e., at right angles to the direction in which I was trying to tilt it.

Applying this reasoning to a bicycle, we see that the gyroscopic effect of the flywheels is to resist twisting the cycle round a corner, and when in spite of it the cycle is twisted, to react in the direction of twisting the tyres out below the rider.

This does not apply to engines mounted across the machine as in the 2½-3 F.N. There the reacting twist is fore and aft.

A simple way to prevent gyroscopic effect is to have two flywheels parallel to each other rotating in opposite directions. This is practically accomplished in the engine described in last week's issue, which should (unlike the ordinary engines) have absolutely no external gyroscopic effect.

This principle has been suggested to prevent gyroscopic effect in aeroplanes, e.g., by employing two Gnome engines rotating in opposite directions. Of course, in the framework between the two engines severe stresses might be set up by the counterbalancing gyroscopic forces; indeed, it may be remembered that such strains were suggested as possible causes for the unknown disaster which overtook the high speed turbine destroyer *Cobra*.

N. S. MAIN.

### Sidecars and Safety.

Sir,—Referring to your remarks in your last issue regarding the recent sidecar fatality, and your recommendation for an additional attachment being fitted as per your sketch.

In my opinion the extra tube you recommend is quite unnecessary, and I feel certain that, if it were possible to prove it, it would be found that sidecars with four-point attachments are more liable to break than properly designed sidecars with three-point attachments.

In connection with the enquiry into the circumstances attending the sad accident in which Mr. Power met his death a fortnight ago, I was consulted by the solicitor engaged in the case to give an independent expert opinion as to the cause of the accident, and therefore made an examination of the motor cycle and sidecar. I found the sidecar was one of the four point attachment variety, having two attachments at the front, somewhat similar to those shown in your illustration, and the axle tube was cranked with the object of having the sidecar wheel in line with the driving wheel.

"THE CHAR-OT," a specially strengthened sidecar frame, designed for a low body position. The maker's name is withheld, as the article will not be ready for the market till November.

All four attachments to the motor cycle were sound, but the tube running parallel with the bicycle had broken close up to the T lug which carried the forward cross member of the frame.

I have no doubt that the breakage was due in a great measure to unequal distribution of weight, but in my opinion the extra attachment had hastened matters and caused a breakage to what would otherwise have been a bent tube.

At the inquest on the 7th inst., Mr. Alex Craig, M.I.C.E., was called by the authorities to give expert evidence, and he stated that the tube had become crystallised through vibration, and I take it that sidecarists generally will require to know that all sidecars are not open to this dread possibility, and will welcome an explanation of its prevention.

It is tolerably well known that the sidecar is "theoretically" wrong in its conception; but, in spite of this, it has been developed on absolutely safe lines by trial and elimination of error, therefore the margin of design for safety is perhaps narrower in this than in any other vehicle on the road.

It is not possible to produce a perfectly rigid sidecar frame, and the ill-considered tendency for bringing the wheel further back to be level with the driving wheel, and at the same time pushing the body forward so as to bring the passenger on to a level with the driver, throws too much weight on the unsupported part of the frame, and weakens it considerably.

The extra attachment at the front is introduced to strengthen the frame, but in practice it only stiffens the side tube and destroys its elasticity. The effect of this is to confine the vibration to a short length of tube, which eventually will break in its weakest point, i.e., the nearest brazed joint.

There are other important considerations, such as the special quality of tube required for the maximum of strength, the attachments of the springs, balance of weight carried, etc., which have been tested and proved by many thousand miles riding over all sorts and conditions of roads in public competition and private touring.

The conclusion is that, provided the sidecar is properly made, it can be used with full confidence and certainty of excellent service.

W. MONTGOMERY.

#### Transmissions.

Sir,—The experience of motor cyclists writing under the above heading is so contrary to my own that, in justice to the company manufacturing the belt and tyres fitted to my machine, I gratefully record my experience.

I have driven a 5.6 h.p. twin two-speed Bat sidecar combination with a 1in. x 9ft. Dunlop belt 2,200 miles. The belt has been shortened twice only, is still almost as good as new, and looks good for double the mileage it has already done. On the driving wheel is fitted a Dunlop 650 x 65 light car grooved tyre, which has run 1,700 miles, has never been punctured, and the tread has worn only to the extent one might reasonably expect. Further, I would add that my runs have been mostly over very hilly country (Cornwall) with a surface not above the best. F. C. POLGLASE.

#### The Braking Effect of Compression.

Sir,—In answer to Mr. West's letter appearing in *The Motor Cycle* recently, I should like to say that I quite agree with him regarding what he says about the braking effect of compression, and that it has none. But this is only a term used, the braking effect is really got from port friction; the piston on the induction stroke induces the charge under a partial vacuum, therefore the pressure under the piston is greater than on top, and the piston, coming down on that pressure, retards the free motion of the engine. Precisely the opposite occurs on the exhaust stroke; the piston is then going up the cylinder with a positive pressure forcing the charge out; this also has the effect of retarding the rotation. If it were not for these forces, the speed and power of an engine would be unlimited, assuming the mechanical parts could be made to stand the strains.

HENRY GRAFTON.

#### SUMMARY OF CORRESPONDENCE.

Mr. S. R. Ashford writes that he was not disqualified in Class III. of the Streatham hill-climb, but that somehow, thinking that Class III. was the racing class, he stripped his machine, and, on finding out his mistake, did not ride.

The Bosch Magneto Co., Ltd. write that the trouble experienced with magnetos in the Six Days' Trials were in every case caused by mud and water being allowed to get on the high tension cable and run down to the socket in which the cable fits. This cable end, not being fitted with wax according to instructions, gradually permitted an accumulation of conducting material which ultimately caused a short circuit. A Bosch magneto ran during the whole of the Olympia Show with water pouring over it.

F. W. Roberts writes that at the Leeds and Sheffield and Hallamshire M.C.C. speed trials he tied with J. Haslam and beat him in the return. Both rode 6 h.p. Zeniths.

Several letters are awaiting Mr. W. A. Hallsworth, the inventor of the hand-starting device for four-cylinder F.N. motor cycle engines illustrated on page 1003 in *The Motor Cycle* of September 5th. Will he kindly send his full postal address to the Editor?

Will the motor cyclist who borrowed a Lodge plug near Watford communicate with the lender Mr. H. A. Freeman, Leves Villa, St. John's Road, Watford?

A letter addressed to R. Marley, 30, Woburn Place, W.C., has been sent back to us through the returned letter office. If the correspondent will forward his correct address the reply to his query will be sent to him.

THE NEW 10 h.p. FOUR-CYLINDER SINGER CYCLECAR.

Side view of the new Singer showing its clean lines and Sankey detachable wheels.

Front view from which will be noticed the ample width mudguards with inside extensions.

The *Motor Cycle* representative at the wheel drove the machine on one of its first trials, and will shortly give it an extended test.

THE weather was fine and cool with little or no wind for the postponed 150 miles race of the British Motor Cycle Racing Club, held last Saturday. Great interest has been taken in the event by reason of the fact that it was almost a Tourist Trophy reunion, the entry list being a representative one of fifty-six runners, twenty-five of that number being in the Junior Race. Unfortunately, the non-starters were rather numerous, only fifteen actually answering to the call of names in the first event, which was started at 11 a.m.—much earlier than advertised—and which accounts for the small sprinkling of spectators when Major Lindsay Lloyd gave the signal to start.

#### The Junior Race, 150 Miles.

The starters in this event were as under—

Rider and machine.	c.c.
J. T. Bashall (2 cyl. Douglas) ... ..	350
A. B. T. Bashall (2 cyl. Douglas) ... ..	350
F. A. McNab (2 cyl. Douglas) ... ..	350
S. L. Bailey (2 cyl. Douglas) ... ..	350
V. Wilberforce (2 cyl. Douglas) ... ..	350
A. E. Woodman (2 cyl. Humber) ... ..	345
S. W. Phillpot (2 cyl. Humber) ... ..	345
Sam Wright (2 cyl. Humber) ... ..	345
Hugh Mason (2 cyl. Nut-Jap.) ... ..	350
W. A. Jacobs (1 cyl. Singer) ... ..	299
H. V. Colver (2 cyl. Enfield) ... ..	348
F. G. Edmond (2 cyl. Humber) ... ..	340
H. C. Newman (1 cyl. Ivy-Precision) ... ..	346
A. J. Jenkins (2 cyl. Douglas) ... ..	350
P. W. Owen (2 cyl. Forward) ... ..	344

Of the machines, perhaps the most interesting was Colver's new model Enfield with a new engine of the company's own make. It has overhead inlet valves, forced lubrication, and a magneto in the tank. It has great promise. Newman used

the Brampton gear, as he found it greatly assisted him by "reviving" the engine when a low ratio was employed for a few seconds. J. T. Bashall rode his brother's Junior T.T. winner. Jenkins rode a Douglas in full touring trim, and had, in fact, ridden it down from Liverpool the day previous. Owen's red Forward was conspicuous for its big petrol tank. The Douglas and Humber teams promised a keen struggle, and so it proved.

#### The Race Described.

At the start Bashall and Bailey shot ahead on their two-speeders, and after passing the members' bridge the riders had already formed a long procession, showing how some men gain a substantial lead right away. At the end of the first lap Bailey was in front, closely followed by Edmond and Woodman, Newman on the single-cylinder being in close attendance. Edmond's engine commenced misfiring, and on the next round Wright had gained second place. Edmond was fourth, J. T. Bashall fifth, and Newman sixth. As time progressed, it was seen that the two favourites, Bailey (Douglas) and Wright (Humber), were always in sight of one another and often following one another's back wheels.

The Nut-Jap, which had started indifferently with Mason, its rider, tinkering with the carburetter as he sped along, was noticeably improving every lap and began to overhaul the leaders. On the sixth lap Wright gained the lead with Bailey close behind and the third man (Woodman) a long way off. J. T. Bashall was fourth and Newman fifth. Wilberforce was one of the earliest to stop for replenishments. Wright led until the tenth lap, though both he and Bailey were obviously keeping their machines well in hand, which was natural in view of the strenuous nature of the test. They were lapping at about 55 m.p.h., though both can maintain over 60 m.p.h. when they desire it. Mason was now fourth, with Woodman still going consistently.

V. Wilberforce (2½ Douglas) in the Brooklands Junior T.T. Race passing the competitors lined up for the Senior event

## Junior and Senior T.T. Races at Brooklands.—

## A Steady Trio.

Competitors to attract special notice were Owen, Phillpot, and Jenkins, who had apparently adopted a set speed of about 48 m.p.h., and nothing would tempt them to go faster. The sight of others speeding past at over 50 m.p.h. did not concern them. Colver stopped to clean a plug, McNab rode on a flat back tyre. On the twelfth lap Bailey had gained a useful lead over Wright, but both these riders were nearly a lap ahead of the rest of the field. Colver withdrew his Enfield owing to a broken exhaust valve, his

Scene at the replenishment depot. S. L. Bailey changing the belt on his Douglas. He ultimately won the Junior event from a big field.

spare being too long, and misfortune also befell Newman, his valve rocker breaking when he was among the first half dozen.

At the end of the first hour Bailey still led, the distance credited to him being fifty-two miles three yards. He at once stopped, replenished his tanks, and changed a belt. McNab blew off another tyre, so this time fitted a new wheel from "Bizzy" Bashall's machine which had been withdrawn in the seventh lap with engine trouble. Mason, with his overhead valve Nut-Jap, had now crept up to second place, which position he was destined to hold almost to the finish. Audrey Bashall came into control on a flat tyre, which had blown off the rim and almost thrown him. Jacobs was delayed owing to a lengthened valve. Wright unfortunately blew off his rear cylinder, so Bailey was left without a rival, Mason having lost time at the start.

Bailey and Mason clung together for several laps, though Bailey had completed forty-two laps when Mason had thirty-nine to his credit, the next in order of merit at this point being: Wilberforce (33 laps), Woodman and A. B. Bashall (32 laps), Jenkins (31), Phillpot (29), Owen and Edmond (28), and McNab (26). These were the only ten left in the running.

The number was reduced by Audrey Bashall's retirement, due to a leaking tank, and Edmond who was the victim of hard luck. A stone got in the belt rim, threw the belt off, and jammed the back wheel, with the result that the rider ran into the bank, but luckily sustained no injury.

## Tyre Troubles on the Track.

More tyre trouble befell Jenkins. Bailey's Douglas continued to run most consistently, the engine emitting a roar resembling a rotary aero engine. He finished a winner by two complete laps in the record time of 2h. 49m. 45s. Being informed that the three-hours record was within his reach, he hastily refilled and was off again, and succeeded in capturing this record also. Mason, as was expected, came in an easy second, and six were left to fight out the third

position, viz., Woodman, Jenkins, Phillpot, McNab, Wilberforce, and Owen. Interest had waned as they were so far behind. The last-mentioned had two cases of tyre trouble, so retired, and, despite a delay in changing a valve, Woodman, the popular one-legged rider, finished third, six minutes ahead of Jenkins.

The times for the 150 miles are:

			h.	m.	s.
1.	S. L. Bailey	(2½ Douglas)	...	...	2 49 45
2.	Hugh Mason	(2½ Nut-Jap)	...	...	3 0 35
	A. E. Woodman	(2½ Humber)	...	...	3 50 21
	A. J. Jenkins	(2½ Douglas)	...	...	3 56 5
	F. A. McNab	(2½ Douglas)	...	...	...

## The Senior Race.

The stragglers in the Junior event were so long finishing that a start had to be made with the Senior Race. By this time the spectators had greatly increased in numbers, and, with a field of twenty-six starters on faster machines, the interest was great. It was a sight to be remembered when Mr. Loughborough dropped the flag, all getting away smartly, though S. R. Axford unfortunately collided with another competitor in mounting, and his machine was thrown to the ground, breaking the oil pump and causing other minor damages.

## The Senior T.T. Competitors.

The starters and their machines were:

			c.c.
J. R. Haswell	(Triumph)	...	499
S. D. Timson	(Rudge)	...	499
C. R. Martin	(Triumph)	...	499
F. K. Portway	(Triumph)	...	499
S. Russell Cooke	(Rudge)	...	499
Stanhope Spencer	(Rudge)	...	499
W. H. Elee	(Rudge)	...	499
A. G. Miller	(Premier)	...	499
E. B. Ware	(Zenith)	...	498
H. Huckle	(Zenith)	...	498
P. Weatherill	(Zenith)	...	495
V. E. Horsman	(Singer)	...	499
J. L. E. Emerson	(Norton)	...	490
P. Brewster	(Norton)	...	490
S. F. Garrett	(Green-Precision)	...	499
H. C. Mills	(Green-Precision)	...	499
J. W. Woodhouse	(Regal-Precision)	...	499
S. R. Axford	(Martin-Jap)	...	494
C. R. Collier	(Matchless)	...	498
H. Cork	(Matchless)	...	498
W. Howard	(Matchless)	...	498
A. N. Tooney	(Matchless)	...	498
T. A. Carter	(Martin-Jap)	...	498
L. Hill	(Rudge)	...	499
F. Bateman	(Rudge)	...	499
O. C. Godfrey	(Indian)	...	498

L. Hill led on the first time round with Emerson, on the long-stroke Norton, close behind. Great things were expected

Hugh Mason (2½ h.p. Nut-Jap), who finished second in the Junior Race.

### Junior and Senior T.T. Races at Brooklands.—

of the last mentioned rider, for several Brooklands *habitués* told us that he had lapped during the week regularly at 68 m.p.h. S. F. Garrett (Green-Precision) was next, P. Brewster fourth, and H. Petty fifth. In the second lap Garrett dropped back owing to the loss of his oil filler cap; O. C. Godfrey and C. R. Collier crept up several places, and next came Woodhouse, Petty, Haswell, Martin, and Horsman.

### The Leaders Unchanged.

Up till the tenth lap the positions of the two leaders were unchanged. Hill and Emerson had set up a crackling pace, completing lap after lap in 2m. 28s. (66.11 m.p.h.) as regularly as clockwork. But would the pace last? Emerson gained the lead on the eleventh lap, Hill being next, T. A. Carter third, and Brewster fourth.

Emerson showed no signs of relaxing his pace and gradually drew ahead until on the fourteenth lap he was half a minute in front. In the fifteenth lap Hill was seen to have dropped out, leaving a still bigger gap between the leader, Emerson, and the next man, C. R. Collier. In this round there was a general shuffling of positions, Weatherilt gaining third place, Ware fourth, Godfrey fifth, Haswell sixth, Martin seventh, and Carter eighth. Several now stopped for replenishments, including Emerson, which caused his supporters disappointment as he was inside record and had a chance of the hour record if he had kept going. J. Mills retired with a seized engine (his radiator was seen to be leaking), and Garrett's pulley came off.

On the eighteenth lap Weatherilt was second, Collier third, and Haswell fourth. The last named had damaged his standard engine the day previously and decided to use the experimental Triumph engine with overhead inlet valve. It had been ridden down by road, but it was going great guns on the track, and, in fact, carried Haswell without a stop or trouble of any kind. Weatherilt dropped back owing to a stop for petrol, and at the twentieth lap the positions were: Emerson, Collier, Carter, Haswell, Godfrey, the two last named hanging together as is their wont when competing in track races.

Huckle, who had been going extremely well, dropped out owing to a broken valve lifter rocker, and Brewster also had engine trouble. Ware and Collier now made another pair to fight out a duel of their own, and together were second and third at the end of the first hour, Emerson, of course, still leading with over sixty-three miles to his credit. Martin, who was using Haswell's old record-breaking Triumph engine, had to change a valve. Woodhouse retired with a seized engine.

After one and a half hour's riding Emerson had completed apparently thirty-five and a half laps, and was two and a half laps ahead of the field—something like a convincing lead. Of course, every one was asking who was Emerson, whose Norton

A racing Triumph, with overhead inlet valve, ridden by J. R. Haswell at Brooklands on Saturday last. It is unlikely that it will be supplied to the public for some time.

was shining so conspicuously. He is a native of Hull. Carter, though travelling magnificently, sits his machine peculiarly, swaying his body about all the time. When Godfrey stopped for oil naturally W. H. Wells was there with the big syringe. F. A. Applebee looked after the petrol, and the rider was off again before one could realise he had stopped at all.

### An Unmistakable Winner.

As the fifty-sixth lap drew nearer it was regarded as a foregone conclusion for Emerson and his wonderful Norton which had run regularly throughout. There was hardly any variation in his lap times, and the exhaust continued to be as crisp as ever. Finishing an easy winner, and capturing three world's records on the way, he continued for the three hours' record, but had perforce to give up owing to tyre trouble.

Weatherilt was second in order, but, nearing the end of the 150 miles, his oil tank burst and poured oil over the engine and belt causing the latter to slip. He made a gallant attempt to finish, knowing that Haswell was only half a lap behind, but the Triumph rider never slackened a tick, and he came in a good second, Godfrey also passing the Zenith rider on his last lap. Ware was fifth, Carter sixth, and Elce seventh, these being the only competitors allowed to finish.

The official times of the survivors are given hereunder:

		h. m. s.

	W. H. Elce (3½ Rudge) ...	2 50 6

### Details of Records.

In the Junior Race S. L. Bailey (Douglas) annexed the 150 miles record, time 2h. 49m. 45s., and covered 159 miles 990 yards in three hours, also a record in Class B.

In the Senior Race J. L. Emerson (3½ Norton), besides covering the 150 miles in record time (2h. 20m. 52s.), covered the 100 miles in 1h. 33m. 25½s., and in two hours traversed 127 miles 645 yards—all new Class C records.

S. L. Bailey (2½ h.p. Douglas), winner of the Junior Race, shaking hands with W. W. Douglas.

## A CHANNEL STEEL SIDECAR FRAME.

A channel steel framed sidecar made by the Gosford Engineering Co., Coventry, and described on this page. The inset shows the method of springing the rear portion.

We recently had brought to our notice a sidecar frame made on novel lines by its designer, Mr. W. E. Boyes, of the Gosford Engineering Co., Coventry.

The frame, which is attached to the motor cycle at the usual three points, viz., front down tube, seat tube, and chain stays, is made of channel steel. The body, which is made by the Bramble Mfg. Co., as will be seen, is suspended on two threequarter elliptical springs at the rear, and the front portion on one semi-elliptical spring set transversely to the frame.

The present type of body is, we understand, only experimental, as in future the front portion will have an upward curve, so that if at any time the front stay of the sidecar should come loose or break, the makers claim that the sidecar will skid along the ground until the engine may be stopped.

One of the features of the frame is that there are no brazed joints or castings on any part of it. Another point worthy of note in the manufacture of the sidecar is its weight, and we are told that the complete machine without body scales exactly 48 lbs. Although being slightly under the average weight of this type of vehicle, it is of sound construction, and well made throughout.

## A Double Clinch Cover.

The Coventry Rubber Co., who are the manufacturers of the Three Spires non-skid tyre, have just introduced a new cover which they call a Double Clinch tyre. As will be seen on examination of the annexed illustration, which is that of a section of the cover, the walls close to the bead have been thickened so that when the tyre is compressed in use the opening and shutting action, which takes place usually right against the bead, is transferred to a point well above it and about the middle of the side of the cover. The base of the thickened rubber wall rests on the edge of the bead of the rim, thus

strengthening and supporting the weakest part of the cover. Motor cyclists know that there has been a considerable amount of dissatisfaction this year with some motor cycle covers owing to the way in

The Double Clinch—a new Three Spires tyre.

which they have given way at the beads. Mr. J. Jelly, the manager of the company, and patentee of this device, informs us that among the advantages of this new tyre are that creeping is prevented owing to the edge of the rim being gripped between the bead and the buttress. A perfect seal takes place between the rim and the buttress, making it impossible for water to get in at this point. Anti-skidding qualities are enhanced owing to

the tyre being always in a direct line between the wall and road. It is quite remarkable how the tyre stands up when pressure is applied to it, a partially inflated tyre being as rigid laterally as a fully inflated one of the ordinary type. The Double Clinch tyre is provided with a

The Hazlewood front fork end, showing the mudguard stay and front wheel stand fittings.

non-skidding tread which is formed of two ridges moulded in such a position that the non-slipping parts are not worn down level with the cover before the tyre is worn out, thus making it equal to a plain tyre, but the anti-skidding parts are on the edges, where no wear takes place. This is a point often overlooked in tyre construction, and one worthy of the attention of readers. From an examination of the tyre we think that Mr. Jelly has a distinctly good thing in the Double Clinch tyre, but, of course, it is impossible to predict definitely its success or otherwise without a trial of a machine fitted with the tyre. There is, however, no reason why it should not be as fast or faster than an ordinary one, and if it transfers the bending stress to some other portion of the cover than the weak portion of the beaded edge, that alone justifies its existence.

## The 3 h.p. Twin Hazlewood.

Hazlewoods, Ltd., of West Orchard, Coventry, have for some time past been thoroughly testing a new 3 h.p. twin-cylinder model, and are now delivering it in considerable quantities. One day last week we were invited to inspect a batch of four which were being sent to South Africa. The machine resembles the well-known 2½ h.p. model in most respects, but is fitted with a twin-cylinder J.A.P. engine of 60 mm. bore and 76 mm. stroke. The frame has been considerably strengthened, and the "Mark V." Armstrong three-speed hub for 6 h.p. machines is employed. There are several detail improvements on the new model.

Valve side of the new 3 h.p. twin-cylinder Hazlewood.

For instance, the footrests are mounted separately from the clutch pedal bracket; all control rods are quite straight; pedals are fitted, as the new Armstrong gear is capable of being started with the wheel

on the ground; a neat front wheel stand is now embodied with the front forks, and the mudguard stays are mounted on separate bushes on the fork-ends and merely held in position by set-pins. The

finish of the whole machine is carried out in the usual Hazlewood black and brown, and has a very neat appearance. On Hazlewood machines all nuts are either split-pinned or lock-nutted.

## NOVEL ROTARY ENGINE.

A novel rotary engine for motor cycles, invented by a well-known motor cyclist.

**A**N interesting engine has lately been completed which is the invention of G. T. Gray, a well-known Rudge rider. The cylinder consists of a circular endless tube in which four pistons *L* travel continuously in one direction. These are joined through a slot in the cylinder to arms which cross each other at the centre and work scissor fashion. Thus the space between any two adjacent pistons can be made to vary in size, which space forms the combustion chamber.

These spaces are caused to vary in size by connecting the four arms to four planet pinions by means of short connecting rods, so that as the planet pinions revolve they cause the arms and pistons to be alternately drawn together and moved apart. The pinions mesh with a sun wheel keyed

to the engine casing, and are carried on a cage *T* keyed to the main shaft.

It must be understood that as the four pistons travel round the cylinder in the same direction they alternately approach and depart from each other.

The operations of the four cycles in this engine are as follows: The port cut in the cylinder wall at *C* is the induction port. The timing of the planet pinions is so arranged that when any two of the pistons come opposite this port they shall be closest together. While they are passing it the forward one will accelerate, thus enlarging the space between them and drawing in gas. When just past the port the following piston will accelerate. The space between them will close up and compress the gas until they are closest together, which occurs at the dead centre

of the connecting rods. At this position the sparking plug *D*, which is fitted in the cylinder, will fire the gas. The power of the explosion will force the two pistons apart, although both continue to travel in the same direction.

When the pistons have been forced apart to their fullest extent they will have travelled round the cylinder to a position opposite the exhaust port *B*. While they pass this port the following piston will accelerate and push out the exhaust gas. This completes the cycle of operations.

As these operations take place between each of the four pistons in turn, there are four explosions per revolution, all taking place at one point in the cylinder, namely, where the sparking plug is fixed. It will be noticed that the piston does not uncover the plug until the gas is fully compressed so that a timed spark is not necessary.

A two-speed gear is provided by means of an internally toothed ring meshing with the planet pinions. Lubrication is provided by centrifugal force.

An outside flywheel can be fitted if required, but would not be necessary for speed work owing to perfect natural balance, total absence of reciprocating parts, and almost constant torque.

For certain purposes, cyclecars for instance, two or more complete engines could be coupled on to one shaft, the resulting motor being very compact, and the torque almost equal to that of an electric motor.

The design readily adapts itself to water cooling if necessary. Mr. Gray is anxious to dispose of the patents, and letters may be addressed to him c/o the Editor.

## THE RECORD-BREAKING NORTON— A NEW CARBURETTER.

The Norton motor cycle so successfully ridden by Mr. Emerson on Saturday last was supplied as a standard machine. On careful inspection after the race, we could find nothing about the engine that was not standard, except for strong valve springs. Piston, connecting rod, cams, etc., are all as usual. Those who favour the long stroke will be interested to know that the usual Norton sizes of 79 mm. bore and 100 mm. stroke were used. Mr. Emerson's lap times steadily improved, and the lap previous to the tyre trouble he completed at the speed of 67.94 m.p.h. This speed with the gear used equals 3,022 r.p.m., and a piston speed of 3,380 feet per minute.

The Amac Co., Aston, Birmingham, have decided to market a single lever carburetter which, after prolonged tests, has given excellent results. Outwardly it resembles the standard two lever type except for the absence of one control. It will have six small jets arranged as usual with one main control jet. The single barrel is operated in the usual manner, forming a combined throttle, choke tube, and air lever.

## HILL-CLIMB AT AMULREE.

Competitors weighing in previous to the start of the hill-climb on Amulree last Monday.

THE Edinburgh M.C.C. held their annual hill-climb on this now famous hill. The bad weather which had prevailed had somewhat lessened the number of entries, but despite this they totalled forty-five. A noteworthy entry was the twin Indian ridden by Oswald G. Braid. It was the identical machine ridden in the 1911 T.T. Race by J. R. Alexander, when it had a capacity of 570 c.c., but when Alexander rode it (as he did) in the 1912 T.T. Race he had shortened the stroke and reduced the capacity to 496 c.c.

Another interesting machine entered was A. H. Alexander's 2½ Douglas with sidecar, in which he had the previous day successfully taken a passenger up the hill, and certainly in the lightweight class, as a solo machine, he played with the corners and made a fast ascent. The timing was electrical and automatic, each competitor breaking a thread which started a stop watch at both ends and breaking another at the finish that stopped both watches. Just at first it gave some trouble, one of the watches refusing to start, but this was soon put right.

Last year the starting point had been at the foot of the hill, and at the start competitors had to cross a bridge at right angles to the road. This, combined with the rough surface, caused the officials to look upon it as too dangerous,

and as a result the starting point was moved about 400 yards up the hill. The corners this year were rougher than last year, and did not appear to have been swept, but the second corner had been slightly more banked, which made it a bit better.

The start was timed for 1 p.m., but the first man did not get away till after half past, and this slight delay just prevented us seeing the last two events, the stopping and starting test and the sidecar class. The classes were eight in number, and were as follow:

Class I.—Novices (abandoned).

Class II.—Lightweights under 350 c.c. (handicap).

Class III.—Single-cylinder (handicap).

Class IV.—Twin-cylinder (handicap, abandoned).

Class V.—Scratch race, single or twin under 550 c.c.

Class VI.—Scratch race, single or twin under 1,000 c.c.

Class VII.—Stopping and starting test. Machines to be stopped after passing a line, wheeled back behind the line, and re-started again (a very good arrangement).

Class VIII.—Passenger machines (handicap).

The first man off in the lightweight class was McGregor (Douglas), but he stopped on the corner. He was followed by A. H. Alexander (Douglas), who made a fine ascent. A. U. R. Downe (2½ A.J.S.) fell, but restarted and finished. As the electrical timing "went on strike" just then he had to have another try and succeeded in making a clean ascent—lucky for him.

## Class III.

In Class III. all got round the bends without falling, but A. J. C. Lindsay had to dismount at the second bend and run alongside, while Oswald Braid (3½ twin Indian) stopped on the bend.

J. R. Alexander was to have ridden his 7 Indian in the passenger class, but had to content himself with the solo scratch class, as he had broken the low gear. He had some doubts about his possible success on the corners solo, but he managed to get round all right.

Taken all round, the event was a most successful one, the weather, which, till a few days previous, had been wet, decided to change and turned out gloriously fine for the weekend. A head wind did not help the competitors, but it was nothing like the half gale that blew during the same event last year. There is still a dangerous ridge just past the second corner that throws machine and rider off the ground, but otherwise, with a little sweeping, the road is not so bad, except at very high speed, when it becomes dangerous.

The results were not obtainable when we left, as no arrangements were made to work out the results on the spot. A proper list of entries was not available owing to late entries, but among many others might be named the brothers A. H. and J. R. Alexander, the brothers MacMillan on their Scott machines, and McGregor on his 2½ Douglas.

Breaking the tape at the start. The ends can be seen each side of the rider.

A rider of a 7 h.p. Indian, taking the first bad bend on Amulree.

## Torbay and District Open Hill-climb.

**L**AST Saturday the solitude of Halshanger, Dartmoor, was rudely broken by the crackle of many and various exhausts. One hundred and four entries were received for the above event. The weather was all one could wish, the organisation good, and nearly all the entrants faced the starter. The Brooklands postponed race prevented many more men from coming, but the committee regard over a hundred entries as very satisfactory, it being the largest gathering for an open climb held in the West. The hill in places had been washed out by the recent rains, but presented no difficulties on that score, and justified its description as a safe course, the event not being marred by the slightest mishap. There were the usual stops occasionally for traffic. A field was hired at the foot of the hill, and the weighing performed under a large oak. The hill is of rather a deceptive nature, being steeper than it appears to be, gradually approaching a hump half-way up. There is another smaller hump at the foot, over which many of the front wheels jumped yards. Timing was successfully carried out by telephone, a tent being erected at the top of the hill for the timekeepers and instrument. Times were thus known immediately a man passed the tape, and Mr. Coombs was busy working out the formulæ from the commencement, the whole being known very shortly after, except the team results, which will be known later. The men were despatched rather slowly at first, but afterwards went up at intervals of thirty seconds. G. Griffiths, on an 8 h.p. Zenith, secured fastest time of the day in 47s., G. Clarke obtaining the same honour for the singles in 49½s. F. Ball, on his Douglas, made a brilliant ascent in the excellent time of 56½s. R. Holloway only rode his 2½ h.p. Premier, but made good time, winning on formula. Miss May Walker rode in three classes, winning the ladies' class both on time and formula.

A large number of visiting motor cyclists and others were lining the route. The A.A. scouts gave assistance in marshalling the course, and the whole day was made a picnic by many local people. Cinematograph films were taken by Gaumont, to be shown at the Torquay Electric Theatre.

Unfortunately for the secretary, who was acting as starter, the principal members of the club are keen riders, and some were competing in five classes. This reduced the number of helpers somewhat, otherwise everything went well. The Triumph silver medal was won by R. W. Williamson for the best single-cylinder time in the unlimited club event. The Humber silver cup was won by A. Powell for the best lightweight performance.

### RESULTS ON TIME.

Open Lightweight Class.	Passenger Class.
F. Ball (Douglas) ... 56.5	G. Griffiths (8 Zenith sc.) ... 61.4
J. Dudley (Hobart) ... 63.2	500 c.c. Variably-gear'd Touring Machines.
A. Powell (Enfield) ... 68.4	R. Broadbear (Premier) 53.0
Club Lightweight.	V. Taylor (Rudge) ... 55.0
A. Powell (Enfield) ... 66.4	S. Crawley (Triumph) ... 56.0
W. P. Harding (Douglas) ... 70.0	500 c.c. Fixed Gears.
H. Benny (Enfield) ... 73.0	S. Crawley (Triumph) ... 52.0
Unlimited Racers.	R. Broadbear (Premier) 53.8
G. Griffiths (8 Zenith) ... 47.0	V. Taylor (Rudge) ... 55.2
G. Clarke (Rudge) ... 51.2	Ladies' Class.
R. Williamson (Norton) 52.4	Miss M. Walker (Douglas) 65.0
Club Event—All Comers.	Mrs. Tucker (Premier) ... 70.8
R. Williamson (Norton) 51.4	Mrs. Simpson (Rudge) ... 73.0
E. J. Hancock (3½ Premier) ... 58.2	500 c.c. Racers.
W. Chenoweth (3 Jap) 59.6	G. Clarke (Rudge) ... 49.6
	R. W. Williamson ... 51.0
	R. Broadbear ... 54.0

**RESULTS ON FORMULA.**—Event 1: 1, R. Holloway (Premier); 2, J. Dudley; 3, F. Ball. Event 2: 1, J. Dudley; 2, V. Taylor; 3, W. E. Rootes (Singer). Event 3: 1, A. Powell; 2, H. P. Overmers (Douglas); 3, W. P. Harding. Event 4: 1, W. E. Rootes; 2, V. Taylor; 3, J. Dudley. Event 6: 1, Miss May Walker; 2, Mrs. Simpson; 3, Mrs. Tucker. Event 7: 1, R. W. Williamson; 2, W. Chenoweth (Jap); 3, A. Powell. Event 9: 1, W. E. Phillips (Triumph).

HILL CLIMBING ON DARTMOOR. Incidents in connection with the open hill climb at Halshanger, organised by the Torbay and District M.C.C.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

Sept. 19th	...	7.5	p.m.
" 21st	...	7.0	"
" 23rd	...	6.56	"
" 25th	...	6.51	"

## The Cyclecar Convenient.

A writer in *The Sunday Chronicle*, commenting on cyclecars, objects to tandem seating, but says the vehicle should be capable of being kept in the hall or front parlour!

## Police Trap.

A trap is working on the Maidstone Road between Riverhead and Seal, and an elderly motor cyclist on a luggage-laden touring machine, who was crawling along, was made one of the victims.

## Obstructing the Highway.

The landlord of the Gate, Matlock Bath, was fined 10s. and costs for obstructing the highway on the 31st ult. at Smedley Street Crossing. A trial from Liverpool was in progress, and a passing machine had jerked a stone against one of the hotel windows and broken it. This caused the defendant to place a rope across the road and keep it there about four minutes. The Bench considered the defendant had been very foolish indeed and inflicted the above penalty. The breakage was paid for.

## Belgian Race Meeting.

The automobile meeting at Spa, Belgium, September 21st to 24th, has received so far sixteen motor cycle entries. Among the entries are Indian, Rudge-Whitworth, F.N., Sarolea, Alcyon, Triumph and N.S.U.

## Stolen Motor Cycle.

A member of the A.A. has lost his 3½ h.p. Humber motor cycle and sidecar. It is a 1912 model and the frame number is 4251. The machine was stolen from a street in Camden Town.

## Motor Cycle Accident in America.

In our brief report of the sad track accident which took place in New Jersey, when Eddie Hasha rode over the palings on the top of the banking, we stated that it was reported that something went wrong with the engine, so causing the machine to leave the track. This was the general impression on the ground and was cable to us as the supposed cause of the accident. We now understand, from Mr. W. H. Wells, that it was quite a customary practice for Hasha, in endeavouring to overtake the other riders, to get on to the vertical palings at the top of the banking and Hasha (who was only just out of the hospital) might have become dazed, and owing to the speed at which he was travelling miscalculated his distance and ridden over the top.

## SPECIAL FEATURES.

### THE MOTOR CYCLE FOR TWO.

#### OPEN HILL CLIMBS

#### NORTH and SOUTH.

#### NOVEL ROTARY ENGINE.

## Overloading Sidecars—A Warning.

A member of the Croydon M.C.C., S. Hurlbart, sustained a nasty mishap near Bromley on Thursday last. He was driving an overloaded motor cycle and sidecar, when the bicycle broke just above the fork crown.

## Awards in the Six Days.

Mellor Jameson (6 h.p. Enfield sc.), who lost the A.C.U. gold medal, certificates, and silver cups awarded to him through being disqualified by the judges on a technical objection that his passenger had assisted in some slight adjustment of the machine, has been presented by the Enfield Cycle Co. with a silver cup on their own behalf to show their appreciation of his performance as a genuine private owner.

## Motor Cycle Taxation.

On Monday night last a White Paper was issued containing the report of the committee appointed last December to confer regarding the horse-power rating of motor cars. The committee suggest that the schedule of rates of duties should be amended in the case of motor cycles by the addition of a motor car or cyclecar class, not exceeding 5 h.p., to pay £1 per annum. The present taxation for a motor cycle weighing under three cwt. unladen, and with not more than three wheels, is £1. Cyclecars with four wheels, irrespective of weight and engine capacity, are at present liable to a tax of not less than two guineas, and if the cylinder bore exceed 102 mm. for singles and 72 mm. for twins, they are liable to a tax of three guineas. The committee's suggestion would mean that a cyclecar fitted with a single-cylinder engine not exceeding 89 mm. bore, or a twin not exceeding 63 mm. bore, would be taxed £1 irrespective of stroke. Four-wheeled cyclecars with engines over these dimensions would be charged at the usual motor car rates. Of course it must be taken into account that if this become law, and there is every reason to believe that it will, sidecar combinations where the engines exceed 89 mm. bore in the case of a single-cylinder, or 63 mm. bore in the case of a twin, will also be liable for the motor car taxation. The committee contend that the suggested alteration is to put on a fairer basis both the high and the low powered cyclecars and sidecars. Will the Treasury solve the definition of a cyclecar by means of taxation? It looks as though they will.

STOCKPORT M.C.C. SPEED TRIALS.

Two successful machines of a new make, built by J. Woodrow, of Stockport. J. Woodrow (5 h.p. Woodrow-Jap), the rider on the left, made fastest time of the day, while J. Emerson (8 h.p. Woodrow sidecar) was winner of the passenger class.

H. Thompson (3½ h.p. Kynoch) who it is said recently attained a speed of 59½ miles per hour for two miles. The ride was accomplished on a closed road. We should recommend Mr. Thompson to enter for Brooklands events.

#### An A.C.U. Worker.

Victor Hart, a prominent A.C.U. official, is shortly leaving for Johannesburg, where he has accepted the editorship of a leading automobile journal. We wish him success.

#### Preparations for 1913.

We saw F. W. Barnes last Saturday astride an experimental Zenith with a neat kick starter, and also a device enabling a free engine no matter what gear ratio is in use. Details cannot be divulged at present, as the machine has not undergone a sufficiently lengthy test.

#### The A.C.U., the Scottish A.C.U., and the M.C.U. of Ireland.

The reciprocity agreements between the Scottish A.C.U. and the M.C.U. of Ireland are practically complete, and will shortly be ready for signature. This means that members of the Irish and Scottish Unions may enjoy A.C.U. privileges in England, and vice-versa.

#### Auto Cycle Union News.

The following permits have been granted: The Liverpool A.C., hill-climb October 12th, and a reliability trial September 28th; the Manchester M.C., a hill-climb October 5th; the Birmingham M.C.C., a reliability trial September 20th; the Mersey M.C.C., a hill-climb on either 5th or 12th October. These permits for hill-climbs are granted subject to the hills being approved by the A.C.U.

**THE AUTUMN ONE DAY TRIAL.**—This event, which will take place on Saturday, October 26th, will start and finish at Kendal, while the course will be a stiff one in the Lake District. On the previous Friday there will be a council meeting in Liverpool at 2 p.m.

**THE FATE OF "THE MOTOR CYCLE" AND OTHER CUPS.**—It has been suggested that *The Motor Cycle*, *Auto Motor*, and *Motor Car Journal* challenge cups, formerly competed for in the A.C.U. race meeting now discontinued, should be put up for the following races, to be held by the British Motor Cycle Racing Club: One mile time trials, a three mile scratch race for machines up to 350 c.c., and a one hour scratch race for machines up to 500 c.c. This proposal has to come up before the General Committee for confirmation.

#### 1913 Models.

We have heard of a prominent West-country firm who are experimenting

with a four-cylinder air-cooled cyclecar. The machine is reported to be extremely neat in appearance, and as four air-cooled cylinders will keep cool on a motor bicycle, we see no reason why they should not do the same on a cyclecar if the engine be properly designed and fitted in front.

#### Motor Cycle Manager's Supposed Suicide.

It is with great regret that we have to announce the death of Mr. G. Schink, the London manager of the N.S.U. Company. Mr. Schink was a lieutenant of the reserve of officers in the German Army, and every year used to spend his holidays serving with the colours, to which time he used to look forward

FUTURE EVENTS	
Sept. 21.—Herts County A.C. Open Hill-climb.	
" 21.—Birmingham M.C.C. Open 24 Hours' Run to Carlisle.	
" 28.—B.A.R.C. Meeting.	
" 28.—Liverpool A.C.C. Open Reliability Trial.	
Oct. 5.—Edinburgh M.C.C. Open Hill-climb.	
" 5.—Manchester M.C. Open Hill-climb.	
" 12.—B.M.C.R.C. Race Meeting.	
" 26.—A.C.U. Open One-day Trial.	
Nov. 2.—N. Middlesex M.C.C. Open Winter Reliability Trial.	

with the greatest pleasure. He had just returned from his native country, and went straight to his office (Great Portland Street) and there, at the time of writing, appears to have shot himself, dying at once. No reason is known for this sad act. Mr. Schink was well known to the trade and to the many private owners he had to deal with, over whom he took the greatest trouble. He was an exceedingly hard worker, and to his untiring energy the success of the N.S.U. Company in England is due.

#### Arthur Moorhouse Memorial Fund.

The secretary of the Auto Cycle Union, Mr. T. W. Loughborough, writes to say that the above fund must now be closed. Will all holders of collecting cards therefore return them to the hon. treasurer, 22 and 23, Jewin Street, E.C., as soon as possible? Those who wish to subscribe to the fund, and have not yet sent in their subscriptions, are requested to do so without delay to the address given above.

#### The F.I.C.M.

During the Olympia Show week a meeting, at which an attempt will be made to re-found the Fédération Internationale des Clubs Motocyclistes, will be held of delegates from the bodies controlling motor cycle affairs in the various European countries and America, and to which the delegates from the Scottish A.C.U. and the M.C.U. of Ireland will also be invited. The secretary of the A.C.U. is using every endeavour to get into touch with the representatives of the foreign clubs. Curiously enough, the A.C.F. has so far ignored communications.

#### Urban District Council of Penge.

The Urban District Council of Penge, in a courteous letter, write as follows: "Complaints have been made by residents in Anerley that many motor cyclists ascend the Anerley Hill at a great speed, apparently for the purpose of carrying out speed tests, more especially on Sunday afternoons, and that it is not only a public danger, but also causes a nuisance by the noise created by the machines. The committee feel that they will be compelled to make application for speed limits in certain parts of the district if motorists will persist in travelling at such great speed, but they have, however, directed me to communicate with the motoring journals in the hope that they will appeal to those readers who travel through this district to drive slowly through the Anerley Hill and Beckenham Road, which are both busy roads with many sharp turnings, cross roads, and schools." Motor cyclists will do well to heed this warning.

NECK AND NECK IN THE SENIOR T.T. RACE AT BROOKLANDS LAST SATURDAY.

1.—The two competitors are: C. R. Collier (Matchless). 2.—O. C. Godfrey (Indian). The third rider is a competitor in the Junior event.

## NEW MODELS.

The big end.

A NEW CYCLECAR ENGINE.  
Method of holding down tappet guides.

Valve tappet.

## A New Cyclecar Engine.

A new engine has been specially designed and constructed for cyclecar work by Manly and Buckingham, engineers, of Spon Street, Coventry. The engine, which is a single-cylinder air-cooled of 90 mm. bore  $\times$  120 mm. stroke, includes several interesting features.

The firm have kept two main objects in view—to make an engine which will stand the heavy work imposed by cyclecar usage and to keep the price within reasonable limits—and we may safely say that the latter has not been accomplished at the expense of the former.

The cylinder, which has deep radiating fins, is swelled out at the top to accommodate the separate head fitted with large overhead valves; incidentally the ridge in

rockers can be removed with rockers and push rods complete. The crank case and timing case are cast in one piece and have a single cover plate, which carries the magneto, bolted on. Only two gear wheels are employed and the magneto is direct driven through

The cylinder head of the Manly and Buckingham cyclecar engine.

a flexible joint, consisting of a circular leather disc, to which are attached a pair of arms on the camshaft and a corresponding pair (at right angles) on the magneto-shaft.

The crankshaft, which is a solid forging of 1 1/4 in. diameter, is mounted in very long, plain bearings, and carries at one end a 15 in. outside flywheel weighing 28 lbs. The unit has a neat but solid appearance, and the engine without flywheel weighs well under 50 lbs. The firm are building a cyclecar to which this engine will be fitted; it has a pressed steel frame and a double chain drive to a counter-shaft, from which the drive is continued by belts. A two-speed gear is obtained by clutching either one or other of the chains to the counter-shaft.

The general arrangement of the new cyclecar engine.

the combustion chamber prevents the valves falling into the cylinder unless they should break off just below the seating. They are, however, well designed and made of carefully selected material, and should give little trouble in this way. As will be seen from the sketch, the cylinder head is flat and projects slightly into the combustion chamber, a broad flat face making the joint compression tight. A particularly sound piece of design is incorporated with the overhead valve rockers, which are supported on a double row of adjustable ball bearings, thus preventing the rattle which is so common with this type of valve gear. By undoing a single nut the arm which carries both

The engines will, however, be built and supplied without the cyclecar.

The Premier Motor Co., of Birmingham, who manufacture the Rex-Jap and the P.M.C. voiturette, are at present experimenting with a four-wheeled cyclecar. Details are not yet publishable, but the machine will probably be listed for 1913.

We inspected last week a useful little refinement which Rudge-Whitworth, Ltd., will fit to their 1913 models. Riders of these machines know that the magneto timing adjustment is one of the simplest. It will be further simplified for next year, as there will be no necessity to remove the timing gear cover. On the side of this latter, and opposite the end of the armature spindle, is a small gunmetal inspection cover plate. When this is removed, the magneto can be retimed with the greatest ease.

The Arden Motor Co., of Berkswell, Warwickshire, have made several improvements to the cyclecar which we recently described and illustrated. The magneto is now carried on a special bracket above the twin cylinders of the J.A.P. engine, and not down below as previously arranged. A new fan bracket has been designed which allows for adjustment of the belt. A large cylindrical exhaust box is now fitted in front of the engine just behind the starting handle; the J.A.P. automatic carburettor is used. This is connected to the cylinders by a flexible piece of armoured hose. Twenty-eight inch wheels are now fitted as standard. A recent inspection of several of these machines which are going through the works confirms our good opinion of this runabout, which is a sound practical job fitted with an upholstered body of reasonable width. The complete turnout presents a very smart appearance.

The latest firm to enter the motor cycle industry is the Monopole Cycle and Carriage Co., Ltd., Coventry. This firm has previously confined its attention to pedal cycles, but at Olympia, Stand No. 56, two motor cycles will be shown, namely, a 3 1/2 h.p. three-speed and a 2 1/2 h.p. F.E. lightweight. The name of the firm was omitted from our plan of the Show, published on September 5th, because this is the first intimation we have received that the Monopole Co. was marketing a motor cycle for 1913.

The 1913 twin Enfield. This new model has a 54  $\times$  76 mm. engine, overhead valves, and forced feed lubrication. It was ridden by H. V. Colver at Brooklands last Saturday.

# MORE WORLD'S RECORDS SMASHED—September 14th, 1912—BY

British Motor Cycle Racing Club Meeting,  
Brooklands Senior T.T. Race, 150 Miles,

Mr. J. L. E. Emerson on a 79 x 100 — 490 c.c.

## NORTON

(the smallest engine in the field)

WON, setting up the following

### WORLD'S RECORDS:

**100 MILES—**

1 hour, 33 min., 25.4 sec.

**150 MILES—**

2 hrs., 20 min., 27 sec.

**2 HOURS—**

127 miles,  
645 yards.

The  
marvellous  
regularity  
with which  
the NORTON can  
be appreciated  
from the fact that each  
of these records represent  
an average speed  
of about 64 miles per hour.

REMEMBER—

The NORTON holds the  
**1 MILE WORLD'S RECORD**  
**73.57 MILES PER HOUR**

made by Mr. P. Brewster. July 20th, 1912.

## IMPORTANT PUBLISHERS' ANNOUNCEMENT

During the two years "THE AUTOMOBILE ENGINEER" has been in existence, it has proved remarkably successful. We feel, however (and the impression is confirmed by the opinions expressed by many readers), that its scope and usefulness are curtailed by the restrictions which are necessarily imposed through publication only once a month.

The prime interest of "THE AUTOMOBILE ENGINEER" has all along been centred upon internal combustion engineering, but it has been found impossible, in a monthly paper, to treat the subject as broadly as was intended originally, and as is desirable in view of the enormous increase in the applications of the internal combustion engine.

It has therefore been decided to broaden the scope of the paper considerably by dealing also with other and larger internal combustion engines, their construction and application; in fact, to make the paper the authority on the subject of modern prime movers.

To render this enlargement of scope possible the paper will be published fortnightly, on and after October 2nd next, and the title will be altered to

## INTERNAL COMBUSTION ENGINEERING

incorporating "THE AUTOMOBILE ENGINEER."

The size, style and price of the paper will remain as at present, and the features which have established "THE AUTOMOBILE ENGINEER" will be retained, but the greater frequency of publication will permit exhaustive treatment of a far wider range of subjects than hitherto has been possible. Fuller details will be published later.

## AMAC=====AMAC

### Cumberland M.C.

Results of this club's hill-climb, which was run off on September 12th, at Warrnell Fell, on the knock-out system, are as follows: Motor bicycles—1, L. Pierce (3½ Corah-Jap); 2, J. W. Moffat (3½ Singer); passenger class—1, Eric Longden (8 Jap); 2, —. Payne (7 Indian).

### Cork and District M.C.C.

The results of the reliability trial, which took place on September 11th, are as follows: 1, H. Flannagan (3½ Zenith); 2, L. Dobbin (8 Matchless); 3, R. S. Russell (3½ Matchless). The course included two severe hills, and the chief award was a prize presented by the Rover Company.

### Cape Peninsula M.C.C.

A slow speed test was held on August 24th. A deserted level road was chosen and 176 yards measured off. Competitors were not allowed to exceed two miles an hour, and the best performances were put up by the following: 1, Rev. S. B. Priston (3½ P. and M.), time 3m. 58½s.; 2, Dunean McMillan (3½ Bradbury), 3m. 53½s.; 3, A. Douglas (3½ Triumph), 3m. 18½s.

### Bristol M.C.C.

The members' hill-climb was run off on September 14th on the final portion of Blagdon Hill. The course was straight, about one mile long, and not steeper in any place than 1 in 10. The various classes were run off on the "knock-out" system. Results:

Up to 345 c.c.: W. B. Gibb (2½ Douglas).

Up to 500 c.c., touring class: W. H. Moxley (3½ Rover).

Unlimited: P. H. A. Mathews (3½ Ivy-Precision).

Passenger class: F. P. Davies (3½ Rudge Multi).

Best performance by member who had not previously won a prize in any hill-climb: H. Hutchinson (3½ Rudge).

### Portsmouth M.C.C.

A hill-climb took place at Gravel Hill, Shedfield, on the 11th inst. Results:

#### SOLO CLASS.

	Time.	F.M.
1. Bleach (3½ Bat) ... ..	26½m.	27
2. Kiln (2½ New Hudson) ... ..	44m.	26
3. Pearson (3½ Premier) ... ..	32½m.	25

#### SIDECAR CLASS.

	Time.	F.M.
1. Kiln (3½ New Hudson) ... ..	44½m.	30
2. Tappenden (3½ Premier) ... ..	50m.	28
3. Pearson (3½ Premier) ... ..	52½m.	27

The surface of the hill was fair, and the length about two-thirds of a mile.

### Sheffield and Hallamshire M.C.C.

The results of the recent reliability trial, Sheffield-Pickering-Sheffield, are as follows:

	Marks lost.
1. S. Sawyer (3½ Premier) ... ..	2
2. D. Bradbury (3½ Norton) ... ..	6
3. J. Haslam (6 Zenith) ... ..	6
4. F. Dover (3½ Premier) ... ..	7

Qualified for bronze medals: E. Cross, G. Carter, C. S. Squire, N. Newton, and J. A. Stacey.

The reliability trial on Saturday last proved a great success. The course embraced some of the most beautiful moorland country which surrounds Sheffield, and was quite off the beaten track. There was one test hill and the usual checks. Official results are not known until the arrival of the secret check times, but the following competitors completed the course in the allotted time: Sawyer (3½ Premier), Dover (3½ Premier), Durant (3½ Norton), Parker (2½ Douglas), Lambert (3½ Kerry-Abingdon), Dudley (3½ Precision), Eardley (3½ Premier), Carter (3½ A.J.S. sc.), Stacey (3½ Rudge), Donovan (3½ Zenith), and A. Carter (3½ A.J.S.).

### Herts County A. and Ae.C. (Motor Cycle Section).

Owing to the gratifying support promised, the third quarterly trial will be held on October 5th.

### Luton and South Beds. M.C.C.

The non-stop reliability trial at 20 m.p.h., held on September 7th, proved a great success. The course, which was a severe one of sixty-four miles, included Sharpenhoe, Pulloxhill (check), Liddlington, and Offley. Extra marks were awarded for quiet driving through villages and good ascents. Result: 1, Terry (New Hudson); 2, Gutteridge (Rudge); 3, Mussell (Rex 5 h.p.).

### Manchester M.C.

A hill-climb was held at Heyden Bridge on Saturday last. The various classes were run off on the "knock-out" principle with handicap, and the results were as follow:

Single-cylinder motor bicycles: 1, H. Taylor (3½ Bradbury); 2, J. Smith (3½ Triumph); 3, H. Reed (3½ Dot).

Twin-cylinder motor bicycles: 1, H. Reed (8 Dot); 2, J. McCann (7 Indian); 3, A. H. Cowap (7 Indian).

Sidecars: 1, H. Bottoms (3½ Triumph); 2, A. H. Cowap (7 Indian); 3, W. Houghton (3½ Bradbury).

H. Reed (8 Dot) made fastest time of the day.

### Cowbridge and District M.C.

A hill-climb was held at Ewenny on September 11th, the length of the hill being seven-tenths of a mile. Results:

Class I. (Machines with capacity up to 350 c.c., club members only).—1, J. R. Homfray (2½ h.p. Enfield); 2, D. J. Evans (2½ h.p. Enfield).

Class II. (Machines with capacity up to 560 c.c., club members only).—1, E. Clissett (3½ h.p. B.S.A.); 2, J. R. Staiens (3 h.p. James).

Class III. (Handicap for machines of any capacity, open to members of the Bridgend and Cowbridge Clubs).—1, E. Clissett (3½ h.p. B.S.A.); 2, A. Sanders (3½ h.p. Triumph).

Class IV. (Sidecar handicap, club members only).—1, J. R. Staiens (3½ h.p. James).

Apart from the programmed events, an open class was arranged. In the final H. Wessendorf (3½ h.p. T.T. Premier) beat E. Clissett (3½ h.p. T.T. B.S.A.).

M. Stoeffel (Alcyon). This machine was used in the International cup race in France. It is interesting to note this "pocket edition" of a motor cycle. We are surprised the organisers allowed such an obviously racing mount to compete against touring machines.

## Club News—

## Dewsbury M.C.

A hill-climb was held near Dewsbury on the 10th inst. Result: 1, F. Eastwood (6 Enfield); 2, H. Hainsworth (3½ Triumph).

## North-west London M.C.C.

The annual race meeting and gymkhana will be held at the Stadium on the 28th inst. The programme will consist of sixteen events, handicap and scratch races, cyclecar time trial, relay race, and five fancy events. An open permit has been granted for the scratch and handicap races. Light-weights are limited to 300 c.c. Entries close on the 24th and should be sent to Mr. H. J. Pooley, 23, Clifton Avenue, Finchley, N.

## Scottish A.C.

A class for motor cycles is included in the closed hill-climbing competition which is being arranged by the Scottish Automobile Club to take place at Tummel Bridge, Perthshire, on September 28th, commencing at noon. Entries close on September 24th, 11 a.m., to the secretary of the club, Mr. R. J. Smith, 163, West George Street, Glasgow.

## Western District (London) M.C.

A petrol consumption trial will be held on September 21st, starting at 4 p.m. A course sixteen and a half miles long has been selected, starting from the Bull Hotel, Gerrard's Cross, and passing through Slough. The results will be calculated by the A.C.U. formula, i.e.,  $\frac{W \times M \times X}{P}$ . Entries should be sent to the hon. sec., Mr. M. G. Tweedie, 1, Baldwyn Gardens, Acton, W., at once.

## Ipswich and District M.C.C.

Speed trials over a measured course of one mile took place on September 7th, and resulted as follows:

Single cylinders up to 500 c.c.—1, D. W. Popplewell (Triumph); 2, K. Portway (Rudge); 3, R. Fenn (Triumph).

Lightweights up to 360 c.c.—1, K. Portway (Humber); 2, D. W. Popplewell (Singer).

Touring models up to 500 c.c.—1, W. E. Sneežum (L.M.C.); 2, D. W. Popplewell (Triumph).

Any machine up to 1,000 c.c.—1, D. W. Popplewell (Triumph); 2, K. Portway (Rudge).

## Leicester and District M.C.C.

The results of the third reliability trial for the Edwards Cup, held on the 5th inst., over a fifty-six mile course, are as follow:

	Total error.
1. T. Nedham (3½ Champion-Jap) ...	1m. 12s.
2. H. Petty (3½ Singer) ...	2m. 19s.
3. A. L. Barker (3½ Singer) ...	2m. 41s.
4. N. Mee (3½ Bradbury and sc.) ...	3m. 3s.
5. R. G. Wainwright (3½ Champion-Jap) ...	3m. 8s.
6. E. Folwell (3½ B.S.A.) ...	3m. 10s.

## North Staffs M.C.C.

Results of the knock-out hill-climb held at Winkhill, near Leek, during the week-end are as follows: Fastest time, J. A. Prendergast (3½ Ivy); final of handicap, A. Miller (3½ Rudge).

## Derby and District M.C.C.

Results of the hill-climb held recently have been declared as follows: 1, G. S. Hall (3½ Scale-Jap); 2, F. A. W. Greeves (3½ Triumph). The winner of the petrol consumption trial held on Saturday last was A. L. Spriggs (3½ Bradbury).

## Walthamstow M.C.

A non-stop and reliability trial from Clacton-on-Sea to Woodford was held recently. The following made non-stop runs: J. W. Percival (2½ Douglas), F. W. Applebee (2½ Centaur), F. Picken (3½ Rudge), W. S. Low (3½ Scott), H. Chambers (3½ Humber sc.), D. Fairhead (5 Indian sc.), and L. Pullen (10-12 Waverly, car).

## Leicester County M.C.C.

A successful hill-climb was held at Ab Kettleby on Thursday last. The following are the results:

## LIGHTWEIGHTS.

	Results on time.	Results on formula.
H. J. Woodgate (2½ Douglas) ...	1	2
H. Petty (2½ Singer) ...	2	1
O. R. Pratt (2½ Premier) ...	3	3

## STANDARD SINGLES.

M. Simpson (3½ Rudge) ...	1	2
F. Snowden (3½ Rudge) ...	2	1
W. Lee (3½ Singer) ...	3	3

## T.T. SINGLES.

H. Petty (3½ Singer) ...	1
E. Folwell (3½ B.S.A.) ...	2
M. Simpson (3½ Rudge) ...	3
F. Snowden (3½ Rudge) ...	3

## STANDARD MULTI-CYLINDER MACHINES.

J. Pass (6 Clyde) ...	1	1
W. P. A. Chapman (6 Champion) ...	2	2
W. G. Glover (6 Rex) ...	3	3

## OPEN CLASS.

J. Pass (6 Clyde) ...	1
W. G. Glover (6 Rex) ...	2
H. Petty (3½ Singer) ...	3

## SIDECARS.

W. P. A. Chapman (6 Champion) ...	1	2
W. G. Glover (6 Rex) ...	2	3
F. Snowden (3 Rudge) ...	3	1

Ab Kettleby is on the main road from Nottingham to Melton Mowbray. The surface is very good, the bends are not severe, and the steepest gradient is about 1 in 6.

A group of competitors and spectators at the start from Sheffield of the Sheffield and Hallamshire M.C.C. trial on Saturday last.

Club News.—

**Manchester M.C.**

An open hill-climb will be held on October 5th. Full particulars may be obtained from Mr. C. E. Kettle, 31, Market Street, Manchester.

**Bournemouth and District M.C.C.**

A special run to North Devon will take place at the end of the month, starting on the 28th inst. A prize will be awarded to any member climbing Porlock, Beggar's Roost, or Lynton hills.

**Liverpool A.C.C.**

An open reliability trial will take place over a circular and sporting course in North Wales for the Reliance Challenge Cup on the 28th inst. The start will be from Hamilton Square, Birkenhead, at 8.30 a.m. There will be numerous classes and awards for both amateur and trade riders.

**Belfast and North of Ireland M.C.C.**

A successful hill-climb was held on the 7th inst. at Lisnabreeny Hill, Castlereagh. There was only one event on the card, which was run off in the presence of a large crowd of spectators on the time trial principle. The competitors started singly, and the handicap of each was determined by a preliminary run over the course; the time was taken on a stretch of about 600 yards. Result: 1, T. M. Cluny (Chater-Lea Peugeot); 2, W. Dunbar (Swallow Jap); 3, T. Brown (Brown). R. McKibbin (O.K. Precision) gained special prize, fastest time 25½s.

**Newcastle and District M.C.**

The Bevan-Gould reliability trial and hill-climb will take place on the 22nd inst. Route: Heddon, Corbridge, Hexham, Brunton Bank, Stagshawbank Top, West Woodburn, Elishaw Bridge, Otterburn, Elsdon, Thropton, Rothbury, Lakeside, Corby Hill, Alnwick, Eglingham, Wooler, Millfield, Cornhill, Coldstream, Kelso, Jedburgh, Hawick, Langholm, Longtown, Brampton, Greenhead, Chollerford, and Newcastle—a distance of roughly 220 miles. The hill-climb will be held on Corby Hill, which is about seven miles from Rothbury, and no competitor will be allowed to dismount after leaving Rothbury until he has reached Alnwick, where a stop will be made for weighing.

**Bedford and District M.C.C.**

A hill-climb took place on the 5th inst. The fastest time of the day was made by C. W. Jamieson (8 Matchless). Results:

Touring Class.—1, Woods (3½ Triumph); 2, Murkett (3½ Rover); 3, Allen (3½ Triumph).  
Tourist Trophy Class.—1, Crump (3½ Triumph); 2, Few (3½ Triumph); 3, G. Crawley (3½ Triumph).  
Unlimited Class.—1, C. W. Jamieson (8-10 twin Jap); 2, Few (3½ Triumph); 3, G. Crawley (3½ Triumph).  
Touring Sidecar.—1, Allen (3½ Triumph); 2, G. Crawley (3½ Triumph); 3, Kell (3½ New Hudson).  
Unlimited Sidecar.—1, Jamieson (8-10 twin Jap); 2, Allen (3½ Triumph); 3, G. Crawley (3½ Triumph).

**North Staffs M.C.C.**

A flexibility hill-climb was held at Aston, by Stone, on the 1st ult. The hill was almost half a mile in length. The climb was timed electrically by a device belonging to Messrs. Ashton and Madeley, the joint trial secretaries—the rider breaking a thread at the start started the watch, and breaking a thread at the finish stopped the watch. Results: 1, R. H. Attwood (3½ Bradbury), 39½s. fast, 2m. 58½s. slow, gold medal; 2, G. Tagg (4½ Regal), 42s. fast, 2m. 42s. slow, silver medal. Fastest time, J. A. Prendergast (3½ Ivy), 29½s.

**Dublin and District M.C.C.**

The markings in the open sidecar competition held on the 31st ult. are as follows:

	Marks.
G. Roche (3½ Rover) ... ..	*100
T. E. Greene (3½ Rudge) ... ..	*100
S. Allan (3½ Rover) ... ..	98
J. D. Weir (7 Indian) ... ..	97
E. W. Armstrong (3½ Rudge) ... ..	95
R. A. Latchford (3½ Humber) ... ..	92
F. J. Walker (3½ Rudge) ... ..	70

\* Tie for trophy.

It will be remembered that Roche, Greene, and Armstrong secured full marks at the open controls, and the two former secured full marks at the secret controls as well, and, therefore, tie for the Indian trophy.

**Essex M.C.**

The results of the run to York and back have now been worked out and passed by the committee, and are given below. Of a total entry of forty-five there were forty-two starters, of whom thirty-six finished within schedule time, twenty-three gold medals being awarded, seven silver, and four bronze, while one award was left over until the next meeting.

Gold medals.—Motor cycles: G. T. Gray (3½ Rudge), W. Cooper (3½ Bradbury), A. A. Lilley (3½ Singer), F. Roberts (3½ Rudge), J. A. Campbell (3½ Rudge), W. E. Rootes (3½ Singer), P. D. Walker (3½ Rudge), A. E. Uffelman (6 Rex-Jap), N. C. Dear (2½ Douglas), L. G. Brown (3½ Triumph), H. J. Beal (3 N.S.U.), H. Karslake (3½ Rover), and A. H. Gold (3½ Ariel). Sidecars: A. T. Stanton (3½ Bradbury), B. A. Hill (7 Indian), E. Frasetti (7 Indian), D. S. Kapadia (8 Rex-Jap), W. H. Wells (7 Indian), C. E. Mitchell (6 Bat-Jap), A. J. Sproston (3½ Rover), and W. C. Hemy (3½ Service). Cyclecars: D. S. Parsons (8 G.W.K.).

Silver medals.—Motor cycles: A. V. Deacock (6 N.L.G.). Sidecars: A. E. Brassington (6 Rex sidette), G. E. Revill (6 Zenith), W. K. Smith (7 Indian), and R. Lord (6 Rex sidette).

Bronze medals.—Motor cycle: J. H. Kerr (3½ N.S.U.). Sidecar: V. Garland (5 Clyno). Cyclecar: C. H. Corfield (6 C. and H.).

Special prizes.—Triumph Cup, G. T. Gray (3½ Rudge); best amateur sidecar, E. Frasetti (7 Indian); second motor cycle amateur, W. Cooper (3½ Bradbury); second sidecar amateur, held over.

A group of members of the Luton and South Bedfordshire M.C.C. on the occasion of one of their club runs.

## A DAY ON A W.D.

**D**URING a chat with Mr. Draper at the recent Coventry and Warwickshire hill-climb, he suggested that we should have a machine for a day's trial. Accordingly one day last week we took over a 3½ h.p. fixed gear model for a business trip in the Midlands. This sort of run tests a machine thoroughly, for though we encountered no really severe hills, yet the traffic conditions in large cities such as Birmingham and Coventry often necessitate a quick pick up on an up grade, and of this the W.D. proved itself fully capable. On our run over to Birmingham we had plenty of opportunities of testing the paces of the machine, and found that it would throttle down to a crawl and pick up quickly to a good speed. The engine had the silky feel of a well-balanced well-run-in engine, but had plenty of power. This silkiness is probably due, to a large extent, to the system of forced lubrication employed, which necessarily keeps the crankshaft and big ends floating on a film of oil.

This forced lubrication gives one a pleasant sense of freedom from trouble, as one has only to glance at the pressure-gauge and note that the needle indicates about 10 lbs. pressure to be assured that all is well. This was especially pleasant in the thick Birmingham traffic, as there was no need to bother about lubrication. In spite of the fact that the roads were up in many parts of the town, with the consequent congestion of traffic, the machine ran so slowly that only once did we have to dismount. Our readers will remember that the W.D. engines have a force-feed system through the crankshaft and up a copper

pipe in the connecting rod, and having leads to all the main bearings. Oil is forced through this system by a small "Albany" type pump, which may be bodily removed from the engine without letting out the oil from the sump. The pressure used may be varied by means of an accessible adjustment, but for touring purposes about 7 lbs. is found to be correct. The pressure on the gauge remains practically constant, for sufficient oil is pumped to maintain this pressure at quite low speeds, the surplus merely returning to the sump through a release valve.

We found the valve gear particularly quiet, and the crank case was as clean when we returned as at the start. Few people yet realise the advantages of forced lubrication, though in a short time it will probably become as universal on motor cycles as it is on cars, as its advantages are extremely numerous.

The W.D. connecting rod.

### LOST AND FOUND.

We receive many letters regarding accessories, etc., both "Lost and Found," which we are unable to find space for. As these particular matters are of interest to two persons only, viz., the finder and the loser, we keep a list of such articles, and, should we receive a letter from the finder which corresponds to the article lost, the two persons are put into communication.

"STUDYING THE MAP."

## Some Consideration on Silencers.

IT is evident from the suggestions that appear from time to time in *The Motor Cycle*, that a great deal of misconception exists on the subject of silencers.

When the exhaust valve opens, the explosion of the charge is not completed, and the sound of the explosion and the hot gases travel down the exhaust pipe to the silencer. The sound of the explosion, however, travels at a much higher speed than the exhaust gases, and, unlike the latter, is not confined by the exhaust pipe and silencer until the exit is reached. The sound impinges on the walls of the exhaust pipe and silencer, and is transmitted through them to the air outside. Of course only a portion of

Fig. 1.

the original sound escapes in this way; some of it is absorbed by the metal walls, but most of it is reflected back to the interior and finally escapes to the outside through the same openings as the exhaust gases. These gases travelling at a fairly high velocity are also noise producers, and if allowed to escape through the cut-out, help in making the familiar "barking," or if broken up by passing through a number of small holes cause a more or less "spitting" sound. In the latter case, slight back-pressure is inevitably produced as the gases escape comparatively slowly.

### Two Kinds of Sound.

The conditions described are those which obtain in most standard makes of motor cycle, and the two kinds of sound can be clearly distinguished by listening carefully. The sound which comes through the silencer walls has a "chugging" nature, while that which leaves with the gases has a spitting bark.

It may be thought that the sound which passes through the silencer walls is quite insignificant, but such is by no means the case. If the ordinary silencer holes are stopped up and a long pipe is taken from the silencer barrel to the rear of the machine and there connected to one of the various special silencers on the market, it is found that the exhaust gases leave almost inaudibly, but the "chugging" sound passing through the exhaust pipe and silencer barrel is now very evident, as it is no longer masked by the usual "barking." The only way to eliminate this noise is to absorb it. The ordinary standard silencer and exhaust pipe consist of thin metal, and are ill adapted for keeping in sound. It is a matter of everyday knowledge that some kind of padding is necessary to protect any space from noise, a common instance being seen in the case of a telephone box. If it were practicable some soft substance, such as putty, would form a perfect exhaust box. Such a substance being out of the question, one of the solutions of the problem

is to use some lining, such as asbestos cloth, in a metal case, and further, to ensure that the entering sound gets reflected backwards and forwards before getting a chance of leaving the silencer. At each reflection some of the sound will be absorbed, and eventually the whole of it will be dissipated.

It is quite possible to arrange such a thing without at all obstructing the exhaust gases, and the author has made a sidecar silencer on this principle which is extremely quiet, and having no hole smaller than the diameter of the exhaust pipe is found to give no back pressure. This silencer has for the shell a piece of iron stove pipe, 2ft. long and 3in. in diameter, with end plates bolted on. It is lined inside with a double thickness of asbestos cloth which is kept in position by a series of loosely rolled coils of coarse iron wire netting. A series of asbestos baffles are arranged to absorb and reflect the sound, the whole arrangement being clearly shown in fig. 1.

A small amount of sound penetrates the walls of the long exhaust pipe, but no doubt even this could be absorbed by an outer covering of asbestos cloth.

### A Fallacy.

One of the most frequent suggestions for silencers is the adaptation of the "injector" principle, and diagrams such as fig. 2 are given in illustration. In all such cases the high velocity of sound is not taken into account. When the sound from the exhaust pipe reaches the bend, it will travel both left and right with a velocity of 1,090 feet per second, or 723 miles an hour. An air current of this speed would have to be set up at the point of the funnel in order to prevent sound escaping out of its mouth. The bicycle

Fig. 2.

speed necessary to produce such an air current would be exceedingly high, and even when produced the roaring torrent of air would need a great deal of silencing on its own account, besides creating a big back pressure.

### Some Experiments with an Open Exhaust Pipe.

An open exhaust pipe does not of necessity mean lack of back pressure. On several occasions the writer has set his engine running comfortably on the stand with the exhaust pipe open, and then has placed a tall-form empty carbide tin over the pipe with the mouth of the exhaust a few inches away from the bottom of the tin. The tin was then gradually removed with remarkable effect on the engine; at one point, when the end of the pipe was some inches outside the carbide tin, the "back pressure" set up was so great that the engine was stopped. A factor of similar nature may be present in the standard type of silencer where the exhaust pipe enters through the side of a barrel. Different makers adopt different positions of entry for the gases, the most usual patterns being where they enter radially or tangentially, with the idea of avoiding reflection of the pressure wave back up the exhaust pipe and of imparting a spinning motion to the gases.

A. F. GIRVAN, B.Sc.

#### ANOTHER MANX LADY MOTOR CYCLIST.

Miss C. Gerard, of Glen Heien Hotel, the second lady motor cyclist in the Isle of Man. Her mount is a 1912 model two-speed open frame Douglas, which has proved a great success, having covered upwards of 2,000 miles without any trouble.

#### Trade Announcements.

Noble and Co., 115, Blackfriars Road, have opened premises expressly for the storage of motor cycles, which, in their opinion, will be of the greatest convenience for business men who ride to the city per motor cycle.

We have received particulars of a machine which is being marketed by the Cleveland Motor Cycle Co., Douglas Street, Middlesbrough. As it is made of everything of the best and is apparently a well-built machine, judging by the illustration, local readers will be interested to examine this machine at the address mentioned.

#### Spare Wheels for Cyclecars.

The Stepney Spare Motor Wheel Co., Ltd., have introduced a spare wheel specially made for the G.W.K. and other light cyclecars. Although the cyclecar is a light form of four-wheeled motor cycle, there is no reason why owners should not relieve themselves from the worrying annoyance of repairing air tubes while *en route*. The enterprise therefore of this firm of introducing a spare wheel so early for this machine is very commendable. The spare wheel in question is carried on the G.W.K. running board, slightly abaft the seating.

#### A Week in Waterproofs.

Several readers have written to ask for details of the waterproof outfit worn by our contributor during the Six Days' Trials. "The goloshes and the Flixxon cloth helmet were procured from a branch depot of Chas. Macintosh and Co., the well-known rubber providers. Good oilskins are procurable from several firms. Many motor cyclists imagine that the cheap, sticky yellow and black abominations sold by some outfitters are the only oilskins obtainable. Such should procure a catalogue from either John Barbour and Sons, South Shields, or Parker's, Lancaster. The outfit described in the article is genuinely waterproof, and less expensive than the average Paramatta suit, though possibly it is a shade more liable to tear."

## SPARKLETS

#### Tyre Successes.

At the Streatham and District M.C.C. hill-climb (Titsey), Hutchinson tyres gained no less than twelve firsts, and the makers point out that it is their proud boast that they have never constructed a special tyre for competition purposes.

#### Trade Notes from Manchester.

E. Woods, a well-known Manchester rider, has been appointed manager to the Manchester Motor Supply Co. at their new depot, 30, Deansgate. The firm has the sole agency for several different makes of motor cycles and cyclecars.

C. E. Kettle, trials hon. sec. of the Manchester M.C.C., informs us that he has severed his connection with Messrs. Lookers, Ltd., Hardman Street, Deansgate, and will shortly be opening show rooms, garage, and repair works in the Manchester district, specialising in motor cycles and cyclecars.

#### Catalogues Received.

To compile a complete parts list in the case of a firm which has made motor cycles since 1909 is rather a big order. One of the most complete price lists of motor cycle parts which we have ever seen emanates from the Hendee Manufacturing Co., 178, Great Portland Street, W. The book is carefully indexed so that no trouble should be occasioned in finding the price of any part of an Indian dating from 1909 to the present year. One has merely to turn up "oil tank" and

"hand oil pump," for example, and refer to page 58, when one finds all the details for the various parts under one heading, and one has merely to order by number. If the part be enamelled, the colour must be stated. Several of the more important parts are illustrated with thumb nail sketches and half-tone blocks. The book can be obtained from the Hendee Manufacturing Co., 178, Great Portland Street, W.

#### The Senspray Carburetter.

During a recent reliability trial a rider rode his Rudge machine, fitted with a Senspray carburetter, from Weston-super-Mare over Dartmoor to Plymouth, Torquay, Weymouth, Brighton, London, and Bristol, thence to Cardiff by train. He started from Cardiff with half a gallon in the tank, and purchased threequarters of a gallon at Taunton, one gallon at Plymouth and Weymouth, threequarters gallon at Frighton, and half gallon at London. The distance according to Cowey speedometer was 579 miles, and as there was over a pint of petrol left in the tank at Bristol the consumption works out at 132½ m.p.g.

#### Motor Cycle Exports.

The Premier Motor Co., Ltd., Aston Road, Birmingham, inform us that they are now exporting about twelve Rex-Jap machines per week to South Africa. The firm have just heard from Messrs. Gibson Bros., their Kimberley agents, that they are perfectly satisfied with the results of the sample machine imported. This South African firm enquired for particulars regarding the sole agency for Kimberley and Johannesburg, and were advised to have one machine out first to see whether it would suit the severe conditions of the Dominion. As the result of the behaviour of the sample machine they are now enquiring if the agency is still open.

#### 20,000 MILES IN FIVE MONTHS.

Harry Long, who recently completed a "Round the Coast" ride on a 4 h.p. two-speed Singer sidecar, covered 20,000 miles in five months. From many out of the way spots Long has been snapped by readers who have kindly sent us copies of the photographs.

# ONE WEEK-END'S SUCCESSES ON "ZENITHS" FITTED WITH THE WORLD RENOWNED PATENT GRADUA GEAR.

special prize for best performance in the 3½ h.p. class.  
He was using "Sternol" Standard Quality Oil on  
his 3½ h.p. Singer.

*Write for particulars and prices.*

STERNOL 56, Royal London House,  
Finsbury Sq., London, E.C.

## JUST THE TIME OF YEAR

when protection is required  
against wet and mud.

Extra mudguards may keep  
the rider clean, but they  
certainly do not prevent water  
carrying grit from working  
havo in unprotected hubs  
and other bearings.

HUB LUBRICANT is recognised as an ideal  
lubricant for ball bearings. Its special value  
however, is in the protection that it affords  
against the ingress of wet and mud.

The Judges in their Report  
on the 1912 A.C.U. Six Days'  
Trial emphasize the need for  
adequate lubrication of the  
hubs and other ball bearings  
to protect them from the disas-  
trous effects of wet and grit.

1912 Lists detail other uses of Hub Lubricant—

PRICE'S PATENT CANDLE CO. LTD.,  
BATTERSEA, LONDON, S.W.

Hub Lubricant—post free—½lb. tins, 9d. : 1lb. tins, 1/-

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

### SECTION II.

York and Lancashire.

### SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

### SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

### SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

### SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

### SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

### SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

### SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

### SECTION X.

Scotland.

### SECTION XI.

Ireland and Isle of Man.

### OUR BETTER VALUE

Includes lower prices for later models of most famous makes and a selection of over 300 machines of New and Second-hand 1912 makes only slightly used, overhauled, fully repaired, and guaranteed.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal to perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under 10 the fee is 7s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR BICYCLES FOR SALE.

# A TIMELY TALK

to winter riders.

The weather is miserable, and if you appreciate real comfort awhile during the winter months, ensure it by the fitting of a P.M.C. Sidecar—with this Sidecar, you will be absolutely immune from side-slip, even upon greasy tram lines and stone sets—and the ease with which the machine can be manipulated in traffic without taking the feet off the foot-rests gives added comfort and confidence of control. The ease of attachment, light weight, and scientific construction, make the P.M.C. the most practical and efficient Sidecar on the market.

Price, Coachbuilt, £7 12 6

„ Wicker, £5 17 6

Our 1912 Catalogue, containing a complete range of Sidecars will be of interest to you. Copy sent post free on application.

ESTABLISHED 20 YEARS "IN THE HEART OF THE TRADE"

## COLMORE-DOUGLAS

You want success, quality, reliability; the best all-round results obtainable in a motor cycle; get at once a Douglas, a Colmore-Douglas, from the best Douglas agents, the Colmore Depot of Birmingham, Manchester, Leicester, and Liverpool.

Delivery is prompt and certain, machines are fresh and new, attention is careful and experienced.

We have supplied Douglas machines, Colmore-Douglas machines, to many of the most successful of the riders of the day, for instance:—

## MR. MACNAB,

who weighs 16 stone and stands six-foot-three, yet he wins hill-climbs on time against men half his size, upon his Colmore-Douglas.

Aug. 28. Surrey M.C. Climb .. Fastest and first on formula.

Aug. 3. Mersey C.C. Climb .. Fastest time on a lightweight.

## MR. BAILEY,

another Colmore-Douglas rider, has astonished the Frenchmen (and the Englishmen, too) by riding 246 miles at 47 miles an hour, on the road. The most wonderful long ride ever accomplished, and upon a Colmore-Douglas supplied by Colmore Depot.

## MR. REX MUNDY,

Another recent convert to the Douglas, has now a Colmore-Douglas, bought from us. He swept the board at the Streatham Climb ten days ago, winning almost every class, and beating many 3½ h.p. machines, as well as easily leading all other lightweights.

## Moral? What is the machine to get?

## Why a Douglas—a Colmore-Douglas.

Perhaps you are yearning for one of these, but there is some little difficulty—write us, and see if we can make some arrangement with you.

## COLMORE

35, Colmore Row, Birmingham.  
18, Renshaw St., Liverpool.  
261, Deansgate, Manchester.  
62, High St., Leicester.  
45, John Bright St., Birmingham.

<b>DOUGLAS</b> , 24 h.p., 1910 model, nice order .....	227	10
<b>MOTO-REVE</b> , 2 <sup>1</sup> / <sub>2</sub> h.p., 1910 model, good solo mount, perfect .....	218	0

## SIDECAR

One only Brand New "TURNER" coach-built, painted Lincoln Green, 24in. tyre, luggage grille, hood, screen, fits any standard machine; usual price, £18 ios.; clearance price .....

Owing to the extraordinary low prices quoted above, we are unable to entertain any exchanges. Remember, there can only be one buyer for each of the above. WE CANNOT REPEAT. Come early and avoid disappointment.

## Haslingden.

Telegraphic Address: "Cordingley, Haslingden."  
Telephone: 2Y, Haslingden. w.h.n.

## MOTOR BICYCLES FOR SALE.

**RELIABLE Motor Cycle**, fitted 24h.p. Minerva, 1912 Mabon clutch, B. and B. Bosch, all h.b.c., Palmer cord, Lucas, perfect condition; £18/10.—A.C., 20, Eland Rd., Clapham Junction. [5230]

**BARKER'S** for Motor Cycles.—In stock and ready for instant delivery. —Triumph, Singers, Motosacoches, and the spring frame Barker-Palmer, 1912 model.—John Barker and Co., Kensington High St., W. [0075]

**F.N.** 24h.p. Lightweight, 2 speeds, free engine, shaft drive, ideal little machine, in perfect condition; Jones speedometer, complete with tools and spares; £26. —C. Heron, Dalwood, 180, Beulah Hill, Upper Norwood. [5553]

**LINCOLN** Elk, 34h.p., 1912, only run 600 miles, lamp, horn, mirror, spare belt, valve, plugs, etc.; £26, or nearest offer this week; owner leaving England.—Fenton, 9, Cazenove Rd., Stoke Newington, London, N. [X4584]

**RUDGE**, 1912, speedometer, P. and H. lamp, spare valve, 2 belts, unspractured, unpunctured, perfect in every detail; accept £42, no offers; Kent county.—Box L8,679, The Motor Cycle Offices, 20, Tudor St., E.C. [5311]

**TRIUMPH**, 1912, free engine, delivered fortnight ago, fitted up with Cowey speedometer, Miller oxidized lamp and generator, and all spares, only ridden 40 miles; cash price £55.—To be seen at Erwin, Joiner, Grove Crescent, Kingston. [5358]

**F.N.**, 1911, 4-cyl., 5-6 h.p., 1912 clutch, Stewart speedometer, P. and H. lamp set, horn, tools, spare cover and buffed tube, £35; 2-speed, £42; sidecar and luggage carrier £45; £2/10 insurance transferred; see any time.—955, Fulham Rd. [5543]

**ZENITH**, 34h.p., Nov., 1911, 28/8 sidecar, 2 large Lucas lamps, and large generator, speedometer, extra tube unused, 2 belts, tyres perfect, spare petrol tank, all spares; cost £72, accept £55.—Turner, 9, Albany Rd., Stroud Green, N. [X3901]

**P. and M.** (1909), in excellent condition, 2-speed, free engine, machine just overhauled, and engine lately thoroughly overhauled by makers, tyres new; can be seen by appointment; £30 or near offer.—Haydon, 189, Penton Rd., Vauxhall, London. [5509]

**QUADRANTS**—1912 models supplied by Cass's Motor Mart from stock. 44h.p. passenger model, recognised as the finest combination for solo and sidecar work; exchanges and extended payments; for particulars and latest catalogue apply Cass's.

**CASS'S**—Triumph, 34h.p., 1911, clutch model; any examination; £39.

**CASS'S**—Motosacoches, 24h.p., 1912, brand new, var. gear; £39.

**CASS'S**—P. and M., 34h.p., late 1910, 2-speed; bargain, £58.

**CASS'S**—T.A.C., 4-cyl., 3-speed, gate change, B. and B. var. jet carburettor; any examination; £35.

**CASS'S**—J.A.P., 34h.p., B. and B. carburettor, mag.; bargain, £18.

**CASS'S**—Minerva, 24h.p., B.S.A. fittings, good running order; £9/9.

**CASS'S** for Sidecars.—Torpedo pattern, with side door, apron and mat, 24in. tyre, quick detachable joints; from £6/15; best value obtainable.

**CASS'S** will send complete list of their splendid stock of 2nd-hand and new machines upon application; inspection of stock in situ, exchanges or extended payments arranged.—5, Warren St., W. (opposite Warren St. Tube Station). Tel.: 3624 Mayfair. [5533]

**19** 11 24h.p. 3-speed New Hudson, in first-class condition, J.A.P. engine, 2 speeds, only run 1,200 miles, engine, appearance, and general condition perfect.—Grove Bros., 190, High St., Guildford. [5592]

**FOR Sale**, 24h.p. 1912 Singer, bought end of March, splendid condition; £55, including cycloset, lamp, generator, horn, extra toolbag, new Brooks saddle.—Apply by letter, firstly, M. F. T. Cleaver, 11, Carlton Hill, St. John's Wood, London, N.W. [5542]

**SOUND Bargain**—34h.p. White and Poppe, enamelled grey, like new, plating perfect, h.b.c., 24 inch, overhauled tubes, new rubber belt, lamp, horn, pump, tools, spare cover and tube and valve, 2 accumulators, wipe contact, will hold 14 stone on compression; £12.—Waterman, Chorleywood, Herts. [5520]

**8**h.p. Overhead Valve J.A.P., 85x85, Chater No. 9 frame, No. 2 spring forks, Jones speedometer to 80, Lucas lamp and generator, only done 1,800 miles, perfect condition; £45.—Blake, c/o Bamford's Garage, 42, Providence Place, Brighton. [X4320]

**19** 11 F.N., 5-6 h.p., perfect condition, little and carefully used, enamel, plate, and tyres good order, £32; Jones speedometer, £3/10; 6h.p. twin Rex, free engine, lately overhauled, quick sale £23; ride reasonable distance.—Letters only, Bennett, Woodside Lane, N. [5623]

**19** 12 Phelon and Moore, purchased new July 1st, cost £70, hardly ridden, all spares, tools, Jones speedometer, tyres as new, guaranteed perfect and genuine; honest reason for selling; sacrifice, £58.—Grimaldi, 5, Hillside Mansions, Jackson's Lane, Highgate, London. [5613]

**P. AND M.**, 34h.p., 1910, nearly new 24 back tyre, spare cover and tubes, tube case, extra girders, XL all, Cowey, lamp, watch, mudshields, all spares and tools, the whole in excellent condition; £43; buy-runabout.—Thomas, 30, Narbonne Av., Clapham Common, S.W. [5568]

# THE MOTOR CYCLE

LEADERETTE:

## Motor Cycle Taxation.

**A** BRIEF reference made last week to the recommendation of the Committee which has sat since last December to consider the question of motor car taxation has, as we expected, caused quite a flutter in the motor cycle world. The secretary of the Manufacturers' Union immediately circularised his members, asking them for opinions regarding the suggestion that motor cycles with engines over 89 mm. bore should pay two guineas, the Treasury rating this as 5 h.p. If a majority of the members think that a protest should be entered, the Treasury will be approached and asked seriously to consider this recommendation. Our view is that the suggestions are fair only so far as they apply to cyclecars, *i.e.*, four-wheeled cyclecars fitted with single-cylinder engines under 89 mm. bore should not be expected to pay more than the motor cycle tax of £1. Even this is 5s. too much while two-wheeled horse-drawn carts pay 15s.

It will be seen, on reference to the motor car table showing the tax upon any size of motor car and published by *The Autocar*, that the owner of a twin-cylinder cyclecar will, if the recommendation becomes law, have to pay two guineas per annum when the bore of the cylinders exceeds 63 mm., and three guineas per annum when the cylinder bore exceeds 72 mm.

For three guineas a twin engine can have a 98 mm. bore. Four cylinder car engines practically commence at three guineas with a bore of 64 mm., and over 68 mm. they are four guineas. Of course, for two guineas a single-cylinder engine can be fitted up to 102 mm.; this equals by Treasury formula 6.45 h.p.

Where the recommendation will affect motor cyclist owners is in the case of motor bicycles and motor bicycles with sidecars fitted with V twin engines which exceed 63 mm. bore. Now practically all twin-cylinder sidecar machines have engines exceeding this dimension, and the majority of them exceed 72 mm., and they will have to pay a tax of three guineas per annum, which is the same as a 68 mm. four-cylinder motor car. Even the four-cylinder F.N. comes within the two guineas tax, as, although the total capacity of four cylinders  $52\frac{1}{2} \times 57$  mm. only equals 494 c.c., the horse-power by Treasury formula is 6.8.

The formula being  $\frac{52\frac{1}{2} \times 52\frac{1}{2} \times 4}{1613}$ , it will be

seen by this that, although the committee doubtless wishes to separate the cyclecar from the heavy motor car, as regards taxation, its recommendation, although perhaps fair to cyclecar owners, is most unfair to motor bicyclists and sidecarists. In the White Paper recently issued is a printed statement handed in by Mr. Archibald Sharp, representing the Auto Cycle Union. In his statement Mr. Sharp recommended that motor cycles should be taxed in general

on a sliding scale of capacity. Apparently his suggestions have been entirely ignored. He recommended an annual tax of 10s. up to 350 c.c., 20s. from 351 c.c. to 500 c.c., 30s. from 501 c.c. to 800 c.c., and over 800 c.c. 40s. He also pleaded that there should be a reduction on old pattern machines, and, quoting from *The Motor Cycle*, pointed out that in our sales columns the prices of sixty machines varied from £7 10s. to £62, the average being £30 3s. This and the c.c. rating have been totally ignored, which seems strange, considering Mr. Sharp was the only person consulted on the question who, so far as we know, had any practical knowledge of motor cycles.

## A Complicated Position.

**T**HE position is really very complicated, because on the one hand we have the Treasury formula recommended by the R.A.C., and, on the other hand, we have the definition of the R.A.C. and A.C.U. with regard to cyclecars, where the total cubical capacity of the engine is fixed at 1,100 c.c., the bore and stroke in this instance being both accounted for in the calculation. For example, an engine with a total cubical capacity of 1,100 c.c. allows for a twin-cylinder of approximately 88 x 90 mm. Now a two-cylinder engine of 88 mm. bore on the Treasury formula is over 9½ h.p., and a tax of three guineas is demanded. To quote an example of the iniquity of the suggested taxes, the owner of a four-cylinder motor bicycle of under 500 c.c. would have to pay as much as the owner of a 6½ h.p. motor car, and a twin sidecar engine over 72 mm. bore would pay the same as an 11 h.p. car.

At the moment of writing it is impossible to say whether the recommendation will become law, but we hope it will not—at least, we hope that motor cyclists will be allowed to run two and three-wheeled machines with the present annual payment of £1. We do not say this because motor cyclists, generally speaking, are men who cannot afford more, but because we think that on the lines of general taxation motor cyclists are sufficiently burdened already. We are called on to pay 1s. 6d. per gallon for petrol, and 3d. of this goes to the Treasury. We pay £1 per annum for the use of the roads, and only a portion of it goes to the Road Board for road maintenance and improvement. We pay 5s. for a driving licence each year, or a total of over £2, basing the petrol consumption at 80 m.p.g. and 5,000 miles per annum. This sum from 75,000 riders should satisfy even the most rapacious Chancellor of the Exchequer. What really ought to have been recommended was a taxation by bore and weight combined. Then a light motor cycle fitted with a low-powered engine and incapable of high speed would have got off lightly as it should do, and a light or heavy machine with a more powerful motor would have been taxed in proportion to its higher power and speed.

# ANOTHER FOUR-CYLINDER CYCLECAR.

FEATURES: Motobloc cylinder casting, enclosed valves, worm drive.

Chassis of the latest Aeries 8-10 h.p. four-cylinder cyclecar, which has a channel steel frame and three-quarter elliptical springs at the rear.

**W**E dealt last year with the Aeries Ponette, and now are able to describe the 8-10 h.p. four-cylinder model, which comes within the cyclecar definition on account of its weight and cylinder capacity. The motive power is a four-cylinder monobloc water-cooled engine, 59 x 100 mm., with chain driven cam and magneto shafts. All the valves are on the near side, and the exhaust chamber is neatly ribbed. The Marvel automatic two-jet carburettor is also on the valve side, only the mag-

neto being on the off side. As regards lubrication, a rotary gear wheel pump delivers oil to the main bearings and keeps a constant level in the troughs, in which the big ends dip. The water circulation is on the thermo-syphon principle.

## Transmission Details.

The clutch is of the leather-covered cone type, while the gear box, which is neat and small, contains three speeds forward and a reverse, the ratios being 4, 7, and 10 $\frac{1}{3}$  to 1. The rear brakes are of

the internal expanding type, and may be put into operation either by a pedal or hand lever. The chassis is of pressed steel, narrowed in front to allow an ample lock. The drive from the gear box to the back axle is by propeller-shaft, the final transmission being by worm. The chassis is suspended on semi-elliptical springs forward and three-quarter elliptical springs at the rear, the latter being of somewhat unconventional design. 700 x 75 mm. tyres are fitted. The neat two-seated body with scuttle dash is clearly shown.

Left and right side views of the Aeries water-cooled engine, which has a monobloc cylinder casting and valves entirely enclosed.

## OPEN RACE MEETING AT BROOKLANDS.

On October 12th at the British Motor Cycle Racing Club open meeting at Brooklands the following Auto Cycle Union Championships will be run off: One hour race for machines with engines of a cylinder capacity not exceeding 500 c.c. for *The Motor Cycle Challenge Cup*, a one hour race for machines not exceeding 350 c.c. for *The Automotor Challenge Cup*, and

a five-mile race for machines with engines not exceeding 1,000 c.c. for the *Motor Car Journal Challenge Cup*. These cups are being put up for these races subject to the consent of the donors for this year only. The winner of the challenge cup in each race will also be awarded the Auto Cycle Union gold championship medal, which will be presented by the B.M.C.R.C.

The second man to finish will be awarded the Club gold medal, the third man the Club silver medal, and the fourth man the Club bronze medal. Earlier in the afternoon there will be a cyclecar and sidecar race. Entries will be 7s. 6d. for members of the A.C.U. and B.M.C.R.C., and one guinea each for those unconnected with either of these bodies.

# Occasional Comments

by "Felix"

## Hub Gears.

I hear that some of the most conscientious firms in the industry have failed to perfect the three-speed bottom bracket gear. It has proved unexpectedly difficult to obtain a design which should be light in weight, proof against the vagaries of non-mechanical clients, and capable of delivering a maximum percentage of the engine power at the road wheels on the lower ratios. (I am at the moment referring to epicyclic counter-shaft or bottom bracket gears; the sliding dog clutch type has long since proved its reliability.) It is therefore probable that many leading firms will fit proprietary three-speed hubs next season for all customers who desire a variably geared model. I sincerely hope that they will include some dodge for making the rear wheel more readily detachable; my chief objection to modern three-speed hubs is the time required for changing a cover. If no such device be incorporated—and beyond contradiction it will tax ingenuity—I advise a heavy and costly cover which may be expected to outlast a season's riding.

## A Wet Weather Tip.

During the recent long distance trials several riders came through the wettest runs without being soaked, and questions elicited the fact that they wore oilskins under ordinary waterproofs. Since then other riders have adopted the tip. They use fawn Paramatta suits for general riding, these suits making the neatest garb for all ordinary work, and failing only when wind and rain test their proofing to the uttermost. As soon as a real drencher begins, a small roll, consisting of light oilskins of good quality, is unpacked from the usually empty corner between the tail of the carrier and the back mudguard, and these oilies are worn beneath the Paramatta until the rain stops. A suit of good oilies can easily be packed in the corner described; but personally I should prefer to wear them over the Paramatta, rather than beneath it, for two reasons, oilskins dry quickly, whereas Paramatta, once sodden, dries slowly; and why strip off the Paramatta suit, when oilies can be cut loose enough to fit over it? Flixson cloth suits are becoming very popular amongst cyclecar owners. They are not cheap, but their varnished surface shoots away the heaviest rain, and they look neater than the best oilies. By the way, we are still waiting for a durable waterproof glove. Indiarubber gloves are costly and soon perish, owing to their frequent contact with oil. Asbestos gloves are genuinely wetproof, but are rather thick and heavy for use on a motor bicycle, with its small control levers. Most of us continue to use leather gauntlets, which are only temporarily satisfactory.

## Cyclecar Carrosserie.

I notice that some cyclecar makers are committing the same blunder which for years disfigured the productions of most automobile factories, i.e., they fail to provide adequate front mudguarding. Last week

a friend of mine drove 120 miles on a cyclecar which had front mudguards without any down-turned lip and without flaps between guard and bonnet. His machine and person were in an indescribably filthy state when he reached his destination. If a machine possesses running boards, the gap between the boards and the side members of the chassis should also be filled in with leather or waterproofed canvas. These additional guards cost a good deal of money when the work is done by the trade, for patent leather is expensive, and the work takes time. A car catalogue before me as I write charges about seven guineas for these three indispensable extras. I have once or twice made the guards myself for different vehicles at very small expense. Paper templates may be cut, and taken to a shoemaker's supply stores, when the leather can be cut from odd bits at a reduced charge, instead of a whole hide being used. The inside flaps for the front guards may be fitted with brass eyelets, and laced to guard and frame with hide laces; this method is more lasting than rivets. The lip to prevent mud and water blowing back from the outside edges of the front guards may be bent out of sheet iron and riveted *in situ*. The filling pieces to cover the interstices between running boards and chassis require a great deal of leather, and I should be inclined to experiment with some cheap waterproof fabric, such as Willesden canvas. These fillings must be so attached as to avoid leaving a trough in which dirt can collect. If cost be no great concern double glazed leather can be obtained from a good leather shop. Patent leather glazed both sides enables mud, etc., to be more readily sponged or swilled off.

## A LONG TOUR THROUGH EUROPE.

Two American tourists, the brothers Cooleage, of Atalanta City, Georgia, with their 7 h.p. Indian and Thor motor cycles, on which they have just completed a 5,000 miles trip. They arrived at Dover one day last week, and describe their trip in the vernacular as a "nifty" time.

## THE MOTOR CYCLE IN INDIA.

THE photograph herewith may possibly be of interest to some of the readers of *The Motor Cycle* as being representative of the growing popularity of the motor cycle in these parts. The photograph depicts two Triumphs and three F.N.'s, although the first motor cycle brought to this district was a Rex, which, owing to the extreme nature of the roads (sic) at that time—1904—was not very successful, and the engine of the same eventually found its way on to a small 2½t. gauge trolley.

The improvement of the roads—and incidentally the motor cycle—led to the introduction in 1907 of a Triumph, and this was shortly followed by a 1½ h.p. F.N., both of which have done most excellent work and are still running as well as ever. The year 1909 saw another Triumph and a 2½ h.p. F.N., and the latter part of 1910 yet another 2½ h.p. F.N., and more recently a 2½ h.p. New Hudson. It speaks well for the enthusiasm of the sport up here when it is borne in mind that for six months of the year the roads are absolutely un-motorable.

Being in the "jungle," of course we have the usual (I say usual, for it seems that most colonists suffer in the same way) trouble about obtaining spares, etc., and as for repair work, we have to do practically everything ourselves. Our greatest bugbear is undoubtedly the treatment we receive at the hands of the majority of firms in the Old Country. For instance, one of our members sent for a two-speed gear for his Triumph. The gear in question is one extensively advertised "to fit any machine," but after waiting some eight months he was informed that he would require a new rear frame at a cost of £4 10s. extra. He eventually received the gear after nearly eleven months from the time of ordering, and then only to find that the new frame was out by some ¾ in., which threw the wheels out of alignment by inches.

Motor cyclists in the jungle. (See letter on this page.)

The business methods of our nearest motor firms—some 400 miles away—are also in need of a little "tuning up." For instance, some new wheel spokes cost us Rs. 14 (1s. 8d.) each; again, a sparking plug Rs. 7 (9s. 4d.), purchasable in England for 3s. 6d.! The "latest" is an estimate of Rs. 20 (£1 6s. 8d.) for rebushing a Triumph connecting rod, which, compared with the price of a new connecting rod complete from the Triumph Co. at 11s., shows how very anxious our friends are to get rich. Spares, apart from valves and one or two unimportant parts, are unobtainable.

Our experience of motor cycling here points to several desirable features, such as larger tyres, heavier rims and spokes, wider mudguards with more clearance, larger tanks, improvements in carburetter to protect it from fine sand, and, of course, some arrangement of rear springing.

In conclusion, I would like to express our appreciation of the Triumph and F.N. motors, both of which makes have given every satisfaction, and, when fitted with two-speed gear, are eminently suitable for our rough and hilly district.—F. S. LOVICK JOHNSON, A.M.I.M.E., Sylhet, India.

A group of motor cyclists at Eden Gardens, Calcutta, India, who took part in the recent motor cycle race on the Barrackpore Road.

# NEW PREMIER MODELS.

Premier two-speed counter-shaft gear. On the primary shaft are mounted a multi-plate clutch (in the centre), also the engine chain sprocket and the 8in. driving pulley.

**T**WO new Premier models have undergone their preliminary tests and are now under construction for 1913. The first is a special three-speed model, which includes several improvements. The engine is similar to the present  $3\frac{1}{2}$  h.p., and retains all its special features, such as auxiliary exhaust port, gear driven magneto, pear-shaped radiating fins, etc., but it is carried in a new type of frame which allows the cylinder to be removed with ease, and carries a substantial form of bottom bracket and pedalling gear. Druid forks are also fitted to the model we inspected. The tank has a considerably larger capacity, and has neatly rounded corners, which greatly enhance its appearance. The rear wheel is fitted with a 6 $\frac{1}{2}$ in. wide mudguard. A front wheel stand and a neat spring up rear stand are incorporated with the new frame.

The foot-rests give a choice of three positions, and can be varied to suit the requirements of the rider by detaching the rubber pads and remounting them

on the crossbars in a different hole. The carrier supports a pair of metal covered pannier bags, and, with the mud-guard, swings downwards to facilitate tyre repairs. The Armstrong Mark V. three-speed hub is employed, and our readers will remember that this gear allows the engine to be started with the back wheel on the ground. The drive is by a lin. belt, which is protected at the front by a neat aluminium casting enclosing the pulley. This model should make an ideal touring mount, and the machine on trial has run long distances with a heavily loaded sidecar.

## A New Departure.

Those who prefer the counter-shaft gear will be suited by another new model which is being specially manufactured for sidecar work. This has also the  $3\frac{1}{2}$  engine, and, in most respects, the frame resembles the one described above, except for the fact that footboards replace the adjustable footrests.

The chief novelty lies in the gear itself, which is mounted behind the seat tube, and is capable of being slid backwards and forwards for adjustment of the chain. The chain connects the engine with a sprocket loosely mounted on the primary-shaft. The gearshafts are mounted on ball bearings throughout, and wherever a shaft

Combined belt and chain transmission is a feature of a new model two-speed Premier.

projects leather washers are fitted to prevent the egress of oil.

## A Multi-plate Clutch.

Probably the most novel feature of the gear is the clutch, which is of the multi-plate type and lies on the primary-shaft inside the gear box. It is operated by a neat toggle action, and ball thrusts are fitted wherever necessary.

Further than this we are not yet permitted to describe the clutch. The change of gear is effected by sliding dogs, mounted on a shell on the outside of the clutch drum, and moved by means of a striking rod and fork. (This is not visible in the sketch of gear). Outside the chain sprocket on the primary-shaft lies an 8in. adjustable pulley, from which the drive is conveyed to the rear wheel by a lin. belt. A starting dog is fitted to the pro-

**A THREE SPEED PREMIER.** This model has a new design dropped frame, permitting the removal of the cylinder without disturbing the crankcase, also Druid spring forks.

Clutch toggle actuating mechanism on the new change-speed Premier.

jecting end of the layshaft, and thus the starting handle is considerably geared up to the engine, making starting up easy. The standard gear ratios are  $4\frac{1}{2}$  and  $8\frac{1}{2}$  to 1, but by altering the adjustable pulley a low gear of 12 to 1 can be obtained. The operating lever for the gears is placed in a convenient position on the top tube. In future the chain drive will be entirely enclosed in an oiltight aluminium casing, part of which will be cast integral with the crank chamber.

## In North Wales on a 4 h.p. Sidecar.

**W**E recently spent a very interesting and enjoyable week's holiday driving a 4 h.p. Singer sidecar combination round the Wye Valley and North Wales. The outward journey was from Coventry *via* Ross, Hereford, Kington, Rhayader to Aberystwyth, along the coast to Aberavon, back to Dolgelly *via* Aberystwyth, Tal-y-llyn, and Cross Foxes, then to Bala, Corwen, Oswestry, Bishop's Castle, Ludlow, Cleobury Mortimer, Kidderminster, and Stratford-on-Avon to Coventry.

### Wet Monday.

A few notes regarding the roads and incidents of the route may be of interest to readers, also our experiences with the machine may be a guide to prospective purchasers of sidecar combinations. The second day was the never-to-be-forgotten "wet Monday" when Norwich was flooded out. The sidecar being stabled in a fine big coach house with cement floor and plenty of light, opportunity was taken to thoroughly overhaul it, not that it needed it, but it was something to do. How continuously it rained from morning till night! Many lanes in the neighbourhood of Ross were flooded, and one enterprising baker who endeavoured to reach his customers with horse and cart had to turn back when the water came up to the shafts.

Next day (Tuesday) was beautifully fine, and the run through the Pass of Plinlimmon was most enjoyable. The road surface, except in the neighbourhood of Pen-y-bont and Llangurig, was good. On the road to Devil's Bridge the little stream which crosses the road just beyond Castel Dyffryn was, owing to the rain, converted to a wide swift flowing torrent about eighteen inches deep in the centre. It was not worth wetting engine and magneto to get through this, as the bridge at Pont-Erwyd was only a mile or two further on. The road from Devil's Bridge to Aberystwyth is good, because visitors to the falls usually arrive by rail, but Aberystwyth to Aberavon is a Great Western motor 'bus route, and the surface of the road is execrable as can be imagined. The little port of Aberavon, once of far greater importance than it now is, is specially worthy of a visit.

Thursday's ride included the Corris Pass and the ascent to Cross Foxes from Tal-y-llyn. Both these climbs were easily negotiated on the low speed of  $8\frac{1}{2}$  to 1 with a combined weight of 23 stones—passengers and luggage. Chars-à-bancs run over this road and the surface in places has been badly broken up owing to the heavy traffic, for which the present road surface is quite unsuitable.

The mountain road from Dolgelly to Bala, especially for the first ten or twelve miles, was particularly lumpy, but it improved from Bala to Corwen. Just beyond Bala the road forks: both lead to Corwen, but the right hand is the better of the two. The main Holyhead Road from Corwen to Llangollen was two or three weeks ago in a very bad state. The pot-holes were filled up with loose flints which were scattered in every direction by passing traffic, but, of course, a light sidecar does not scatter the stones, and it is a very difficult matter to dodge these pot-holes, as they are so numerous and dotted about the road.

### A Good Route to Wales.

Friday's run home through Oswestry to Bishop's Castle was without further incident. This is a splendid road either in or out of Mid-Wales. The surface is far better than the Holyhead Road, and the hills are not severe. In addition, the scenery between Welshpool and Bishop's Castle and on to Ludlow is infinitely prettier than the Holyhead Road between Llangollen and Shrewsbury. Between Welshpool and Bishop's Castle the road is a little difficult to find—all signposts apparently point to Shrewsbury, and in Montgomery there are signposts at the cross-roads pointing to every place but Bishop's Castle and Ludlow. As a real matter of fact, the road does not go into Bishop's Castle, but it passes very

The two-speed 4 h.p. Singer sidecar combination.

close to it. As the route is a through one, and one of the best from the Midlands to Mid-Wales, it is surprising it is not better signposted.

At Ludlow we heard that the water was out near Tenbury, and were strongly advised to travel *via* Cleobury-Mortimer.

Never having ridden from Ludlow to Cleobury, the long uphill grind to the summit of the Clee Hill came as rather a surprise. However, the Singer combination tackled it successfully, and had it not been for a flock of sheep right across the road within 100 yards of the summit it would have been a non-stop.

Incidentally we may mention that the 4 h.p. Singer sidecar is a machine constructed on sound lines, with single-cylinder engine of  $88 \times 88$  mm., and on this tour no adjustments were required beyond those usually undertaken by tourists who wish to keep their machine in good running order while *en route*. A leaky petrol tank on the last day was the only *contretemps*.

Taking everything into consideration, we found the machine a reliable touring mount, and the air tubes of the Pedley tyres, a set of which were fitted to the bicycle, were never seen. The  $2\frac{1}{2}$  in. back tyre looks as good to-day as when the tour was started.

# CYCLECAR DESIGNS.

Chassis of the Roulette Cyclecar.

La Roulette tandem seated cyclecar.

## An Underslung Model.

THE above line sketches are of a new French cyclecar with underslung frame. The pressed steel frame is of channel section, and the front and back axles are steel tubes. The wheelbase is 7ft. 4in., and the track 3ft. 3in. Wire spoked wheels 650 x 60 mm. (26in. x 2½in.) are used, and ring ball bearings are fitted on the axles. The front suspension consists of double springs, which ensure very comfortable riding. The engine is a twin V-type 8-10 h.p., 85 mm. x 95 mm., with natural water circulation, vertical tube radiator, automatic carburetter, magneto ignition, and

## The Super Cyclecar.

A week or two ago we published an illustration of a useful looking cyclecar, the Super, and we take the present opportunity of giving a few details about this interesting little machine, which is being placed on the British market by E. Jozot, 59-61, New Oxford Street, W.C. Three features deserve particular attention. Firstly, it is designed to be steered and driven from the front seat; secondly, a water-cooled engine is used; and, thirdly, the steering is positive by rods, no wires being used.

The two cylinders of the V-type 8-10 h.p. Anzani engine measure 75 mm. x 120

mm., and are water-cooled by thermosiphon circulation in conjunction with a small tube radiator, and a Clandel Hobson carburetter is used.

From the engine a chain transmits the power to a countershaft, whence from expanding pulleys on each side belts drive rims on the back wheels. The gear ratio of these pulleys is varied by a hand lever working transversely,

and to allow for the tightening or loosening of the belt as the gear is raised or

lowered, the back axle is secured to the ends of the back springs, which swing at their front ends on shackles, and at the centres are secured to arms by a rocking shaft that is inter-worked with the pulley expansion mechanism. To obtain chain adjustment, the engine setting is so arranged that the complete engine can be moved slightly backwards and forwards by a screw mechanism.

The petrol tank, placed at the top of the driver's seat-back, holds three gallons of petrol, and, while well out of the way, is very accessible. The writer spent a most interesting afternoon on one of these cars, which, while it had good acceleration and speed capacities, showed itself a wonderfully handy vehicle in traffic, the action of the brakes being particularly effective, not only in their powerful effect, but in the total absence of sideslip they caused. The hammock seats too proved exceedingly comfortable, and the body, which affords a very strong form of construction, also offers splendid shelter from the wind. At the moderate price asked, this vehicle ought to meet with instant success.

## A Cyclecar Wicker Body.

Thos. Mackenzie, of Bath Passage, Birmingham, is manufacturing a neat side-by-side two-seated cyclecar body. It is entirely carried out in basket work, and weighs only half a hundredweight. In spite of this light weight it is very rigid, and in view of the present popularity of cyclecars its future seems assured.

Side view of the Alvechurch cyclecar one of two new models made by Messrs. Dunkley of Alvechurch.

is started by means of a handle in front. The transmission is by chain, the constant tension of which is secured by a movable transverse counter-shaft. Three brakes are provided, one operated by pedal and two by hand lever. The rear brakes are on the lines of the old Bollée and Wolseley cars, viz., the wheels and axle are moved towards the fixed brake blocks. The accelerator is controlled by both foot and hand; the first is used for town driving. A pedal controls the clutch, one brake, and also alters the tension of the belts; finally, the same pedal moves the back axle forward until the brake drums meet the brake blocks on the frame. The body is furnished with a seat for the driver in front, and either one or two rear seats. If the driver's seat be at the back the two passenger seats are placed forward. The passengers' seats can also be placed side by side in front of or behind the driver. The total weight of this cyclecar, which is called La Roulette, is 3 cwt. 3 qrs. 20 lbs., and it is made by Monsieur Mazette, 45, Rue du Chemin de Fer à Courbevoie (Seine), France.

The French are particularly smart in designing these light belt-driven cyclecars, and there are a number on the road in the neighbourhood of Paris which have not yet been seen in this country.

Latest model of the 8 h.p. Arden cyclecar which has a new flush sided body, the magneto arranged above the cylinders, twenty-eight inch wheels, and other less important improvements.

## ABOUT TYRES.

By B. H. DAVIES.

I WANT to lay before economically-minded readers two or three considerations about tyres which several seasons of experimenting have impressed upon me. The first is the fact that costly tyres are the most economical in the long run. Most manufacturers fit as standard a light 26in.  $\times$  2¼in. type, which is listed at about 35s. per cover. These covers are so thin that they puncture very frequently on the back wheel; a pin, a tack, a bit of wire goes clean through, and stoppages are fairly numerous. Further, in hard go-anywhere work they sustain gashes; a sharp stone, a piece of glass, a large nail, a heel-iron, a sharp edge on a tramline or a level crossing, will cut the cover right through. These gashes do not admit of any lasting repair. They can be faked by inserting a gaiter, by internal patching, and the like, but the first gash sounds the knell of the cover. The rip extends, water enters and rots the fabric adjacent to the cut, and the tyre ceases to be trustworthy. If it be kept on the wheel there is danger of trouble at every succeeding mile. My experience with these tyres is that they are well enough on a front wheel, but that 1,000 miles about represents their average life on the driving wheel of a solo 3½ h.p.

### Heavy Covers.

Should the rider so elect, he can order his machine with a heavy cover costing upwards of 50s. on the driving wheel. My experience of such covers is that their average life on the back wheel of a 3½ h.p. solo is not less than 3,000 miles, and with good fortune they may wear for 4,000 miles. During this period they resist all small puncturing instruments, and only large nails find entry to the tube. It is no uncommon thing for such a cover to remain free from puncture for 2,000 miles, which is double the total life of most standard covers. In my experience the 50s. cover should wear, say, 3,500 miles, with, say, four punctures, whereas the 35s. cover wears 1,000 miles, with six punctures. Tabulating the contrast, I should estimate tyre experiences as follows:

Distance, 4,000 miles.

Four light standard covers, twenty-four punctures, three wheel removals—£7.

One extra heavy cover, four punctures, no wheel removals—£2 10s.

### The Question of a Non-skid.

In this connection a second point is vital. The all-weather rider dare not travel on plain treads. Heavy covers are made by some firms with treads excavated in very shallow corrugations. I have at this moment on both wheels of my 3½ h.p. machine a pair of strong and expensive tyres with treads consisting of shallow circumferential grooves. These grooves made admirable non-skids when the tyres were new. The covers have done 1,000 miles, and so far as walls and casing are concerned, they are equal to new, and promise perhaps 3,000 miles further running. But they have already ceased to be non-skids. The back tread is worn perfectly smooth, and my machine skids dangerously on wood paving lightly filmed with grease. The ribs have almost

vanished from the front tyre, and though it still retains slight non-skidding qualities it does not grip enough to correct the gyrations of the back tyre. There are two or three heavy covers on the market which are so deeply corrugated that they act as non-skids for upwards of 3,000 miles. Tyres of this design represent the maximum of economy and satisfaction. Shallow-grooved tyres of heavy construction are only fractionally more economical than the light standard types, since after 1,000 miles work they demand a fresh non-skid tread vulcanised on to the casing.

### Detachable Tubes.

My third point is the value of butt-ended tubes. I am not thinking of the relief from backache, derived from being able to take the tube out and repair it without stooping to the ground level. I find that sooner or later I send all my endless tubes away to be converted into butt-enders. Here is the history of two endless tubes supplied to me this year:

No. 1. During a competition this tube developed a small leak. I never had the chance to test it with water, and grew tired of blowing it up every fifty miles. Finally I cut it out and inserted my butted spare; I found the leak in water, and sent the tube away to be butted. This trouble would have been avoided if a butted tube had been originally purchased, and I should have saved 2s. on the job as well.

No. 2. A second tube behaved similarly, and was cut out. When tested in water I found two minute blowholes, both situated within quarter of an inch of the edge of an old patch. I should have saved another 2s. had I bought a butt-ender originally.

F. Jones, of Liverpool, with his 3½ h.p. Bradbury. The dog jumps on the back of the carrier every morning and goes to business with his master. At night he returns in the same manner and always looks for the chance of a ride during the day. The dog is not in any way enticed on to his insecure seat.

## Birmingham to Coventry and Brooklands.

**M**OTOR cyclists in the Midlands are constantly riding to and from Brooklands track either to compete in races or to witness others taking part in the numerous events which are held on this famous motodrome. I am aware that almost every rider has a pet route of his own, but having found the one described below better than others I have traversed. I have sketched a map of the course followed and append a description, which may interest others. The following may be improved upon, but will be found free from traffic and ten-mile limits, good surface, and fairly easy to find. Distance about 100 miles.

Coventry, Banbury, and Oxford are too well-known to require description. Out over Magdalen Bridge (Oxford) and Iffley Road. Through Nuneham and old-world Dorchester, and on to Benson, where take a very sharp scissors turn right. It is much sharper than a hairpin, and may easily be overshot. Then over Nettlebed, with the well-known golf links, and shoot down into Henley, leaving Arms Hill a few miles to the left.

Cross the Thames and up White Hill. At the top ignore the Royal Society for Prevention of Cruelty to Animals' notice board, and keep straight on over a picturesque and undulating road with many blind corners, where "dead slow" is only judicious. Up over sporting hills and we run through Maidenhead Market, erstwhile beloved of the High Toby man, on to the Bath Road, and keep left for Maidenhead. As we trickle gently down the hill a ten-mile limit post heaves in sight. Almost immediately we turn right and

going under the railway bridge look out for the Windsor turn, left, after a long brick wall. This road has recently been re-made and has splendid surface. In the early morning time can be saved along here; later in the day it is advisable to move circumspectly. Soon Windsor Castle towers in the distance, the last few hundred yards through the meanest of mean streets, which we wonder are tolerated so near a Royal residence. - A sharp turn right and swinging round the castle on a steep hill laid with large but fairly smooth stone setts, we cut across Long Walk. Before long we see the Thames, and a signpost—Egham and Staines Except at High Water—so, keeping right up a long rough hill with a very loose surface, we come out on a pleasant common, and keeping left are soon running down the hill into Egham. The turn right for Thorpe should be enquired for. The twisty and bad surface gravel road is well signposted. Running through the village of Chertsey, we turn sharp right for Weybridge, and are soon riding up the hill towards the track.

When the river is normal keep along the towpath at the high water post. A romantic run past Runnymede and Magna Charta Island brings one out on the Southampton Road a mile out of Staines. Turn right at the bridge and right again down Chertsey Lane—very loose or deeply mired according to the weather, and you pass through Chertsey main street and join the previous route.

On a fine day it is a jolly run, the riverside view being a big change for the Midlands rider. It should be just possible, by making an early start, to get there and back in the day and see the racing, but rather strenuous.

There are, of course, many other ways, but they are anything up to twenty miles further. The main Oxford-London Road should be avoided, as from Wycombe to Uxbridge it is bad surface, towny, and there are ten-mile limits. I have also tried the Holyhead Road to St. Albans, but the suburban roads through Watford, Rickmansworth, etc., are very slow and tiresome.

V.A.H

The winning Bath Motor Cycle Club team in the inter-club trial held recently between this club and the Bristol M.C.C.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### Cornering in Cyclecars.

Sir,—If "Ixion" has still any doubts about cornering on cyclecars, we shall be very glad to give him a trial on a G.N. that will entirely convince him. We will guarantee that we will take him or anyone else in doubt round the worst hairpin he can find at a far greater speed than any motor bicycle will take the corner. "G.N." LTD.

#### Road Shocks.

Sir,—Being a constant reader of your paper I have gained much information therefrom, but I have failed to notice any reference to inconvenience to motor cyclists by reason of "road shock" caused by uneven roads. To me this is the chief drawback to motor cycling. I find that travelling at a fair speed I receive so many bumps and jars that after about thirty or forty miles I have had about enough of it. My machine is a new one—2½ h.p., twin-cylinder, two-speed, and one of the best on the market. I will be thankful to any of your readers who can advise me how to obviate the discomfort I complain of, either by means of saddle or shock absorber or both. SENEX.

#### Warning Signs.

Sir,—I was interested to read the article on "Warning Signs." I have frequently noticed how useless some of them appear to be.

Some months ago I was out for a ride and passed several triangles which seemed out of place; then, when passing another, I nearly came to grief, as the road turned to the left and practically doubled back on itself. As it was, I just got round, but if anything had been coming the opposite way, I should most certainly have collided with it.

During the same ride, if I remember rightly, I came upon some rather similar corners which had no sign at all.

R. A. BATTSON.

#### Petrol Consumption.

Sir,—I believe there was a discussion in *The Motor Cycle* a short while ago about the mileages made by various motor cycles on a gallon of petrol.

It may be of interest to your readers that in August last I left Cardiff with one gallon of petrol in my tank for Fishguard. At Neath I missed the correct road and managed to wander round through Pontardawe and Ammanford to Llandilo. From here I used the road to Carmarthen, through Newcastle Emlyn, Cardigan, Newport, and so to Fishguard. Without refilling here, or having refilled at any point in the run, I returned to Newport, Pem., and even then had a fraction left in the tank. According to Bacon's map this makes up 130 miles. My machine is a 3½ h.p. Triumph, and that day I used a .032 jet. GETHIN DAVIES.

#### The Cyclecar Nothing New.

Sir,—In your issue of the 5th under the heading of "Another New Cyclecar" you gave a description of our new engine with illustration of complete car. It has occurred to us that those who have only recently become subscribers to your valuable paper may be misled into the belief that we have only just commenced manufacturing cyclecars, whereas you may remember that you published a description of our machines in 1910, from which we received about 700 enquiries. We shall be glad if you will publish this to prevent any possible misunderstandings. G.N., LTD.

#### Belt and Chain Transmission.

Sir,—I have followed with great interest the recent correspondence of chain and belt drive. Mr. Wyatt's experiences fill me with alarm, as I am anxious to take a machine out to India, which will not give me the trouble he has experienced with a belt drive.

Would a shaft drive be the best for India? An officer at this station (Tralee, Co. Kerry) has a F.N. (shaft drive) which he used for five years abroad without a day's trouble on this score. NOVICE.

Sir,—Re Mr. E. K. Wyatt's letter in your issue of the 5th inst., regarding belt-driven machines.

I have owned seven machines, all belt-driven, and have never experienced any trouble with them. My latest is an 8 h.p. Zenith with Canoelet sidecar, total weight with passenger and self 6 cwt, without luggage. On August 13th we rode to Wetherby from London, thence on successive days to Alnwick, Edinburgh, Ambleside, Chester, Stony Stratford, and back to London. Although it rained for three days I had no sign of belt slip, and during the whole journey broke one fastener only. This I cured by using an Amac. We climbed Kirkstone Pass in pouring rain with full load. The belt used was the 1in. round top Dunlop, the total mileage of which is 1,566. W.C.K.

Sir,—I feel sure that there must be many motor cyclists like myself who have not had such unfortunate experiences with our belts as our friend Mr. C. K. Wyatt. Undoubtedly the method of driving has a lot to do with the life of a belt in the same way that it affects the tyres, the strains having to be put upon the belt before being transmitted to the road via the tyres. Now, I am twelve stones, and ride a machine that scales a little above the average 3½ h.p. standard weight, but up to the present belt troubles have been too slight to worry me.

At the beginning of this year I purchased my present mount second-hand, and on it was fitted a 3in. Whittle belt, with which I had not had any previous experience. This belt had been in use some time before the machine was sold to me, and, although I have done over 1,000 miles on it (in-

A NEW MODEL OF NEAT DESIGN.

The 3½ h.p. Diamond. This machine, as will be seen, has a two-speed gear, overhead mechanically-operated inlet valve, and chain transmission. It is being marketed by the Diamond Engineering Co., Wolverhampton.

cluding some good hills and speeds), the wear is practically nil, and I have never yet been held up with belt trouble.

I take it down every 300 or 400 miles, and apply (after cleaning) the Whittle belt dressing. This operation takes about one hour, and if performed in the evening the belt is ready by the next morning, and I guarantee that there will never be any belt slip if this course is pursued. Before Mr. Wyatt goes in for a plain chain drive machine, I suggest he tries a leather belt, which, given proper attention and fair usage will ensure a pleasant run, free from this trouble.

CHAS. G. HUNTLEY.

#### Motor Cycle Taxation by Horse-power Rating.

Sir,—Seeing the paragraph in the last issue regarding taxation, I feel led to protest against such a proposal as being unfair and out of all proportion. I ride a 7 h.p. motor cycle (and sidecar occasionally with wife and child). In spite of the arguments *re* horse-power rating, it is obvious to me that a two or three-wheeled motor cycle vehicle does not cause the wear and tear on the road as a small motor car, even though the horse-power of the former may be slightly higher. Then again, it must not be forgotten that there has been an increased demand for higher powered motor cycles the last two seasons because of the increasing popularity of the sidecar, and the necessity for higher power is obviously greater in the case of a motor cyclist having a wife and small family. If they are to share in the pleasure, as they naturally should, it must be borne in mind that he is not only put to more expense in having to procure a machine of increased horse-power, but that he is also contributing much more to the national exchequer by the tax on his petrol.

I cannot see anything but selfishness behind the above proposal, and—one thing I am sure it would most certainly do if it were adopted as law—it would deprive my wife and child of what is to them one of the best means of enjoyment and adjuncts to health, for I certainly should be compelled to sell my present mount and purchase a lower powered one, thus having to do away with the sidecar, for I could not stand a three guinea tax.

I trust no time or opportunity will be lost by those concerned in lodging an emphatic protest against what would be nothing less than a most unjust and wicked imposition.

T. ENDERBY.

[The members of the Motor Cycle Manufacturers' Union are contemplating calling a meeting to consider the question of protesting to the Treasury against the proposals of the committee.—Ed.]

#### Sidecar Design.

Sir,—I shall feel obliged if you will allow me a few lines in the interests of my fellow sidecarists to call attention to a, to my mind, unsatisfactory kind of fitting in use, I believe, with many kinds of sidecars, and not entirely confined to the cheap variety either. I refer to the telescopic fitting which slides into a split tube, which is secured at the end by a metal band, tightened, to close the tube, by a bolt and nut.

Unfortunately, I write from experience of the defects of this method of adjustment, having sustained a breakdown recently which might have had very serious consequences. As it was, the passenger (my father) was rendered unconscious, and is still suffering from severe injuries to the head and

J. I. E. Emerson, of Hull, who scored a runaway win in the Brooklands 150 miles T.T. race. He rode a long-stroke Norton, and annexed three world's records during the ride. His average speed was nearly 64 m.p.h.

hands, while the damage to the machine will certainly cost not much less than a £5 note to make good.

In my own case, and probably in others, it appears that the metal band becomes somewhat bent after being used a few times, with the result that the ends of the band meet without thoroughly binding the tube underneath it, and consequently there is a liability for the telescopic tube to slide either in or out, especially when any strain, such as turning a corner, is put upon it.

In the accident mentioned, the back connection came right out and let down the sidecar, causing a similar "list" on the cycle in the opposite direction, which prevented steering, and as a consequence it mounted the pavement, struck a tree and a wall, and threw out both passenger and driver, with the result previously stated.

For the future I shall use a non-adjustable connection (an adjustable fitting being unnecessary after the machines have once been put in true alignment), and if a telescopic fitting be used it will be secured by a screwed bolt passing through both inner and outer tubes and locked by a nut on the other side.

Sidecarists using the first-mentioned type of fittings will do well to see that they are quite firm. Even then, after my experience with them, I would not like to guarantee safety, the connections on my machine having been tested thoroughly only just before starting out.

WALTER S. LEWIS.

[We have always found the clip in question hold well if properly screwed up, but there are clips and clips. Perhaps our correspondent has a poorly made one. His remarks might, and do, apply equally to handle-bar clips, but one seldom hears any complaints regarding well-made ones.—Ed.]

A group of members of the Cowbridge and District M.C. (Glam.) taken on the occasion of the recent hill climb.

### What is a Cyclecar?

Sir,—It is really extraordinary what a distorted idea some manufacturers have of a cyclecar. They produce a vehicle that resembles a 40 h.p. Rolls-Royce viewed through the wrong end of a telescope, and dump it on the market as a cyclecar!

The very presence of the adjective "cycle" seems to me to demand that the car be built on cycle lines, therefore I hold that the machine should have a tubular frame, four cycle wheels, and usually an air-cooled engine, which should not exceed 8 h.p. The nature of power transmission should be such that a differential gear is excluded, and, above all, the price of the complete turnout must be kept lower.

The present tendency to overdevelop the cyclecar will inevitably cause its disappearance, and that would be a pity.

CHAS. H. GOULDEN.

[Most people hold different views on the subject, but, while the R.A.C. and A.C.U. definition remains what it is, a cyclecar is any vehicle weighing under 7 cwt. unladen; many alleged cyclecars weigh more. Our correspondent seems to lose sight of the fact that some manufacturers prefer to build their vehicles on well-tried lines, others prefer to experiment. The whole question resolves itself into one of price, and time alone will show the correct lines to be followed. In the meantime, he who pays the highest price will probably get the best article.—Ed.]

Sir,—In answer to Mr. Rowland's letter of September 12th, I see no reason why the Singer machine should not be termed a cyclecar. One can make a cyclecar either by working backwards from a car or else forward from a motor cycle. It will be a case of the survival of the fittest, and that type will succeed which best fits the demand. Until then let all machines falling within the A.C.U. definition have a fair fight, with no backbiting from those who think they have already solved the problem to the general satisfaction of the public.

A. T. GRANGE.

### Combined Belt and Chain Drive.

Sir,—As one who has consistently advocated the change-speed gear in the counter-shaft, chains to the gear box, and belt to the back wheel, I am beginning to think that the matter requires no more proof. I have from the beginning urged this upon Messrs. Douglas, and the proof of the pudding is in the eating. For over 20,000 miles I have driven this combination, in which time I have used four belts, including that now in use. The last, a Dunlop, has been on since February last, and is still good. Owing to changes in the gauge of chains I have not run any one chain over 5,000 miles, but never had to change a chain because it was worn out. My belt and chain are, however, efficiently mudguarded. This is the secret. Chains open to the weather are equally impossible.

Now, the complete chain drive necessitates some form of shock absorber. The rubber belt fills the bill better than any other form and with less loss of power. It is a spring as well as a slip; in fact, the slip part is negligible. I do not know who Mr. T. F. Maw is and what his experience of belt-cum-chain is. I only know that I use my machine day and night over roads, and lanes, and field tracks to the tune of about 10,000 miles per annum, and I am riding the same Douglas that I originally purchased from the firm in March, 1909. As a single-speed, belt-driven, with a cotton-reel pulley in the winter it was never perfectly reliable, but now with the combined chain-cum-belt I go anywhere and at any hour with ease and comfort to myself. Mr. Maw says we have not had a proper trial of chain drive. It has been fitted to my personal knowledge to motor bicycles for the last ten years and shaft drive for the last six. I will make a shrewd forecast that Olympia will show the astonished motor-cycling public what the experts think of the matter now.

CHARLES L. PATTERSON, M.B., M.R.C.S.

### Tyres.

Sir,—Re letter on tyres by one of the "Roadside Solutioners" in your issue of September 5th, I wish to give you my experience, and I am only a novice, this being my first year at motor cycling. I bought a Clyno and sidecar, and my total mileage up to now is 3,474, and I have not had a puncture. I have been over some of the worst roads in Devonshire, after doing over 2,900 miles—the road from Lynton to Simonsbath and, Challacombe, until you meet the main road to Ilfracombe, being particularly bad.

I had a 26 x 2½ in. Kempshall non-skid fitted to the driving wheel, and the usual Palmer cord tyres which the Clyno fit as standard on front and sidecar wheels. I decided to enter the Birmingham M.C.C.'s run to Carlisle and back, and at 3,197 miles I took the Kempshall off the back wheel and have fitted another of the same make, and for safety I took the Palmer cord off the sidecar wheel, and have fitted a 26 x 2½ in. Pedley, of which I have heard some excellent accounts from private owners.

Of course, I know I am fortunate in not getting a puncture, but no doubt the tyres have had a little to do with it, and I agree with "Roadside Solutioner" that most motorists are quite willing to pay a good price for a good tyre, and I shall have a 26 x 3 in. tyre fitted to my driving wheel when I require another; and also tyres would be all the better if made stronger at the bead. The Kempshall I have taken off I should think would do another three to four hundred miles, and the Palmer will do more.

R. HADDOCK.

### Wayside Petrol Vendors.

Sir,—One day while being supplied with some motor spirit by a small wayside dealer in one of our villages I was very impressed with his lament: "So very few cyclists ever call for petrol that I sometimes think whether it is worth while taking the trouble to supply it in less quantities than a whole tin." Now, sir, if we only exercised a little thought, it is quite patent that these small dealers are a great convenience and should be patronised as often as is possible, provided that the charge is the ordinary market one.

## THE MOTOR CYCLE IN THE ARMY MANŒUVRES

Again the value of the motor cyclist as a despatch rider and scout has been demonstrated, and universal praise has been accorded to the motor cyclist sections and their mounts. The pride and care with which the machines were prepared for the recent manœuvres is proved by the fact that several teams ran throughout the manœuvres without an involuntary stop. Sir John French (the Inspector General) personally complimented a number of the leaders on their valuable work.

Motor cyclists played an important part in the manœuvres. Our photographs show: (1) Red Cross men giving lemonade to a thirsty scout, who is astride a Premier machine. (2) Field telegraph office and general staff. The car is used for the telegraph and maps can be seen on the mudguards and wind screen, with officers awaiting news from a scout who has just arrived on his Torpedo-Precision. (3) On the battlefield. A group of scouts and despatch carriers' motor cycles in readiness for messages. (4) Early morning refreshments on the road. (5) Discussing the way the fight is going and by which route the enemy are coming. (6) An officer consulting the map as to the most probable way the invaders will advance, a motor cyclist scout having just arrived to report having sighted the enemy.

# Tandem and Sociable-seated Cyclecars.

A French and English production both with water-cooled engines.

## The Automobilette.

**T**HIS cyclecar, which is of French origin, is made in two patterns; one has a single-cylinder, the other a twin-cylinder engine. The chassis is very low and long, and is therefore very stable. The lightness is secured by doing away with gears and superfluous parts.

The chief aim in building these cyclecars was to use one organ for several purposes, and to make the frame very light and strong.

Water cooling has been adopted, not to obtain excessive speed, but a speed that would not decrease appreciably when climbing long hills. The change of speed is obtained by a variable pulley movement, giving three different speeds.

The Automobilette is to be guaranteed for one year. The chassis is of armoured wood, and tubular axles are used. The tyres are Michelin's 650 x 65 mm. The front is suspended on a long spiral spring, whilst laminated springs are used at the rear. The control is by aluminium steering wheel, and bobbin and cable. Transmission is first by Renold chain then to the rear wheels by belts. The brakes are four in number. Two actuated by pedals work on the wheel drums; two others, controlled by a lever, act on the rear pulleys. A Bosch magneto and Claudel automatic carburettor have been adopted. Lubrication in the single cylinder type is by drip feed, but the twin has forced lubrication. The weight complete is given by our Paris correspondent as 440 lbs. The single-cylinder type is rated at 6.8 h.p., bore and stroke 80 x 130 mm. The two-cylinder model is of 9 h.p., 70 x 130 mm. bore and stroke.

## The L.E.C.

A newcomer into the cyclecar class is the L.E.C., which is sold by the New Phonophone Telephone Co., 31, Budge Row, E.C., and is made throughout at the company's works at Southall. The

Automobilette, a French tandem seated cyclecar which is said to scale under 4 cwt.

engine is a two-cylinder, vertical, water-cooled, 80 x 108 mm., and the water pump and U.H. magneto are chain-driven. The radiator is of the multi-tubular type, and in external appearance resembles a Daimler. The carburettor is the Lukin, and the lubrication is on the gravity drip system, keeping a constant level in the crank chamber, the engine being lubricated entirely by splash. The clutch is of the leather-to-metal type, the clutchshaft being provided with the usual universal joints between it and the gear box. The latter is of the three-speed sliding type, the ratios being 4, 8, and 13 to 1. The gear box contains a differential, and

there are cross-shafts carrying pulleys, the final drive being by belts, which are partially protected by means of guards. This system, we understand, will be done away with in favour of a live axle. The belts are 1½ in., of Service make, and the frame is of channel steel, suspended on semi-elliptical springs in front and Lanchester type springs at the rear. The steering is by rack and pinion. 700 x 75 mm. tyres are fitted. The control is by hand throttle on the steering wheel. The magneto advance is on the dashboard. The brakes consist of two belt pulley brakes worked by the side lever, and the propeller-shaft brake by pedal. The coachwork is decidedly smart, and the body is of pleasing appearance. The petrol tank, which is cylindrical, is carried behind the back seats.

## A NEW SPRING FORK.

A spring fork has been invented and provisionally patented by Mr. A. Hayes, the special feature of which is that provision is made for absorbing both vertical and horizontal shocks, a separate spring being used for each purpose. If, however, a violent shock of any nature should be caused, both springs come into action at once. The fork is neat to look at, and weighs approximately the same as other spring forks on the market.

The L.E.C., a water-cooled engine cyclecar with a Daimler pattern radiator.

A 90° twin cylinder air-cooled J.A.P. Engine specially designed for cyclecars. The position and accessibility of the magneto will be noted.

### 90° J.A.P. Cyclecar Engine.

The photograph reproduced herewith is that of a new 90° J.A.P. engine, built specially for cyclecars. The principal feature about it is the overhead mechanically operated inlet valve placed over the exhaust and operated by a long tappet rod working through a lug cast on the inlet pipe; the rocker is carried on a bearing cast on the dome. The magneto is placed between the two cylinders and

Exterior view of the new Premier countershaft two-speed gear.

driven by chain. Strong double magnets are provided to enable easy starting without gearing up. The nominal horse-power is ten, but the engine gives considerably more on the brake. As most readers know, the 90° twin gives a better balance than a four-cylinder engine, so that the makers, J. A. Prestwich and Co., Tottenham, N.W., should experience a considerable demand for this engine from cyclecar-manufacturers.

### T.M.C. 1913 Developments.

We had recently an interesting talk with Mr. Kirschbaum, the managing director of the Wilkinson T.M.C. Co., Ltd., Oakley Works, Southfield Road, Acton, W., regarding the company's programme for 1913. Among the models to be taken up for next year will be a new cyclecar, fitted with the 7 h.p. T.M.C. engine, 60x75, which is fitted to the sidecar model. It will have three speeds and reverse, propeller-haft drive, and differential.

The latest pattern T.M.C., which, in future, will be sold only as a sidecar combination, has been slightly altered as regards the design of the back tank, and a new starting arrangement, consisting of a pull up handle attached to a rack which meshes with a free wheel on the main shaft, is fitted and works admirably. The Stewart-Precision carburetter is now

standard. The machine is fitted with a most comfortable sidecar, sprung in the same manner as the T.M.C. machine, on parallel leaf springs. We were given a short run on one of these machines, and could almost bring ourselves to believe we were seated in a high-class car. The engine runs without vibration, is capable of quick acceleration, and the riding is most luxurious. An improved honeycomb radiator is now fitted.

### The Wooller Two-stroke.

A new departure will be the taking up of the Wooller motor bicycle, an inter-

Phoenix sidecar chassis, showing telescopic luggage grid.

esting two-stroke machine which created a great deal of interest at the 1911 Motor Cycle Show. The present engine has a capacity of about 250 c.c., but the new model will be enlarged to 350 c.c. Since its appearance at the show the machine has not undergone any startling changes, except that a compression release valve has been fitted. The machine, it will be remembered, has a double-ended piston

Adjustable footrests on the new Premier

and blank-ended cylinder. The gudgeon pin projects through slots in the cylinder walls, and carries at each end a connecting rod to the crankshaft. The lubrication is by oil pump, which throws jets of oil on the big ends and other working parts, while an outside pipe delivers the oil to the piston. The change-speed gear is of the expanding pulley type; one pedal expands the pulley and the other serves to contract it. Provision is made for taking up the slack in the belt.

The latest model four-cylinder T.M.C. sidecar combination which has a water-cooled engine.

## AMULREE HILL CLIMB, ORGANISED BY THE EDINBURGH &amp; DISTRICT M.C.

(Referred to on page 1070 of our last issue). 1.—A competitor between the bends. 2.—Breaking the thread controlling the electrical timing apparatus.

## RESULTS OF AMULREE HILL-CLIMB.

The following results of the above open hill-climb, held on the 16th inst., have just come to hand:

Class I. (novice handicap) was abandoned

CLASS II. (up to 350 c.c.).

Rider and machine.	Time.	Secs.	Fig. of merit.
1. A. H. Alexander (2½ Douglas) ...	76.8	...	3,051
2. A. U. R. Downie (2½ A.J.S.) ...	85.8	...	2,793
CLASS III. (handicap, 351 to 550 c.c.).			
1. A. H. Alexander (3½ Zenith) ...	66.8	...	2,927
2. A. F. Downie (3½ Ariel) ...	75.8	...	2,735
3. C. H. Macmillan (3½ Scott) ...	96.8	...	1,945
4. R. A. Macmillan (3½ Scott) ...	123.2	...	1,507
5. O. G. Braid (3½ Indian) ...	*121.0	...	1,356
6. — Dodds (3½ Singer) ...	*127.6	...	1,217

Class IV. (handicap, 551 c.c. and up) was abandoned.

CLASS V. (scratch, up to 550 c.c.).

1. A. H. Alexander (3½ Zenith) ...	66.6
2. O. G. Braid (3½ Indian) ...	67.8
3. A. F. Downie (3½ Ariel) ...	77.4
4. C. H. Macmillan (3½ Scott) ...	94.4
5. R. A. Macmillan (3½ Scott) ...	122.8
6. — Dodds (3½ Singer) ...	*131.8

CLASS VI. (unlimited scratch).

1. J. R. Alexander (7-9 Indian) ...	58.4
2. R. S. Morrison (5-6 Bat) ...	63.4
3. A. H. Alexander (3½ Zenith) ...	68.0
4. — Dodds (3½ Singer) ...	78.8

Class VII. (passenger handicap), result not decided.

CLASS VIII. (restarting test).

1. A. H. Alexander (3½ Zenith) ...	80.0
2. O. G. Braid (3½ Indian) ...	91.6
3. R. S. Morrison (5-6 Bat) ...	98.0
4. C. H. Macmillan (3½ Scott) ...	106.0
5. A. F. Downie (3½ Ariel) ...	110.0
6. C. McGregor (2½ Douglas) ...	119.4

\* These times include 45s. penalty for assisting machine.

## BROOKLANDS MEETING on Saturday.

On Saturday next, the 28th inst., the Brooklands Automobile Racing Club has included a motor cycle race in its programme. The particulars and entries are as under:

2.25. The Twelfth Short Motor Cycle Race (a handicap). About 5½ miles. Prizes: £10, £5, and £3, or cups at option. For all classes of motor bicycles.

Bore and stroke

G. Roberts (1 cyl. Rudge) ...	...	85 × 88
R. L. Keller (1 Triumph) ...	...	85 × 88
G. E. Stanley (1 Singer) ...	...	85 × 88
J. Cocker (1 Singer) ...	...	85 × 88
J. A. Manners-Smith (1 Triumph) ...	...	85 × 88
H. H. Square (1 Robin-Minerva) ...	...	69 × 69
D. Lavender (1 Rudge) ...	...	85 × 88
B. C. Remington (2 Matchless) ...	...	90 × 77½
Sydney Hall (1 Rudge) ...	...	85 × 88
L. Hill (1 Rudge) ...	...	85 × 88
W. H. Elce (1 Rudge) ...	...	85 × 88
F. Bateman (1 Rudge) ...	...	85 × 88
W. Stanhope-Spencer (1 Rudge) ...	...	85 × 88
E. W. Russell (1 Rover) ...	...	85 × 88
A. G. Walker (1 Rudge) ...	...	85 × 88
Harry Martin (2. Martin) ...	...	76 × 55
Harry Martin (1 Martin) ...	...	85½ × 59½
F. A. McNab (2 Douglas) ...	...	60 × 60
F. H. Arnott (1 Rudge) ...	...	85 × 88
F. H. Arnott (2 J.A.P.) ...	...	90 × 77½
Clifford Pressland (1 Rudge) ...	...	85 × 88
S. F. Garrett (1 Green-Precision) ...	...	85 × 88
W. A. Jacobs (1 Singer) ...	...	69 × 80
S. L. Bailey (2 Douglas) ...	...	61 × 60
J. P. le Grand (1 Singer) ...	...	69 × 70

The Swan sidecar illustrated above has a frame of square section steel tube and is very strong and light. The body is suspended on coil springs. It is the product of the Midland Motor Co., Cowley Road, Oxford.

# OPEN 24 HOURS' TRIAL.

Birmingham to Carlisle and Back.

**Q**UITE a crowd assembled at the Birchfield Motor Works, near Perry Barr, on Friday evening last to watch the competitors start on their 400 miles run to Carlisle and back. Inside the garage the machines were arranged in rows in order of starting, and the competitors were busy with finishing touches, and putting on oilskins, gloves, etc., for though the night was fine there was a chill in the air reminiscent of winter.

Arriving in good time, we strolled round the competing machines, and though most of the preparations made for long distance competitions have become more or less common, there were a few interesting fittings to be seen. Fern had a very neat idea for fixing his generators, which consisted of a Lucas forked lamp bracket fixed to the down tube of his Humber, each fork of which supported a Powell and Hammer generator in the usual P. and H. manner. The fitting is so extremely neat and simple that it is a wonder that no one has thought of it before.

F. Hill faced the starter on an A.C. Sociable, but was not allowed to take part in the trial, as he was unable to procure a passenger. This was hard luck, as the performances of passenger machines are always watched with interest.

Woodhouse was riding a 4½ Regal-Precision fitted with the G.H. counter-shaft gear. He had attached to his machine a very novel sidecar, which is the production of Smith and Woodhouse. The frame of the sidecar, instead of being parallel to the ground, slopes upwards to the front frame fixing, thus avoiding a bent fixing tube and giving a good straight pull on the axle. The body fitted was very long and low, and the passenger lies almost flat. This sidecar has been designed for Brooklands.

Begley pointed out the extra heavy spring fork links fitted to his Hazlewood, which point will be standard on all the new models.

## The Start.

Punctually at 10 p.m. the doors of the garage were opened and Egginton (New Hudson sc.) and Wintle (Rollo) were sent off. The former stopped almost immediately, but got going again. From the sounds we should guess the trouble to have been a fouled plug.

There were eight non-starters, leaving a field of forty-six. Miss Hough started (No. 30), and was given a cheer as she glided away on her Scott sidecar. C. R. Collier had F. Whitworth as his passenger in the Matchless combination. Hugh Gibson (Bradbury and sc.), who was going through his own country, was thoroughly prepared for the run. R. G. Mundy was mounted on a new Rudge. The competitors were informed that there would be a check at the top of Shap and at Kendal on both outward and homeward runs. S. C. Perryman and Vernon Brook were both too busy with the organisation to take part in the trial, but their work was well repaid by the smartness with which the men were got away.

Trouble began early, for Woodhouse had the misfortune to break a chain a few miles from home. Unluckily the smash damaged his rear wheel, and he was unable to continue. Cocker (4 Singer sc.) suffered his usual hard luck and hit a bridge at Lancaster during the early hours of the morning, and though he and his passenger were not much hurt, his machine was effectively put *hors de combat*. Just before the ascent of Shap, Fenn's Armstrong gear control rod broke, the gear automatically went down to the low speed, and as he was travelling a fair pace at the time he was thrown forward on the tank, and the shock damaged his rear tyre. Many of the competitors chose routes of their own into Wigan, as there are several roads into the town. The Rollo, the only cyclecar in the trial, was reported to have valve trouble, and was seen being towed into Carlisle on return journey by a New Hudson sidecar outfit. Farmer's 2½ Calthorpe-Precision was going noticeably well, but unfortunately broke a valve and failed to get in to time. There were the usual crop of punctures, and Sheldon (Regal-Precision) retired at Preston on the outward trip for this reason, but rode home with the rest.

R. W. Duke (3½ Zenith) and H. J. Cox (2½ Forward) were the first pair to reach the finishing point, and arrived (as did all the survivors) covered with dust. Duke's machine was fitted with the new single lever control B. and B.

carburetter. Cooke (A.S.L.) reported timing trouble and a puncture.

Begley (3 Hazlewood) suffered his first puncture this year—a fine record for so constant a rider. Busby (Humber) was much troubled with punctures, and came in on a flat back tyre. Mundy, whose Rudge was still partly enclosed in its packing, had a no-trouble run, and his Steeastic tyres were untouched. Barnett (3½ Kynoch) was two hours late at Penrith, and so decided to retire.

Mogridge (3½ Mead-Precision) broke his exhaust lifter, but finished to time, driving on an extemporised fitting. Collier and Guest (Matchless sc.) had no-trouble runs, but Nott, who had ridden down from London for the event, failed to turn up within the time limit. Greaves (6 Enfield sc.), whose machine was fitted with the latest B.S.A. carburetter, turned up late, having suffered from punctures, and he had somehow lost his sidecar mudguard.

Sale (3½ Matchless) ran into a wall near Whitchurch, and Miss Hough, who had the misfortune to lose her way in the dark, pluckily finished amid cheers from the spectators, though, unfortunately, too late for an award.

## Official Results.

R. G. Mundy (trade, 3½ Rudge), ½ min. error, P. J. Evans trophy.

N. G. Blackwell (private owner, 6 Zenith), 1m., Motor Cycle Manufacturers' Union trophy.

C. R. Collier (7-8 Matchless sc.), 1m., P. J. Evans rose bowl.

R. W. Duke (3½ Zenith), 1½m., gold medal.

H. Ball (3½ Triumph), 1½m., gold medal.

E. Walker (4½ Monarch), 3m., gold medal.

V. Underhill (3½ Monarch), 6m., gold medal.

G. H. Alldays (3½ Alldays), 2m., gold medal.

J. H. Percox (3½ Alldays), 5m., gold medal.

R. E. Guest (7 Matchless sc.), 11½m., gold medal.

T. Pollock (3½ James), 5½m., gold medal.

W. Begley (3 Hazlewood), 14m., gold medal.

H. Gibson (3½ Bradbury sc.), 3m., gold medal.

S. A. Rowlandson (3½ Rudge), 1½m., gold medal.

F. Chidley (3½ Triumph), 16m., silver medal.

H. J. Cox (2½ Forward), 12m., silver medal.

P. Taylor (2½ Veloce), 16m., silver medal.

N. Steele (3½ Triumph), 24m., silver medal.

W. H. Egginton (3½ New Hudson sc.), bronze medal.

A. Johnson (3½ Alldays), bronze medal.

A. Young (3½ Kerry Abingdon), bronze medal.

V. Busby (3½ Humber), bronze medal.

G. N. Norris (3½ New Imperial), bronze medal.

A. G. Fenn (2½ Humber), bronze medal.

W. E. Cook (3½ A.S.L.) made an error of 17½m., but was disqualified on account of the noisy exhaust of his engine.

Tea, coffee, and refreshments were provided at the start by Messrs. Duke and Sarsons, the proprietors of the Birchfield garage.

A registered sidecar frame made by Smith and Woodhouse, Ltd., primarily for racing on Brooklands. It was used in the Birmingham-Carlisle Trial.

## NEW REX CYCLECAR.

Features: Friction drive, pressed steel frame, V twin water-cooled engine.

**L**AST week we examined the new Rex cyclecar which the Rex Motor Manufacturing Co., of Coventry, are building and will exhibit at the Olympia Show.

To commence our description of the chassis, which was the state in which we inspected it, we will begin with the frame. This is made of channel steel, and is underslung, the rear dumb irons being upturned at the ends and the rear axle passing across and above the frame. The rear springs are semi-elliptical, shackled at each end, and provided with tubular spring torque rods. Two cross members are provided and one longitudinal central member, also an inner frame of channel steel on which the engine and change-speed gearshaft bearings are carried. The front springs, which are flat and fastened to the inner frame members, project through the space at the end of the channel steel section and are attached direct to the tubular front axle. This narrows the width between the centres of the front springs, which are usually fitted to the main frame side members.

### Steering and Engine.

The steering pillar, which is very rakishly inclined, passes through the dashboard and also a hole formed in the right side of the radiator. The steering tube is connected by a ball and socket joint direct to the right-hand side stub axle lever, the steering centres being of the jaw type and the steering wheel of ample diameter.

The engine is a V-twin type water-cooled Rex, 84½ x 95 mm., with cylinders inclined at 48°, the crank case being attached to the inner frame by cradle plates as in motor cycle practice. The engine is identical with other Rex models so far as details are concerned, but the drive to the magneto, which is fixed on the left side, is by enclosed chain from the sprocket on the engine-shaft, so that

the magneto runs at half engine speed. A large diameter outside flywheel is also provided between the engine and the gear mechanism.

Large water pipes are led from the top of each combustion head to the top of the radiator; this latter is constructed of vertical gilled tubes arranged in the form of a flattened V with the apex pointing forwards, and water pockets, made of moulded brass, are formed all round the radiator.

The wood dash carries a hand oil pump by which the engine is fed; there is also a pressure fed drip lubricator, fed from an oil tank also on the dash and connected by piping to the shaft bearings of the friction drum and friction wheel, also the rear axle bearings.

We now come to the most important

part of the construction, namely, the friction-driven change speed mechanism. The engine is in front with crankshaft running in plain bearings, brings the friction drum well back behind the seating. The shaft is squared, in fact, it slides in an extension of the engine crankshaft so that by means of a long foot lever the drum can be withdrawn from the friction wheel against the pressure of a 400 lb. spring, so obtaining a free engine. If extra pressure be required to keep the drum against the friction wheel, a hand lever fitted close to the driver's left hand, i.e., in the centre of the frame, enables more pressure to be put on the spring. This, however, will only be necessary for restarting on a very steep hill.

View of the chassis showing engine in front and friction drive mechanism immediately in front of the back axle.

Front and rear views of the new Rex friction driven cyclecar, which is driven by a twin-cylinder water cooled engine.

**New Rex Cyclecar.**

The friction wheel is carried on a short shaft with plain bearings, which are supported on the ends of the two inner frame members, and the wheel is free to slide on a square of the shaft. The total variation in gear ratio equals the diameter of the drum, so that when the friction wheel is in the centre of the drum no driving takes place. Moving the friction wheel to the outer edge of one side of the drum gives the top gear forward ratio of the vehicle and the reverse forward ratio on the other. Movement of the friction wheel is effected by a hand lever suitably connected by short levers and rods which actuate a long forked rod taking its fulcrum from the rear

cross member of the frame. The friction wheel is covered with Raybestos, which is a mixture of asbestos and woven copper wire. The method of operating the gear change is to depress the pedal lever referred to while sliding the friction wheel transversely by the hand lever to the required spot on the drum to give the requisite gear ratio for the load and gradient. The final drive from the friction wheel shaft to the rear road wheel axle is by  $\frac{5}{16}$  in. roller chain. The rear axle is a solid steel shaft about 1½ in. in diameter; it runs in two plain bearings attached to the spring centres.

Both rear wheels are fitted with outside drum brakes, the bands being lined with Raybestos; they are operated by

pedal, and there is also another brake drum on the squared shaft of the friction wheel, actuated by hand lever. The wheelbase dimensions are 6ft., 6in. and track 4ft. 3in. The 26in. road wheels are wire spoked, fitted with 3in. Continental tyres.

One feature which should not be overlooked is that the underslung frame makes the ground clearance 7in., and none of the mechanism projects below the lowest line of the frame. This enables a flat undershield to be fitted running the total length of the frame.

The body is coachbuilt and roomy, and the usual cyclecar fittings, such as Cape hood, screen, etc., will be supplied to order.

**NEW B. AND B. CARBURETTORS.**

The greatest innovation in the B. and B. programme for 1913 will be the new automatic carburettor. Outwardly it resembles the two lever type, but a single barrel replaces the two. This barrel is forced downwards by a coil spring, and can be raised by the usual Bowden wire method. The wire, however, is not attached directly to the barrel, but to the jet cover (shown black in sketch). As the jet cover is raised it forces up the barrel against the pressure of the spring, and at the correct moment uncovers a second and then a third jet hole. These jet holes are all drilled horizontally into the main jet tube, and it is important that they should face the engine.

A long tube attached to the rear of the carburettor carries a clever compensating device for varying engine speeds. In the tube lie two coil springs. The one nearest the carburettor is parallel and just fits the bore of the pipe. The other is a conical spring, and is made so that in its normal position the coils touch and make a conical choke tube. The two springs carry between them a brass adapter tube. When the engine is running slowly the only air

Browne and Barlow's automatic carburettor. Note the spring balance gear in the air intake pipe.

to pass is that which flows through the adapter, but as the engine speed and suction increase the adapter is drawn towards the barrel, and this, by opening the coils of the coned spring, allows more air to pass.

We saw the carburettor on test in the firm's well equipped test shop, and tried

the device with and without the balance gear. We found that though the carburettor would work without it, the balance gear gave much quicker acceleration and in no way detracted from the maximum power.

The "universal" type will still be retained, but has been improved in detail. The size of the maximum jet has been reduced and the main air adjustment removed; the base of the barrel has also been recessed, which is found to make the carburettor less delicate to control. The standard model remains the same, but an extra model is made with what is known as a hooded jet. The jet proper lies at the bottom of a tube, which tube has a narrow slit down the side which faces the engine. This device is found to prevent the blowback of petrol in all throttle positions, except wide open.

**KILOMETRE RACE AT SPA.**

The above event, held on the 22nd, resulted as follows: 500 c.c. Class—1, Vernon Taylor (Rudge); 2, A. J. Dixon (Singer). Over 500 c.c. Class—1, Griffith (6 Zenith 85 x 76 mm.); 2, Janssens (7 Indian, 82½ x 93 mm.).

**CYCLECAR RECORDS BROKEN.**

On Friday evening last at 5 o'clock the 8-10 h.p. Bedelia made an attempt on and was successful in obtaining the fifty miles, one hour, 100 miles, and two hours' cyclecar records. The evening was fine, but there was a fair amount of wind. The first lap from standing start was made at a speed of 46.48 miles an hour. The fastest lap was the eighth, which was covered at a speed of 49.87 miles an hour. After this the speed fell away somewhat. At the end of the first hour 45 miles 504 yards had been covered, beating the machine's own record by 226 yards, and establishing a new fifty mile record in 1h. 6m. 29s. At the end of the hour a stop was made for replenishment.

On the completion of the two hours the distance traversed was 84 miles 600 yards, while the time taken for 100 miles was 2h. 25m. 20s. An interesting feature of the 90° Bedelia engine is the new Nilmelior magneto, specially designed for engines with cylinders set at this angle. The armature is stationary, while the pole pieces revolve.

### TIME TO LIGHT LAMPS.

Sept. 26th	...	...	6.49 p.m.
" 28th	...	...	6.45 "
" 30th	...	...	6.40 "
Oct. 2nd	...	...	6.36 "

### Saturday's Open Trial in the North-west.

The route selected for the Liverpool A.C.C. open trial on Saturday next, the 28th inst., embraces several severe climbs. Starting from Birkenhead (Hamilton Square at 8.30 a.m.), the route is *via* Queensferry, Caergwile, Bwlchgwyn, Ruabon, Llangollen, Horse Shoe Falls Pass (old road), Corwen, Bala (lunch), Festiniog, Blaenau, Festiniog, Bettws, Llanrwst, Llangerniew, Llanganuan, Denbigh, Caerwys, Mostyn, Holywell, Penybally, Holywell, Flint, and Queensferry (finish).

### Climbing the Great Orme.

The Mersey M.C. held a non-stop run to Llandudno on the 22nd inst., and the two prize winners, F. C. Jones ( $3\frac{1}{2}$  Zenith) and V. E. Horsman ( $3\frac{1}{2}$  Singer), afterwards rode on the tramway track up the Great Orme, a climb of about five-eighths of a mile, including two stretches of 1 in  $3\frac{1}{2}$ . These two riders were the only ones to make the ascent at the first attempt.

This is not the first climb up the Orme, several motor cyclists having made non-stop ascents. A member of our staff who was holidaying at Llandudno a fortnight ago, also successfully drove a 1913 model three-speed James with empty sidecar attached, to the tram centre.

### Rowdiness at Competition.

For rowdy behaviour after the speed trials held by the Nottingham and District M.C.C. at Nablethorpe on Aug. 3rd, R. A. Johnson and W. H. Madgwick have been called upon to resign their membership of the Auto Cycle Union. The case of J. King, secretary of the Nottingham and District M.C.C., was very carefully considered, and it was decided to take no action, but to express the sympathy of the A.C.U. with him on this occasion for the treatment he had received at the hands of the police. The case of W. H. Bashall and A. Woodman during the Six Days' Trials week was considered, and it was decided that as no previous complaints had been brought against them, they should be censured by the Chairman and cautioned as to their conduct in the future. It was decided to suspend Vernon Taylor *sine die* for misbehaviour alleged to have occurred at the same time. We understand he has appealed against this decision to the stewards of the Royal Automobile Club.

### A.C. de France Trial.

The Coupe de la Commission Sportive is a six days' reliability event, to be held by the Automobile Club de France from October 7th to the 12th, over a distance of 1,500 kilometres.

### Rudge Cyclecar Experiments.

Every morning, in the early hours, the Rudge cyclecar emerges from the works to undergo its daily test. The first model, which has two standard  $3\frac{1}{2}$  h.p. Rudge engines, has been on the road some weeks. The second is said to have a big single-cylinder engine with a long stroke, but we are given to understand that nothing definite has yet been decided with regard to its final form. The machines have variable pulley gears and belt drive at present.

### Track Trial of the New Triumph.

The experimental overhead valve Triumph, successfully used by J. R. Haswell for the first time in the 150 miles Senior T.T. Race, has great promise. It was not properly tuned up for the event, as it was only decided to use it at the last moment. After Haswell had finished the race, he kindly offered it to us for a trial on the track, and we covered four laps at a speed faster than we have ever travelled on a single-cylinder. There is a noticeable absence of engine vibration, even on the highest speeds. At present the machine will touch 66 m.p.h., but it is considered that this can be improved upon.

### SPECIAL FEATURES.

CYCLECAR DESIGNS (Illustrated).  
TWO NEW SINGLE LEVER CARBURETTORS  
BIRMINGHAM TO CARLISLE AND BACK.

### Paris-Tours Reliability Trial.

The following British entries have been received for the Paris-Tours Trial on the 29th inst.: Vernon Taylor and W. D. South ( $3\frac{1}{2}$  Ridges) and A. J. Dixon ( $3\frac{1}{2}$  Singer). Devay (Triumph), winner of the Grand Prix on the Sarthe Circuit, will also compete. The total entries in four classes are thirty-eight, mostly French machines.

### 1913 Models.

This week we publish the first description and illustrations of the following 1913 models:

- The Averies four-cylinder cyclecar.
- L.E.C. cyclecar.
- Rex cyclecar.
- L'Automobilette.
- B. and B. single lever carburetter.
- Premier three-speed model.
- The Isochronous speedometer.

Illustrations also appear of the latest J.A.P. 90° cyclecar engine, Arden and Alvechurch cyclecars, Amac single lever carburetter, Swan sidecar, and the Smith and Woodhouse racing sidecar.

The first illustrations and details of the 1913 twin-cylinder Hazlewood appeared in our issue of September 19th, but we notice that a contemporary claims the first illustration and particulars this week!

UP ARMS HILL ON A SINGLE CYLINDER SIDECAR.  
Arms Hill, Henley, has been climbed on a  $3\frac{1}{2}$  h.p. two-speed chain-driven Bradbury sidecar. The driver is A. R. Abbott. This is claimed to be the first ascent of Arms Hill on a single-cylinder passenger machine. The total weight of driver and passenger was 21 stone.

## FUTURE EVENTS

- Sept. 28.—B.A.R.C. Meeting.  
 „ 28.—Liverpool A.C.C. Open Reliability Trial.  
 Oct. 5.—Edinburgh M.C.C. Open Hill-climb.  
 „ 5.—Manchester M.C. Open Hill-climb.  
 „ 12.—B.M.C.R.C. Race Meeting.  
 „ 12.—Liverpool A.C. Open Hill-climb.  
 „ 20.—A.C.U. Autumn Open One Day Trial.  
 Nov. 2.—N. Middlesex M.C.C. Open Winter Reliability Trial.

### A C.U. Membership.

Since the last meeting of the A.C.U. Committee well over 500 new members have joined the ranks of the Union.

### Affiliations to the A.C.U.

The Cheltenham M.C.C. and the motor cycle section of the Uxbridge C.C. have lately become affiliated to the governing body.

### The F.I.C.M.

The Canadian Motor Cyclists' Association has expressed its willingness to come to a reciprocity agreement with the Auto Cycle Union, and will probably help to form the new Federation of Motor Cycle Clubs.

### Amateur Police Traps.

The Cyclists' Touring Club, which takes a stand at the Olympia Show each year, and attempts to cater for motor cycle members, is adopting a most extraordinary attitude towards the self-propelled vehicle. According to *The Autocar*, members of the C.T.C. are about to institute amateur police traps with the object of catching scorching motorists. Unattached motor cyclists will do well to think of this action of the C.T.C. when considering which organisation they should join.

### A "Motor Cycle" Prophecy.

After the Tourist Trophy races an article appeared in these columns predicting a big future for the combined belt and chain transmission, and mentioning the possibility of it being largely adopted in 1913. As proof that our words were not far short of the mark, we may instance the fact that of five next year's models we have so far examined four have the combined belt and chain drive, viz., the Premier, New Hudson, Hazlewood, and Levis.

### The Taxation of Motor Cycles.

The evidence of the delegates representing the Auto Cycle Union on the Treasury Horse-power Committee has been absolutely ignored, and this committee appears entirely to have evaded the question of second-hand machines. In recommending the increased taxation of motor cycles, the committee appears to have completely overlooked the light weight of motor cycles. The matter is receiving the earnest attention of the A.C.U., and the Manufacturers' Union, and motor cyclists may rest assured that their interests are being well looked after by both bodies.

### Byelaws which affect Sidecars.

The County Council of Gloucestershire have passed a byelaw compelling all drivers of carts to use either a rear red light or a reflex light. This is an addition to the list we have already published giving the names of counties which have byelaws to this effect. In addition, we have been trying for weeks past to obtain a list of the counties which have a byelaw compelling sidecarists to carry two lights, showing the full width of the vehicle, but up to the present the Local Government Board has been unable to supply such a list. This is rather awkward, as touring motor cyclists do not know which counties have these byelaws and which have not, with the result that two or three motor cyclists have been summoned and convicted for infringing borough and county byelaws. Our advice to all sidecarists is to exhibit two lights, showing the width of the combination.

A LADY MOTOR CYCLIST OF 16.

Miss Phyllis Edwards, of Taunton, must be the youngest lady motor cyclist in the West Country. She is but 16 years of age, yet manages her 2 h.p. Humber with Armstrong three-speed gear with ease. Incidentally, her father, W. P. Edwards, has instructed nine ladies in the management of motor cycles.

### A.C.U. Meeting in Liverpool.

The meeting which has been called in Liverpool, for 2 p.m., on October 25th, the eve of the Autumn One Day Trial, to discuss the question of the amateur, will be confined to clubs affiliated to the A.C.U. It will be held at the St. George's Restaurant, the headquarters of the Mersey Motor Club.

### The Resignation of Mr. Victor Hart.

Members of the A.C.U. will doubtless be interested to learn of the appointment of Mr. Victor Hart to the editorship of *The South African Motorist*, mentioned in our last issue. At a recent committee meeting of the Union, a vote of thanks to him for his past services was accorded.

### A.A. and M.U. Notes.

**A STOLEN MOTOR CYCLE.**—A member has lost, by theft, his  $3\frac{1}{2}$  h.p. Humber motor cycle and sidecar. It is a 1912 model and the frame number is 4251. The machine was stolen from a street in Camden Town.

**SLEEPING AND DRUNKEN CARTERS.**—One of the Association's road patrols recently witnessed an accident caused to a member's motor cycle and sidecar by a market van, the driver of which was asleep when the accident took place. The motor cycle and sidecar were run into a bank and damaged. The van driver was prosecuted, and upon the evidence furnished by the patrol, he was fined £1 and 7s. 6d. costs, or in default 14 days.

The road from Oswestry to Gobowen is closed from September 16th to the middle of November to allow of the reconstruction of a bridge. The alternative route is through Whittington.

THE SUCCESS OF THE MOTOR CYCLIST AS A DESPATCH RIDER.

The motor cyclist has played an important part in this year's Army Manœuvres, and on all sides has received praise for despatch riding. The photograph shows the motor cycle section of the 25th County of London Cyclists attached to the Blue force. They are drawn up for inspection outside their tents.

## THE ISOCHRONOUS SPEEDOMETER.

**A** WONDERFUL clever speed recording instrument has been invented by Mr. B. Bonniksen, 16, Norfolk Street, Coventry, a well-known watchmaker who is known throughout the watchmaking industry as one of its most ingenious members, and particularly as the inventor of the "Karusel" movement, which, by giving a periodic rotation to the carrier of the escapement of a watch, has overcome one of the greatest difficulties in connection with accurate timing, inasmuch as the accuracy of the watch is unaffected by its position.

Now, the principle of Mr. Bonniksen's speedometer, while old so far as watches are concerned, is new in connection with speedometers. Everyone knows that a speedometer must have some form of governor, and this usually takes the form of a centrifugal governor pulling against the resistance of a spring or springs. There is also the electro-magnetic governor, and combinations of both the magnetic and the centrifugal are not unknown.

### The Fundamental Principle.

In the Isochronous speedometer the governor takes the form of an enlarged watch-balance movement, in other words, a wheel moving backwards and forwards under the influence of a balance spring. This is the fundamental difference between it and other speedometers. There is no need for us to enlarge upon the

The new Bonniksen speedometer.

extraordinary accuracy of the watch balance, because that is so well known the world over, nor have we any intention of dealing with the rest of the internal mechanism except to say that it is most carefully and accurately made and tested. It will be noticed, however, that there are two hands on the dial, and both these register alternately. Every five seconds, whatever the speed of the machine, the hand-pointing to the figure is replaced and the other hand flies back to zero. During that five seconds the indicating hand is absolutely immovable upon the speed figure. Then, whether the speed has

gone up or down or remained constant, the hand at zero flies round the dial to the proper place and the other goes back to zero. The speed at which the hands move alternately round the dial depends upon the speed of the motor, but, whether fast or slow, the reading remains absolutely firm for five seconds, and then is immediately continued by the other hand, so that, however fast the road speed, the reading is always easy—indeed, the higher the speed the easier it becomes—and, of course, it is at high speeds that ease of reading is so essential.

### A Speedometer Registering up to 200 m.p.h.

The dial is graduated up to fifty miles an hour and then overlaps, so that at sixty miles an hour it will register ten. Obviously, there is no objection to this, as even the most phlegmatic of riders would not imagine he was doing ten miles when he was really doing sixty. Indeed, the inventor tells us that up to two hundred miles an hour it is impossible to harm the mechanism or to get an inaccurate reading.

It certainly strikes us as being one of the simplest and cleverest instruments we have seen, while the reputation of the maker, who, by the way, invented a speedometer of the centrifugal type for pedal bicycles some twenty years ago, is so high in the watchmaking world that it is almost unnecessary to say that the workmanship is of the highest class.

## New Single Lever Amac Carburetter.

Last week we published a short description of the new Amac single lever carburetter. We are now able to give further details, illustrations, and also our experiences of it after a short road trial. As mentioned last week, a single barrel replaces the two to which we have become accustomed on the 1912 carburetters. This barrel is shaped at the base in the form of an inverted V, a portion of the rear arm being cut away at the bottom so as to allow more air to enter. Either more or less of this arm is cut away to suit various types of engine. As will be seen from the appended sketch, the barrel closes down over the row of jets (six in number), which are supplied by the main controlling jet below.

The throttle barrel.

A drilled plate at the top of the carburetter, forms by opening or closing corresponding air holes in the carburetter cap a slow speed adjustment, but hardly affects the engine when running at high speed. This plate has a milled edge, and is held in position by a spring washer. The adjustments necessary from atmospheric or other conditions, can be carried out in

a few seconds and without the use of tools.

We gave the device a short trial on a 6 h.p. single-gear Matchless sidecar combination and found it to work admirably. We could throttle down and run steadily at about 10 m.p.h. and pick up

Complete Amac carburetter.

quickly to a good speed. Running free the engine throttled down quite slowly, and if the valve stems had not been slack in the guides, through wear, thus causing a considerable air leak, it would probably have run even slower. The advantage of a single lever carburetter eliminating the

personal factor in driving will be apparent to all.

While on this subject, the Amac Co. particularly wish us to again impress on our readers the necessity of preventing air leaks on the engine side of the throttle, as these are the cause of many complaints that engines will not run slowly.

Method of adjusting air supply.

The firm will, of course, continue to manufacture their two lever types, which will embody several small improvements. Notably the control is neater, and is fitted with milled finger adjustments for the wires. The five jets on the present type will in future be replaced by six

# CLUB NEWS

## Lincolnshire A.C. (Motor Cycle Section).

A social meeting of members of this section will be held at Skegness on September 29th. The rendezvous is the Lion Hotel at 11.30 a.m.

## Westmorland M.C.C.

The balloon race will take place on Thursday, Oct. 3rd; the balloon being liberated at 4.30 p.m., at the top of Hutton Park Hill.

## Llanely and District M.C.C.

A non stop reliability run was held on the 14th inst. over a course of fifty miles. The following is a list of the awards: 1. Luther Griffiths (3½ Premier), gold medal; 2. E. Morgan (3½ Trump-Jap), silver medal. This is the first year of this club, and already over fifty members have been enrolled. In the hill-climb, held on September 3rd, L. Griffiths (3½ Premier) gained first prize, E. M. Williams (3½ Triumph) being third.

## Western District M.C. (London).

The petrol consumption trial took place on the 21st inst. over a sixteen and a half miles circular course, starting from Gerrard's Cross. The results, subject to confirmation, are:

	Fig of merit.	m.p.g.
1. F. W. Ritchie (8 Matchless)	... 391	... 107
2. M. J. Tweedie (3½ N.S.U.)	... 382	... 85
3. E. S. Ritter (2½ Douglas)	... 370	... 160

A committee meeting will be held at headquarters to-morrow (Friday) evening at 8 o'clock.

## Exeter and District M.C.C.

The above club will hold an open hill-climb on Merry Pitt Hill, near Postbridge, on the 6th prox. The climb will be on the knock-out principle, and there will be three classes, viz., 350, 560, and 1,000 c.c. A special cup has been presented by Mr. W. W. Douglas for lightweights, and gold medals will be awarded to the winners in other classes. The hill is five-eighths of a mile long, and is perfectly straight from start to finish. Entry forms, etc., are obtainable from the hon. secretary, Mr. E. H. Chestnut, Exeter Garage Co., Paris Street, Exeter.

## Sutton Coldfield and Mid-Warwickshire A.C.

This club will hold a petrol consumption test for motor cycles, sidecars, cyclecars, and motor cars, on Saturday next, starting at 2.30. The following formula will be used:  $\frac{c.c. \times weight}{Petrol used}$ , highest figure to be the winner.

## Luton and South Beds M.C.C.

A hill climb was held at Sundon on the 18th inst. The formula was that used recently by the Ayr and District M.C.C., which gave very good results. Gutteridge (3½ Rudge) made fastest time. Results: 1, Gutteridge (3½ Rudge); 2, Brighton (8 h.p. Chater-Lea); 3, Smart (3½ Rudge); 4, Jarvis (3½ Triumph); 5, Dickinson (3½ Rudge); 6, Terry (3½ New Hudson).

## Manchester Hundred M.C.

The club held a hill-climb at Axe Edge, Buxton, on the 15th inst. Results, on the Nightingale formula, are as follows: 1. H. Thompson (3½ Kynoch); 2. S. P. Dawson (4 F.N.); 3. H. C. Hambleton (3½ Bradbury). Harold Breakell (5 twin Indian) made fastest time of the day. A speed-judgment competition, from Manchester to Bakewell, will be held on Saturday next.

## Glasgow M.C.C.

This club held recently a 100 miles non-stop run which attracted twenty-one entries. The weather broke down at the start, however, and of the eighteen starters only five qualified for gold medals. Belt slip, shortage of petrol, and sideslip accounted for many failures, even on the first round of the twenty-six mile circuit, which included some severe hills. A Clyno was the only passenger machine to obtain a medal. One rider ran out of petrol a few miles from the finish, and another finished six minutes before his schedule time after a non-stop run, both losing awards thereby, while a third rider mistook the finishing point, and was awarded a silver medal, as no departure from the rules could be made. The gold medal winners were: Thomson (James), Orr (Ariel), Chisholm (Ariel), Lanson (Clyno and sc.), and the rider of a Rudge.

The first motor cycle race in Calcutta proved a great success. Our photograph shows the start on the Barrack-pore Trunk Road. There were 30 competitors, handicapped according to size of engine used. The results were 1st, Johnstone (2½ Enfield); 2nd, Gale (3½ Ariel); 3rd, Robertson (2½ Enfield). First prize was a purse of 100 rupees (about £10) presented by the Maharaja Tagore.

Starting the first competitor in the Mersey M.C. non-stop run to Llandudno, last week-end. The sidecar is a Clyno. The start was on the new Chester and Queensferry Road, near Eastham.

#### Goulburn (N.S.W.) M.C.

The last hill-climb of the above club was held on an alleged gradient of 1 in 3 for seven-tenths of a mile. The winner was timed to do 1m. 12s., and he rode a twin King-Dick, as did the second and third competitors.

#### The Motor Cycling Club.

A paperchase has been arranged for September 28th, starting from the Abercorn Arms, Stanmore, meet at 2.30 p.m. There will be two classes: 1, solo machines; 2, passenger machines. The trail will be laid through Hertfordshire lanes, and so distributed that a high-powered machine will have no advantage over a lightweight.

#### North-west London M.C.C.

The race meeting and gymkhana at the Stadium, Shepherd's Bush, on Saturday next, promises to be an interesting and well attended function. The open races will take place between 3 and 4 p.m., and the charge for admission has been fixed at the lowest possible figure, viz., 1s. There are sixteen events, and racing will start at 2 p.m. The entrance fee is 7s. 6d. for one event and 10s. for two. The A.C.U. has granted a permit for the open motor cycle races, provided engines are used with a total displacement which does not exceed 300 c.c. Machines must have long exhaust pipe, silencer, and brake, otherwise there are no restrictions. Entry forms can be obtained from the Editor of *The Motor Cycle*, or Mr. H. J. Pooley, 23, Clifton Avenue, Finchley, London, N.

#### Scarborough and District M.C.

The resignation of the secretary, Mr. J. W. F. Tranmer, has been accepted with regret, and Mr. H. Frain, who acted as hon. secretary during 1910-11, was unanimously re-elected to the post. The club has written to the A.A. respecting certain dangerous corners near Scarborough.

#### Herts County M.C.

This club has been compelled to abandon the idea of holding an open hill-climb this year, the Manufacturers' Union having definitely refused their support to such an event. The next important fixture will be the third open quarterly trial on Saturday, October 5th.

#### Willesden Green C. and M.C.C.

The result of a speed-judging and reliability trial held last week-end for a cup presented by the New Hudson Cycle Co. was as follows: 1, W. J. Williams (3½ B.S.A.); 2, E. Bolner (2½ Douglas); 3, W. H. Wilson (8 Bat Jap). The president's prize goes to J. T. Carpenter (Invicta cycle-car), for a total of five non-stops during the season's events.

#### North Middlesex M.C.C.

In a special notice to the members signed by the hon. secretary, Mr. H. Boocock, and the chairman, Mr. W. H. Browne, the committee point out that for next year they propose to cater for the amateur, and will endeavour to cater for the amateur, and will endeavour to arrange joint arrange joint or inter-team competitions with other clubs. The late hon. secretary, Mr. G. D. Blakey, has resigned, as also has Mr. J. A. Hilger, the Trials secretary.

#### Liverpool A.C.C.

The following is a list of classes for the open hill-climb to be held on October 12th on a hill about thirty miles from Liverpool:

1. Single-cylinders up to 350 c.c. (on formula).
2. Twin-cylinders up to 350 c.c. (formula).
3. Single-cylinders, 351 c.c. and over (formula).
4. Twin-cylinders, 351 to 500 c.c. (formula).
5. Twin-cylinders, 501 and over (formula).
6. For Junior T.T. machines (time only).
7. For Senior T.T. machines (time only).
8. Any machine (time only).
9. Stopping and re-starting, any machine (on time).
10. Stopping and re-starting, any machine (on formula).
11. Any single-cylinder sidecar (on formula).
12. Any twin-cylinder sidecar (on formula).

Variable geared machines allowed in any class.

The entry fees (which must be sent in by October 7th) are 10s. each class for trade riders, and 5s. for amateurs (club members half price). Late entries at double fees, will be received up to midday on the day of the climb. The formula

$$C \times T^2$$

to be used is  $\frac{C \times T^2}{W}$  as recommended by *The Motor Cycle*.

W

#### Dublin and District M.C.C.

The racing season at Portmarnock was brought to a conclusion on Saturday afternoon with the fifth series of speed trials held under the auspices of the Dublin and District Motor Cycle Club. There were three events, the principal one being a twenty miles open handicap. Results:

Two Miles Novices' Handicap.—1, W. F. Parson (2½ h.p. Singer), 20 secs. start; 2, V. J. Jarvice (3½ h.p. Triumph), 40 secs. start; 3, J. Boyton (3½ h.p. Triumph), 10 secs. start. Winner's time, 2 mins. 50 secs.

Eight Miles Scratch Relay Race.—1, F. J. Walker (3½ h.p. Rudge) and W. Curtis (5 h.p. Indian), 10 mins. 11½ secs; 2, W. J. Towser (3½ h.p. Rudge) and J. Heog (3½ h.p. Rudge), 11 mins. 3 secs.; 3, T. E. Greene (3½ h.p. Rudge) and J. Boyton (3½ h.p. Triumph).

Twenty Miles Open Handicap.—W. Curtis (5 h.p. Indian), 24 mins. 36½ secs.; 2, J. Boyton (3½ h.p. Triumph), 26 mins. 30 secs.; 3, F. J. Walker (3½ h.p. Rudge), 26 mins. 23 secs.

A group of members of the Sheffield and Hallamshire M.C.C. taken before the start from Owl Bar for the competition last Saturday.

**Club News.—**

**Portsmouth M.C.C.**

An enjoyable run to Warnford, in the Meon Valley, was made on the 15th inst. Thirty took part.

**Purley and District M.C.C.**

The result of the last night trial of the Purley and District M.C.C. was a tie between C. W. Meredith (Bradbury sc.) and W. F. Symonds (Triumph), who share Mr. Murray Scott's challenge cup for next year. Third place is taken by D. H. Ebbutt (A.C. Sociable), and fourth by V. Tomkins (Rover).

**South Birmingham M.C.C.**

The above club held a paperchase on the 14th inst. over a rough course in the vicinity of Alcester. There were about fourteen starters. The result was a good win for A. H. Johnson (3½ Alldays), J. J. Woodgate (2½ Singer), who had innumerable belt troubles, being second, whilst J. Huntington (T.T. Triumph) filled third place.

**Herts County A.C.**

In the paperchase and "konking" expedition on the 14th inst. the competitors had, without doubt, the most severe thirty miles' gruelling of their lives. Two fiends laden with paper and mounted on a 3½ h.p. Zenith and 3½ h.p. Triumph respectively left Redbourne punctually at 3 p.m., and ten minutes later some twenty-three motor cyclists started in pursuit. The route had been carefully mapped out beforehand, and trouble was early in store for the poor hounds, sixteen of whom petered out in the first five miles. Only three survivors completed the course, their times behind the hares being as follows: Gutteridge (Rudge), 22m.; Biggs (Bradbury), 38m.; Nott, 50m. The "konking" was wonderful to hear.

**Taunton and District M.C.C.**

The results of a hill-climb held on the 12th inst. on Buckland Hill near Taunton, were as follow:

**CLASS I.—LIGHTWEIGHTS.**

T. H. Birdsell (2½ Enfield) ...	fastest time
T. Marks (2½ Motosacoche) ...	3½s. slow
A. H. Knight (2½ Humber) ...	4s. slow

**CLASS II.—HEAVYWEIGHTS.**

E. J. Hancock (3½ T.T. Premier) ...	fastest time
H. F. Potter (3½ Premier) ...	16s. slow
W. H. Lock (3½ Rex) ...	17½s. slow

**CLASS III.—FLEXIBILITY.**

T. G. Crump (3½ P. and M.) ...	difference 6m. 9s.
W. G. Potter (3½ P. and M.) ...	difference 5m. 2s.
T. Marks (2½ Motosacoche) ...	difference 4m. 6s.

**CLASS IV.—SIDECARS.**

W. E. Phillips (3½ Triumph) ...	fastest time
W. G. Potter (3½ P. and M.) ...	25s. slow

**North Birmingham A.C.**

This club is holding a six hours' reliability run on the 29th inst., leaving headquarters, the Acorn Hotel, Erdington, at 10 a.m. First prize, gold medal; second prize, silver medal. Entrance fee, 2s. 6d., which must be paid a week in advance.

**Sheffield and Hallamshire M.C.C.**

The awards in the recent reliability trial held by the above club have now been passed by the committee and are as follows: First prize, S. Sawyer (3½ Premier) and — Stacey (3½ Rudge) tie; silver medals, — Dudley (3½ Precision), Eardley (—), J. Carter (A.J.S. sc.), and G. Carter (A.J.S.).

**Manchester Hundred M.C.**

A hill-climbing competition for motor cars and motor cycles, in two classes, was held at Axe Edge, Buxton, on the 15th. The course was 1 mile 528 yards. H. Breakall (7 twin Indian) made fastest time of the day, and H. Thompson second fastest. The results are to be decided on formula.

**Furness M.C.C.**

A reliability trial was held on the 15th inst., the course being a circular one of 128½ miles. There were fourteen competitors, and the speeds between the different controls varied from 16 to 18 m.p.h. There was also a secret check. The trial was very keenly contested, the ninth man losing only two minutes. Result:

1. P. L. Bryant (Triumph) and E. E. Clow (6 h.p. Zenith) tie for first place, 100 marks, both one mark out at secret check; 3. H. Biamire, 100 marks, three marks out at check.

**Derbyshire and North Stafford A.C. (Motor Cycle Section).**

The last speed trials of the season took place on the 14th inst., under most favourable weather conditions. The course selected was from Etwall to the Burton Road, the distance of the races being one kilometre, from a standing start. Excellent sport was witnessed, some of the finishes being extremely close. The competitors were again handicapped on the trial run times, any competitor reducing his trial time by more than five per cent. being disqualified. Results:

Round I.—D. C. Bolton (3½ Rudge), scratch, beat A. F. W. Geeves (1 Bolton-Jap); G. G. Walkden (Bradbury), 12½s. start, beat H. Russell (Bradbury), scratch (Walkden exceeded his allowance and was disqualified); E. T. Bolton (3½ Scott), 10½s. start, beat F. Newton (Triumph); E. Russell (1 Russell), 15½s. start, beat F. Smith (2½ Douglas).

Round II.—D. C. Bolton, scratch, beat H. Russell, 7½s. start; E. T. Bolton, scratch, beat E. Russell, 15s. start.

Final.—E. T. Bolton, 14½s. start, beat D. C. Bolton, scratch. E. T. Bolton, however, exceeded his allowance, so the second place was decided upon by a knockout between H. Russell, E. T. Bolton, and E. Russell, E. Russell (1 Russell) winning. D. C. Bolton takes a silver medal for fastest time of the day, also silver medal for first place. E. Russell takes a bronze medal for second place.

**LEICESTER M.C.C.'S INTER-CLUB HILL CLIMB AT AB KETTLEBY.**

1) W. P. A. Chapman (6 h.p. Champion-Jap) starting in the sidecar class. This rider was first in the multi-cylinder and sidecar classes.

(2) F. Snowden (3½ n.p. Rudge), who was first on formula in the sidecar class, rounding the first bend on the hill.

## QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Cambridge to Keswick and Cambridge to Portsmouth.

? Would you kindly tell me the best route (to avoid hills as much as possible) and mileages from (1) Cambridge to Keswick, (2) Cambridge to Portsmouth? I wish to avoid big hills, as my machine is a  $3\frac{1}{2}$  h.p. single-gear one—a Triumph.—E.M.N.

Your best routes would be as follows: (1.) Cambridge, Godmanchester, Huntingdon, straight up the Great North Road through Stilton, Stamford, Grantham, Newark, Retford, Doncaster, Ferrybridge, Aberford, two miles south of Wetherby, turn left and go through Otley, Ilkley, Skipton, Settle, Ingleton, Kirkby Lonsdale, Kendal, Ambleside, to Keswick. You will find the Kendal Road somewhat hilly, but this cannot be avoided. There is nothing on this route which a  $3\frac{1}{2}$  h.p. Triumph will not take with ease. The distance is approximately 250 miles. (2.) Cambridge, Royston, Baldock, Stevenage, Welwyn, Hatfield, St. Albans, Watford, Rickmansworth, Denham, Uxbridge, Colnbrook, Staines, Chertsey, Guildford, Godalming (where drive with extreme caution), Milford (keep to right), Hindhead, Petersfield, Cosham, to Portsmouth. The distance is approximately 110 miles. Godalming can be avoided by turning to the left at Peasemarch, about half-way between Guildford and Godalming (or by going through Shalford). The road, which

is rather narrow but fair, passes over Munstead Heath and skirts Busbridge Hall; a mile further on turn sharp to the right at Hydestile, and passing Milford Street take the Portsmouth Road at Milford, crossing the Haslemere Road at the entrance to the village.

### Magneto Queries.

? Some time ago you were kind enough to help me with the timing of my twin Rex. One more question I would like to ask you, and that is with regard to the magneto, which runs in the reverse way to the engine, which is a 5 h.p. twin. The two metal segments on the contact breaker ring are evidently of a different size, for in one case the platinum points break directly the fibre cam comes in contact with the segment, and in the other case the fibre cam has travelled nearly half way over the segment before the points break, and they do so very gradually instead of opening completely all at once as in the other case. Moreover, the segments are marked I. and II., which refers to the cylinders, but which cylinder is I. and which II.? When does the spark occur at the plug?—J.R.W.

The break should occur for each cylinder when the fibre block comes in contact with the segment. Evidently one segment wants packing up a little from the

back; or try a new contact maker. The platinum points should separate quickly. The back cylinder is usually No. 1., but you can easily verify this by noting, with the help of a piece of wire passed through the compression tap, which cylinder is at the top of its firing stroke, or nearly so, at the moment when the points break on No. 1. segment. The spark occurs at the moment when the platinum points separate.

### Engine Overheating.

? I should be very pleased if you could enlighten me on one or two points, *i.e.*: (1.) Engine getting nearly red-hot after the first four or five miles, therefore losing most of its power. (2.) Failure to answer to throttle after having same about half open. (3.) How can I stop oil working out of the joint of the crank case? My mount is a Minerva machine with Bosch magneto and B. and B. carburettor. The power of the engine is very good when cold. I have had it to pieces as the magneto gear got broken.—E.H. (Northfield).

(1.) The cause of the first trouble might be want of lubrication or maladjustment of the carburettor. (2.) This also would prevent the machine from answering to the throttle. Possibly too large a jet is fitted. (3.) A packing of brown paper soaked in boiled linseed oil. Also check over your timing carefully. You may have upset this in re-assembling.

Some of the motor cyclist despatch riders who were acting in conjunction with the Blue and Red armies in Cambridgeshire last week.

**MEMBERS OF THE CAPE PENINSULA M.C.C.**

Competitors meeting outside the cycle track, Mouille Point Road, August 24th. The occasion was the slow speed competition.

**Dissolved Acetylene.**

?

I am a medical man about to give up my horses and traps, and have gone in for a motor cycle—a Scott. I shall be greatly obliged for your guidance about the following liquid acetylene outfit: Where it can be obtained, where recharged, if satisfactory, and the cost. —J.H.K.

Liquid acetylene for a motor cycle is somewhat unwieldy on account of the size of the cylinder. The Dissolved Acetylene Depot is at Long Acre, E.C., whence full particulars can be obtained. They have depots throughout the country where these cylinders may be recharged or exchanged. It is quite satisfactory, but somewhat expensive (see page 528 of our issue for May 16th, 1912).

**Repairer Sells Magneto Parts.**

?

Recently I broke the frame of my motor bicycle, and took it to a local garage to be repaired. Whilst waiting for the frame to come back from the makers the proprietor of the garage sold the contact spring and cover off my magneto (unknown to me). When I went for the machine he duplicated the sold parts, but the motor would not go with the spark advanced. It broke down altogether since, and has cost me various sums. Now it refuses to spark at all. I have taken it back to him, and pointed out that as it was quite in order when he had it in the first place, he must put it quite in order again. This he refuses to do, and will not promise to reimburse me for out of pocket expenses and the necessary repairs to the machine. What do you advise?—F.S.S.

Our legal adviser writes as follows: "If all parties agree that the repairer had nothing to do except to repair the broken frame, he would have no right to interfere with the contact spring or the cover to the magneto, and certainly he had no right to sell same. On the face of it, it seems to me to be a criminal offence; but, in any event, your correspondent can sue the repairer for the damage reasonably sustained through the wrongful action. I think your correspondent's best plan is to get the machine back again from the repairer and let someone else examine it,

and then consult a solicitor, who would be able to advise as to the best course to adopt, having regard to the whole circumstances and the evidence."

E. Clissett (5½ h.p. B.S.A.), who was the most successful competitor at the Cowbridge and District M.C.C. hill-climb.

**Silent Motor Cycles.**

?

(1.) I should be very glad if you could tell me which makes of motor bicycle are the most silent. I have been told that the engine is very silent indeed on an Indian.  
(2.) I should also be glad if you would tell me if the lightweight motor bicycles, with free engine and two speeds, are easy to start.—T.T.

(1.) You will certainly find the Indian to be a very silent machine. Several other motor bicycles also run very quietly; in fact, most machines are silent with the

cut-out closed, but, unfortunately, too many owners run with the cut-out open. Almost any machine can be made quiet with the addition of a good silencer. (2) Most lightweights are very easy to start, particularly if possessed of a variable gear.

**Sluggish Starting with a Twin-cylinder Machine.**

?

My 5 h.p. twin will sometimes only fire on one cylinder for fifty or sixty yards when starting; then the other one starts, and no more trouble is experienced throughout that journey. It is always the rear cylinder that fails. At night-time when it starts like this, I see sparks running from the bearing of the magneto along the sleeve of the chain sprocket, and every time these sparks disappear the engine fires perfectly at all speeds from a walking pace. I have cleaned and adjusted the contact-breaker, examined both brushes (both seem perfect), tried new plugs, and yet it occasionally does this after the machine has been left for a time. Can it be oil or dirt inside the magneto? The magneto is a D.A.V., 1910.—A.M.G.

Probably the trouble is due to a poor connection in the magneto, the carbon brush sticking, oil on the sparking plug, or the plug on this cylinder having a greater gap than the other. Sticking of the carbon brush might cause the external sparking of which you complain. You might try cleaning the collector ring of the magneto.

**READERS' REPLIES.**

**Oily Plug in Rear Cylinder.**

In reply to enquiry of "W.E.I." in *The Motor Cycle* of September 5th re the back plug of his 6 h.p. twin sputting up, if he would use one of the Auto plug cleaners, obtainable from any of the large accessory houses, he would find his trouble immediately disappear; I find the device most effective on my own machine.—E. WIXSON.

**EXPERIENCES WANTED.**

"E.H.M." (Finchley).—4 h.p. Scott and Canelet sidecar.  
"E.G.T." (Smethwick).—3½ and 4½ h.p. Precision engines.  
"C.H.M." (Bradford).—6 h.p. T.T. Matchless, Bat, and Zenith.  
"W.E.A." (Coventry).—Free engine and change-speed gear to suit 1908 Triumph and sidecar.  
"S.V." (Bishop's Stortford).—2½ h.p. New Hudson. Durability, and working of three-speed hub.

If "T.S." (Stockport) and "W.T." (St. Helens) will comply with our rules and send stamped addressed envelopes they will receive replies to their queries.

**"The Motor Cycle" Photographs.**

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates:—Unmounted prints, half plate, 1/6 post free; mounted, 1/9 post free. This refers only to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

### The Future of the F.N.

The F.N. Motor Agency, 106, Great Portland Street, and 45, Clipstone Street, W., is shortly to be taken over by "F.N." (England), Ltd., temporary premises 31, Foley Street, W.

### Cyclecar Silencers.

J. C. Lyell and Co., 113, Great Portland Street, W., inform us that they have lately produced a new silencer for the 8 h.p. twin engines largely used on cyclecars.

### Three Successive Wins.

The Greig challenge cup was won outright at the Streatham and District hill-climb by F. W. Barnes on a Zenith. Barnes has won this cup three years in succession, and it is now his property.

### New Electric Lamp.

Messrs. Alfred Dunhill, Ltd., 359-361, Euston Road, N.W., who have long been dealers in motor cycle accessories; have now so far specialised in this branch of their business that they have set aside a totally separate department, in which none but motor cycle goods are sold. In it are to be found specimens of clothing and all types of accessories, including

Dunhill's electric motor cycle lamp.

a neat looking electric sidecar lamp, which we illustrate herewith. A speciality is the Dunhill sidecar, which is strongly made, well finished, and provided with telescopic joints. Below the accessories department is a repair shop, where motor cycle repairs are effected.

### A Comprehensive Win.

In the hill-climb held by the Portsmouth section of the Hants M.C.U., Premier machines greatly distinguished themselves, particularly in the sidecar class, in which they gained second, third, fourth, fifth, and seventh places. This is a big scoop for one make of machine, especially as the well-known  $3\frac{1}{2}$  h.p. type was responsible for each position.

### Humber Success in the Colonies.

A one mile speed contest, organised by the Diamond Fields M.C.C., Kimberley, South Africa, last month, attracted eleven entries, all, with the exception of B. Carnell, being mounted on  $3\frac{1}{2}$  h.p. machines. Mr. Carnell rode his  $2\frac{1}{2}$  h.p. Humber twin lightweight, and demonstrated in a convincing manner the speed capabilities of this model, for, notwithstanding that it was the lowest-powered motor cycle in the contest, it made fastest time of all competitors, and secured the silver trophy.

### Electric Lamps.

Siemens Bros., Ltd., Tyssen Street, Dalston, N.E., have now got a full range of Wotan battery lamps, which can either be run from dry batteries or accumulators. These lamps have filaments of pure drawn Tungsten wire, and are operated at an exceedingly high efficiency.

### A Gloucester Garage.

A new garage has been opened in Gloucester, known as the Bristol Road Motor Garage Co. The general manager, W. J. Welling, was formerly a works superintendent at Kynoch's, Birmingham.

### Belt Fastener Case.

We have been using a Forward belt fastener case this season. It is a handy little leather case in which reposes any type of fastener, and as it protects the fastener screws and nuts they do not get abraded by vibration.

### Useful for Cuts.

The Hutchinson Tyre Co., 70, Basinghall Street, E.C., have sent us a sample tin of Vanoric bandage. This is both antiseptic and adhesive, and all that is necessary in the case of cuts and wounds is to wrap it round the injured member and lap it over on to itself. We trust we shall not be called upon to use it.

### Books to Read.

The latest edition of the Homeland Reference Books—"Southern England, Coast and Countryside," The Homeland Association, Ltd., 15, Bedford Street, Strand, W.C. This booklet contains an article on the cathedrals of Southern England by E. W. Harvey Piper, a special article on the South country by Arthur Henry Anderson, and other useful information concerning motoring, golfing, and angling.

S. W. Phillpott (2nd Humber), who finished fifth in the Junior T.T. Race on Brooklands, but was not properly checked owing to the Senior Race having to be started before all the Junior T.T. competitors had finished.

### Universally Jointed Connecting Rods.

The Lloyd Motor Engineering Co., Ltd., Birmingham, inform us that they are still making pistons for L.M.C. machines with a universal joint to the small end of the connecting rod. These are being fitted to certain speed machines.

### Catalogues Received.

The latest catalogue of the Crescent cyclecar, which is made by Crescent

Auto Aero Co.'s wind scoops which deflect cool air to the valve pockets.

These vehicles are now friction driven. The bodies are particularly smart looking, the sociable type having a flush-sided body of very neat design, to which a Cape cart hood and screen can be fitted. We notice a tandem model with flush sided body is still listed.

### Binks Racing Carburetter.

S. R. Axford, who performed so well at the Streatham hill-climb, used one of the new Binks racing carburetters, illustrated and described in this journal on April 4th, 1912, page 364. He won three firsts and made fastest time of the single-cylinder machines, and also scored the highest figure of merit.

### Valve Covers.

Motor cyclists are aware that no matter how carefully made the engine may be a certain amount of oil usually exudes from the tappet guides. One or two makers have fitted valve covers, which certainly make a motor cycle engine look neater, as even if a little oil does exude, dust and grit are not attracted to the sticky surface of the valve cover guides, springs, etc., because they are protected by the cover. These covers have been up to now a feature of one or two makes only. Mr. Tom Ford, 98, Chestergate, Macclesfield, has, however, introduced a valve cover which will fit existing machines of all the leading makes. The annexed sketch is self-explanatory.

The spring blades which fit around the cylinder.

The valve cover in position on a New Hudson.

The spring blades fit each side of the cylinder so holding the cover firmly in position. The body of the cover is of aluminium, polished, and shaped at the lower end to a neat fit on the tappet guide projections on the crank case, while the gripping springs are nickel-plated. Inset is a small illustration of a New Hudson motor cycle engine fitted with one of the covers in question, and very neat it looks.

## In splendid isolation—

By reason of its SPRING FRAME—(fore and aft)—WEATHER-PROOF MAGNETO POSITION—TWO-SPEED GEAR (countershaft type)—FOOT-STARTER (free of the footboards and SILENT, SUPPLE CHAIN DRIVE.

No other motor cycle has all these features.

## WHY Is it that on nearly every one of the "crack" machines you see about everywhere you find a **LODGE PLUG?**

One reason is probably that the owner is a discerning rider and knows a good sparking plug when he sees one.

Again, it is now widely known amongst motor cyclists that a Lodge Plug is so designed as to develop just a shade more power than can be obtained with any other plug made. And engine power is what they want.

Suitable with all magnetos on all motor cycles, the Lodge Plugs are English made, and are obtainable everywhere.

**Price 4/- each.**

When ordering specify "motor cycle type"—those in RED boxes.

## IMPORTANT PUBLISHERS' ANNOUNCEMENT

During the two years "THE AUTOMOBILE ENGINEER" has been in existence, it has proved remarkably successful. We feel, however (and the impression is confirmed by the opinions expressed by many readers), that its scope and usefulness are curtailed by the restrictions which are necessarily imposed through publication only once a month.

The prime interest of "THE AUTOMOBILE ENGINEER" has all along been centred upon internal combustion engineering, but it has been found impossible, in a monthly paper, to treat the subject as broadly as was intended originally, and as is desirable in view of the enormous increase in the applications of the internal combustion engine.

It has therefore been decided to broaden the scope of the paper considerably by dealing also with other and larger internal combustion engines, their construction and application; in fact, to make the paper the authority on the subject of modern prime movers.

To render this enlargement of scope possible the paper will be published fortnightly, on and after October 2nd next, and the title will be altered to

## INTERNAL COMBUSTION ENGINEERING

incorporating "THE AUTOMOBILE ENGINEER."

The size, style and price of the paper will remain as at present, and the features which have established "THE AUTOMOBILE ENGINEER" will be retained, but the greater frequency of publication will permit exhaustive treatment of a far wider range of subjects than hitherto has been possible. Fuller details will be published later.

## 2 Firsts, 8 Seconds, 4 Thirds, and fastest time of the day on STERNOL

These successes were scored by Tessier  
and Newman, in the Open Hill Climb  
at Titsey, on 7th Sept., lubricating  
with standard quality "Sternol."

Silver Cup & Two Gold Medals.

The Silver Cup for best performance  
by a private owner on observed hills in  
'the 6 Days' Trial was awarded to  
D. W. Cooke, who also secured a gold  
medal, and qualified for a special gold  
medal for his performance on Portlock.

At Brooklands Junior T.T. Race of  
150 miles, Second place was taken by Hugh Mason on a Twin N.U.T.,  
J.A.P. Standard quality "Sternol" was used in both cases.

Write for particulars and prices of "Sternol."

**STERNOL**

56, Royal London House,  
Finsbury Sq., London, E.C.

One of the Classic Events  
of the 1912 Race Season.

# BROOKLANDS T.T. RACES

14/9/12.

## THE SENIOR RACE

was won by J. L. E. Emerson  
on a 3½ h.p. long stroke Norton  
on which he was using our  
filtered, racing grade Castor oil.

J. R. Haswell was second on a  
3½ h.p. Triumph, and he was  
using Motorine A.

## THE JUNIOR RACE

like the Isle of Man Event was  
a splendid success for the  
Doug'as. It was won by S. L.  
Bailey, who was using Summer  
Huile de Luxe.

Hugh Mason on a N.U.T. was  
second. He was using our  
Motorine A.

## PRICE'S OILS 1st & 2nd in both Races.

1912 Lists of all Oils will interest Motor Cyclists.

# PRICE'S PATENT CANDLE CO. LTD., BATTERSEA, LONDON, S.W.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

### SECTION II.

York and Lancashire.

### SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

### SECTION IV.

## ASK FOR A COPY OF THE LIST.

Call and see our great show of over 300 Motor Cycle Bargains, largest & most easily accessible from every part.

Phone—5777 Holborn.  
Wires—Opifcer, London.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters must be addressed to numbers at "The Motor Cycle." When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be forwarded replies. Only the number will appear on the advertisement. Replies should be addressed, 000, c/o "The Motor Cycle," Coventry"; or if "Lor" is added to the address, then to the number given "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown parties may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of goods is three days, and if a sale is effected we remit amount to the seller, but if not we return the amount to the depositor, and each party to the transaction carries one way. For all transactions exceeding £ value, a deposit fee of 2s. 6d. is charged, when the fee is 1s. All deposit matters are dealt with in Coventry, and cheques and money orders should be payable to Illife & Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive answer to their enquiries are requested to regard silence as an indication that the goods advertised already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to one by post.

LEADERETTE:

## Motor Cycle Taxation.

**F**OLLOWING the article published in our last issue, we return to the question of taxation, which is now occupying the minds of motor cyclists all over the country. What motor cyclists must do if they wish the recommendation of the Taxation Committee to be reconsidered by the Government is to act, and act quickly; otherwise what is now a recommendation will become a law.

We think the real question motor cyclists should ask themselves is, What are we being taxed for? If it is for the use of the roads—and we presume it is—our opinion is that taxation should be based on a combination of bore and weight. The desire of the Committee is to bring the taxation of motor cycles into line with motor cars; therefore the light weight of a motor cycle should be taken into consideration. For example, if the recommendation become law, a twin-cylinder sidecar combination with an engine over 72 mm. bore, and weighing about 4 cwts., will be taxed £3 3s. per annum, the same amount as a four-cylinder 11 h.p. motor car weighing about a ton and carrying four passengers. This example alone is sufficient to show the absolute absurdity of the recommendation and its unfairness.

We cannot help thinking that those who are responsible for the recommendation cannot have sufficiently considered the light weight of motor cycles and the very little damage they do to roads in comparison with heavier forms of vehicle. This being the case, and taking into consideration the protests we have received from readers on the subject, we have inserted in this issue a loose inset with the wording of a petition to the Government.

Readers are asked to assist to prevent increased taxation of motor cycles, particularly small twin-cylinders over 63 mm. bore and sidecar machines with engines over 72 mm. bore. With the form of the petition we publish an article embodying our suggestions, and the reasons why we think the present recommendation unfair to motor cyclists in general. We suggest to our readers that they should sign this petition form themselves and obtain as many additional signatures as they possibly can. Space is allowed for twelve signatures, but if further signatures are obtainable they can be written on a plain sheet of paper and attached to the form.

The petitions should be addressed, The Editor, *The Motor Cycle*, 20, Tudor Street, E.C., and envelopes should be stamped with a penny stamp.

In addition to signing the petition, readers will greatly assist the movement if they forward the copy of the article on the subject (which will be found on the back of the petition form) to the member of Parliament representing their borough or county, accompanied by a letter stating the horse-power of the machine owned, with bore and stroke and weight, and asking the member in question to vote against any

increased taxation on motor cycles; also to ask for the matter to be referred back to the Taxation Committee for further consideration.

## Some Reflections on the Cyclecar Movement.

**W**E recently had a long talk with a prominent designer and manufacturer of one of the earliest successful passenger vehicles, who is now engaged in the production of a high-grade motor car. People are apt to look upon the cyclecar movement as something absolutely new, whereas it is really not so. The early-day Phoenix quadcar, the 6 h.p. Rover, the 9 h.p. Riley, the O.T.A.V., and other light four-wheelers were forerunners of the modern cyclecar, and designers knew, in those early days, that to sell their vehicles it was necessary to place them on the market at as low a price as possible. The consequence was that the cost of constructing the "quad," which was in its declining days when the tricar rose Phoenix-like from the ashes of the latter, placed the four-wheeler out of the question altogether in comparison with a tricar, perhaps owing to the expense of the differential and extra wheel. Now belt drive did not prove satisfactory with the heavier types of three-wheeler, and quickly chain drive came along and survived until this class of vehicle became practically obsolete from a manufacturing point of view. The reasons why the tricar went under were various. As regards mechanical design there was nothing very seriously wrong with it, except for the absence of suitable springing and that there was an occasional want of adhesion on the part of the rear tyre, and, further, the latter was, in many cases, hopelessly inaccessible. The other objections were high price and the crying demand for sociable seats. In the early days it was quite easy to turn out a single-gear fore-carriage, as the earlier form was called, at a very low price indeed, but it was somewhat under-powered and unsuitable in many ways. The tricar gradually became more and more car-like, and, in doing so, became more efficient and naturally more expensive, and in many cases more unwieldy. The same development is about to occur with the cyclecar unless it be nipped in the bud.

It is possible to turn out cyclecars at a moderate price, but only by making great sacrifices and laying down an enormous plant and by keeping the prices down almost entirely through a very large output. Now, had the tricar been made in any quantities it would have been possible to sell it at twenty or thirty pounds cheaper than was actually the case, and we think it just as well for those who are engaged in the industry to know this. We have the assurance of more than one prominent manufacturer that a well-designed multi-cylinder cyclecar fitted with a good system of transmission, three speeds and reverse, differential, etc., can quite well be manufactured at under a hundred pounds, provided motor cycle lines are adhered to.

I LEFT Nottingham at 4.30 p.m. on Friday, the 13th ult., to join the A.A. party at Cambridge at seven o'clock, and thanks to the A.A. scouts I was enabled to arrive in good time. At the Lion Hotel a dinner had been arranged so that we might have an opportunity of getting to know one another. After dinner Mr. Cheeseman handed out our unit cards, and, together with five other motor cyclists, I was attached to Neutral Signals with Director of Manœuvres, and had to report to Captain E. G. Wace, R.E., Lion Hotel, at noon next day, and that we were to be boarded at Ye Olde Castel Hotel—pleasant news, as it meant no bivouacking in the open.

Before reporting, we decided that it would be a good idea to take a ride out of Cambridge to get to know the various outlets to the town, so that when we received despatches there would be no difficulty in getting away quickly.

The six of us reported to Capt. Wace, who numbered us as follows: Farnsworth (Rover, three-speed), No. 1; Gates (8 h.p. Matchless), No. 2; Symes (Triumph F.E.), No. 3; George (Douglas two-speed), No. 4; Wardle (Rudge F.E.), No. 5; and Spence (D.O.T.T.T.), No. 6. Capt. Wace issued maps and blue and white armlets (Neutral), and told us to report again at six o'clock in the evening. Myself and No. 2 were then sent out with test messages against the telegraph (this we did not know at the time). I was sent to Clare, thirty miles distant, and beat the telegram by several minutes. The Matchless rider had to go to Great Yeldham, thirty-two miles, and he was only one minute too late. Our report officer considered this very good work, as when we started it was 6.50 and quite dark.

#### A Heavy Night's Work.

SUNDAY.—Rover and Matchless were free until noon and paid a visit to the Royal Flying Corps Camp at Hardwick. We were allowed to inspect the flying machines in the hangars, and had numerous details explained to us. Triumph and Douglas were out after lunch, and I came on after six o'clock and had to take three despatches—one to the Chief Umpire at Newmarket, one to Col. Wintowe at Stradishall Place, and the other to Lord Roberts at Stetchworth. Starting out from Cambridge at 8.30, my first despatch was easily delivered, but Stradishall Place was about seventeen miles away on by-roads. My lamp would not burn properly, and at 11 p.m. I was several miles from my destination. I knocked a police sergeant up

and

and he put me on the right track. I eventually found the house in the middle of large grounds at 12.15 a.m. I knocked the door and got the receipt signed by the butler, and was soon off back to Newmarket to find Stetchworth and Lord Roberts. Refilled the lamp and it burned slightly better; arrived Stetchworth 1.45 a.m., and found his Lordship in bed; landlady signed my receipt. I started back to Cambridge and ran out of petrol; pushed machine about two miles to nearest cottage, woke up its occupants, and obtained some paraffin. Though the engine was quite cold it fired within three yards, and I ran splendidly into Cambridge, arriving there at 2.45 a.m., after covering nearly ninety miles, all unknown country on a pitch dark night.

MONDAY.—Despatches to Chief Umpire at Newmarket and to Capt. Dillion, A.D.C., to Lord Roberts at Stetchworth, and ran through large bodies of troops on the move. Our other riders were not very busy to-day.

TUESDAY.—Sent with despatches to Saffron Walden to try and find the Fourth Division of the Blue Army, as their whereabouts were unknown. I rode from camp to camp and round the country lanes but could not find them until night, and then I came across them in some fields bordered all round with woods. Retraced my steps to Cambridge and found despatches waiting for me to take to the Second Division. I went out to Haverhill, and met several regiments on the move and many more were bivouacking close to the road. From Haverhill I went on to Hunsdon. A whole brigade of artillery were bivouacked here, and a few fields further on the Brigade of Guards, but no tidings of the Second Division until I got to Stradishall; then I heard they were near Farley Green. I succeeded in finding the O.C. and delivered my despatches, but

**With the Combined Armies—**

the trouble was how to find my way back to Cambridge, as it was a very dark night and we were in the heart of the country. Thanks to my F.R.S., which gave a splendid light, I worked across to Newmarket, and from there it was easy going to Cambridge.

**Delivering Messages until 3.0 a.m.**

After supper I started out with a despatch for Lord Haldane at Babraham Hall. Again I had great difficulty in finding my way, as it was very foggy and my lamp was very bright. I turned the hood right down, but I could only go at 5 m.p.h. on bottom gear and using the clutch as well. When I eventually found the Hall it was 1.15 a.m. and everybody in bed. I managed to get the butler down, and from there I went on to Linton Camp. I found them very wideawake, as their transport had got lost and they had had no food since morning; scores of them were walking about to keep themselves warm. I arrived back at Cambridge at 3 a.m. thoroughly tired out, and the big day coming on Wednesday.

WEDNESDAY.—The headquarters were moved out of Cambridge to the cross-roads between Linton and Horseheath, and we had to report there at 9 a.m. We had great difficulty in getting there, as the roads between Abingdon and Horseheath were one continual stream of troops. By this time we had acquired a very martial air and felt quite above civilians. On arrival at headquarters we found that a big battle was expected at or near Horseheath, and the sixty-pounders were hard at work by ten o'clock. I was sent with a despatch to General Robertson and told that he would probably be at Wigmore Pond. I came across two ammunition waggons jammed in the narrow roadway and banks on either side, so I had to wait a few minutes. I told the officer in command for whom my despatch was, and he had the road cleared for half a mile so that I could get through as quickly as possible.

On returning to headquarters I had to take a despatch to General Henderson, who was with Sir John French. I found them at Horseheath with Sir Douglas Haig, C.-in-C. of the Red Army. The great battle was at its height, and I spent an hour in the midst of the troops and saw Horseheath captured by the Reds and retaken by the Blues. General Allenby, Chief Inspector of Cavalry, told me that what surprised him was the ability of motor cyclists to go anywhere. On returning to the report centre I found that the other motor cyclists had not been so fortunate as myself, as they had been away from the battle.

**A Message to the King.**

At 4.30 Sir John French asked for motor cyclists to go out and find the King and bring him to headquarters, as they wished him to sound the cease fire. I was one sent out. After riding about three miles towards Balsham I came across the King's cars. I

asked if they knew where the King was, but they did not, and wished they did, etc., as they had not seen him for over an hour. I rode on towards West Wickham about 1½ miles, and actually came upon the King and his staff. I jumped off my machine, saluted, and told His Majesty that Sir John French wished him to ride to the headquarters to sound the cease fire. I had the honour of riding in front to show the way. Naturally I was very pleased, and was congratulated by Capt. Wace on being the fortunate one. We then stood at attention while several brigades marched past. We left headquarters at 7.30, and I again ran out of petrol and had to invest three-pence in paraffin, which carried me on to Cambridge to a well-earned dinner.

A group of motor cyclist despatch riders at their annual camp. The figure standing is Leon Cody, Colonel Cody's son. In the background is Commander Sander's biplane.

On the Thursday I had despatches for Surgeon-General Robertson, Haverhill Camp, or wherever he might be. I located him after covering over thirty miles of country. Calling at a country public-house, I found a dozen or more officers eating bread and cheese and drinking beer out of pint mugs. What a change from Piccadilly!

**A Strenuous Week.**

At 8.30 p.m. I started out with despatches to Wimpole Park Camp, and had rather a difficulty in delivering them, as I found several regiments encamped there, and I had to find each O.C. Arrived at 11 p.m., and with the aid of my pocket flash lamp, I managed to locate them all. We were on duty until Friday morning, but had nothing further to do, this finishing a most enjoyable though strenuous week. I look back on it as one of the events of my life. During the week my milometer registered 678 miles. Capt. Wace thanked us all, and said how pleased he had been, and that we had been very successful during the manoeuvres. He thought that we were one of the best units attached to the Army, that none of us had had the slightest trouble (not even a puncture), and that every despatch was delivered promptly and to the right person, and he hoped that we should all be under him again next year, only, instead of being sent by the A.A., we should be a proper unit of the Army—a reserve corps—now that the War Office had found what we were really capable of.

J. FARNSWORTH.

## QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Loss of Power.

**?** I have a 2½ h.p. a.o.i.v. motor cycle with accumulator ignition. Each time I go out for a run it stops every two or three miles. It recently took me three hours to go twelve miles. If you could suggest a remedy I should be very grateful. I can give it very little extra air without throttling down the engine. It very easily overheats. The petrol blows back into the carburetter, which is a 1911 B. and B. I may say that I recently had new connecting rod and timing gear fitted.—J.W. (Innerleithen).

As to what the ignition trouble is we cannot tell you. Accumulator ignition is, unfortunately, very unreliable, as there are numerous loopholes for short-circuiting. The only thing to do is to look over the wiring carefully, and see that your accumulators are up to the mark, and that every connection is sound. With regard to the petrol blowing back into the carburetter, we should say that this is caused by too weak an inlet valve spring, or to the inlet valve having too great an opening.

### A Sluggish Starter.

**?** I have a 2½ h.p. Zedel engine, and cannot get it to start. It has accumulator ignition. The accumulator has been recharged, and shows full voltage; the wiring is apparently sound. I have fitted a new high-tension wire and new plug. The compression is excellent, the timing is correct, and the carburetter is clean. I might also mention that I get a good spark on any part of the machine from the high-tension wire, when contact is made by revolving the engine. Everything, as far as I can see, is quite in order, and yet I cannot get it to start.—E.W.D. (Uxbridge).

The trouble may not be due to the ignition at all, as you get an excellent spark. Probably there is a bad leak in the inlet pipe, allowing too much air to enter the cylinder. If you overhaul your carburetter and its connections, you will probably find the cause of the trouble. If you have had the carburetter down and re-assembled it incorrectly it might cause the symptoms.

### Darlington-Bradford-London.

Will you please let me have particulars as to best route from Darlington to Bradford and from Bradford to London?—T.P. (Morpeth).

**?** Your best route would be as follows: Darlington, straight on to Leeming Lane, then through Scotch Corner, Leeming, Ripon, Ripley, Leathley, Otley, and Bradford. From Bradford to London your route would be through Wakefield, Doncaster, Retford, Newark, Grantham, Stamford, Stilton, Buckden, Eaton Socon, Biggleswade, Baldock, Stevenage, Welwyn, Hatfield, Barnet, and Regent's Park, London.

### Timing of Exhaust Valve and Magneto. Warwick to Putney Bridge.

**?** My machine has a 2½ h.p. a.o.i.v. J.A.P. engine. (1.) Is it possible to prevent the inlet valve from clattering? Altering the tension of the spring does not seem to have any effect. (2.) Relatively to the position of the piston, when ought (a) the exhaust valve commence to lift? (b) the magneto points commence to break? (3.) Ought there to be any "side play" at the big end of connecting rod? (4.) Would this account for a slight fouling of the flywheels by the connecting rod? (5.) Which is the best route from Warwick to Putney Bridge?—H.E.P. (Shrewley).

(1.) If altering the tension of the spring does not prevent the valve from clattering, try placing a washer between the cotter and the collar of the valve, thus reducing the opening. (2.) The great thing is to note where the exhaust valve closes. It ought to close on the top of the exhaust stroke or a few degrees past dead centre. The magneto points are about to break when the spark is fully retarded and the piston is dead on top of the compression stroke. (3.) A certain amount of side play in any of the bearings does not matter. Vertical play, of course, must be avoided. (4.) Excessive side play might cause the fouling of the flywheel by the connecting rod, and in this case matters should be looked to. (5.) Your best route would be as follows: Warwick, Banbury, Deddington, Bletchington, Islip, Wheatley, Stokechurch, High Wycombe, Beaconsfield, Uxbridge, Acton. At Askew Road turn right and follow the trams to Hammersmith Broadway. Cross Hammersmith Broadway and follow trams to Putney Bridge.

TOURING IN THE PEAK DISTRICT. A scene on Castleton Hill, one of the most picturesque spots in Derbyshire. Observe the road winding away in the distance.

## Aldershot to Windermere.

? Will you let me know—(1.) The best route from Aldershot to Lake Side, Windermere, avoiding large towns if possible? (2.) The distance? (3.) Is it too long a journey for one day on a  $3\frac{1}{2}$  h.p. single? I do not want to do any night riding, but should not mind starting early.—L.H.R. (Dover).

Your best route would be as follows: Aldershot, Odiham, Reading, Streatley, Wallingford, Shillingford, Oxford, Woodstock, Shipston-on-Stour, Stratford-on-Avon, Alcester, Bromsgrove, Kidderminster, Bridgnorth, Wellington, Whitchurch, Tarporley, Warrington. Here ask your way to Prescott, and go through Rainford, Ormskirk, Rufford, Preston, Garstang, Lancaster, Kendal, to Windermere. The journey is almost too long to be undertaken in the day at this time of the year. What we should advise you to do is to start at daybreak and get as far as you can in one day, and then complete your journey the next day.

## A knock when picking up speed.

? At the end of July I bought a brand new T.T. machine of well-known make, and now, when I start, or pick up after turning corners, it knocks a great deal if I do not retard the spark. The engine is quite free from carbon deposit, and is always kept perfectly clean. The gear is 4 to 1. (1.) What is the cause of this? The machine runs very well, but is not as fast as I should like it to be. (2.) Will a long exhaust pipe make much difference? (3.) Will an extra air pipe to the carburetter make any difference?—R.E.S. (Woking).

(1.) The symptoms may be due to a loss of compression since the machine was new. Inspect the valves and seatings. Probably the best way to get it tuned up would be to send it to the makers, or write to them for advice. (2.) The long exhaust pipe certainly causes less back pressure than a silencer. (3.) This depends upon the adjustment of the carburetter, though a long pipe does seem to effect an improvement, chiefly in consumption.

## Carburetter too close to engine.

? I should be glad of your advice on the following questions: (1.) Should a B. and B. carburetter on a  $3\frac{1}{2}$  h.p. J.A.P. engine get too hot to be touched with the hand in a short ride of, say, four or five miles with sidecar? If not, what is the probable cause? The compression is good and the inlet valve in good condition. Is there any danger of the carburetter catching fire? (2.) Does vaseline or grease damage the covering of Bowden wire? (3.) What is the best way to keep the accumulator of an electric light set when not in use, i.e., laid up for the winter?—AT 1146.

(1.) The fact that the carburetter is hot may be due to its proximity to the engine, and perhaps to too strong a mixture. There should not be any danger of fire. (2.) No; vaseline or grease does not damage the covering of Bowden wire. (3.) Really the best plan is to get it charged from time to time; otherwise, you may run down the cell through a lamp and fill it up with distilled water.

## Broken Window.

? I have had the misfortune to have a small smash with my cycle and sidecar. The facts are as follows, and can be borne out by an entirely independent witness. I was taking the machine back to the garage and was proceeding about two or three miles per hour (the machine was going on its own momentum), and I blew my whistle in turning up the road to the garage. One man would not give way to me, but seeing that I was in danger of doing serious damage to some shop windows at last gave in, but too late to allow me to get round the corner. I managed to swerve and avoid knocking him down, but my machine took the kerb and the sudden swerve of the front wheel sent the handle-bar through the window. I must add that the kerb at this point is only about 2ft. or 2ft. 3in. wide. The very fact that the machine is not scratched beyond the lamp glass broken, and that I myself did not get any cuts, prove that I used all reasonable caution and care, and that the speed was not excessive. I am an experienced driver and have driven and owned four

L'Automobilette, the French tandem seated cyclecar described on page 1094 last week. The engine is a twin cylinder water cooled pattern, the radiator being wedge shaped.

machines. The insurance company (the windows are insured) have sent me a letter saying that they will put through a bill for replacement in due course. Before acknowledging their letter I should be glad if you will advise me if they have any claim against me, and whether I should repudiate responsibility. My witness saw the whole affair and came voluntarily to offer his services.—A.A.

Our legal adviser writes as follows: "If the court is satisfied that the facts as stated by your correspondent are correct, I think the insurance company would have great difficulty in obtaining damages. At the same time, details as to how the accident actually occurred are rather meagre, and when a motor cyclist turns from the road to cross into premises, it does not necessarily follow that he must expect pedestrians to stand still while he crosses. It is just as much the business of a motor cyclist to get off and walk it across the pathway as it is for the pedestrians to be on the look out. I think the proper plan is for your correspondent to dispute all liability, and then if the insurance company proceed he

should go with his witness to a solicitor and take his advice on the matter. In order to succeed, the insurance company must show that your correspondent was negligent or careless in his riding, and this is a question of fact which can only be settled by hearing the evidence on both sides."

## Petrol Consumption.

? I have a  $3\frac{1}{2}$  h.p. James motor cycle with an Amac carburetter and sidecar. I can only go fifty-five to sixty miles on a gallon of petrol. The engine is in good trim. I might say that with throttle lever about a quarter open or less I can fully open the air lever without the engine misfiring. I use a No. 32 jet, and if I use a smaller I cannot get sufficient power to finish hills.—J.A.C. (Wolston).

Failing the use of a smaller jet you must increase the air supply, as at present there is insufficient when the throttle is open. If the machine is really pulling well it would be hardly worth while your upsetting things for the sake of saving a few pence on about every hundred miles of travelling. As a matter of fact, an average of 60 m.p.g. with a sidecar and engine of 86 x 96 mm. is good.

## EXPERIENCES WANTED.

"Waverley" (Reading). G.W.K. cyclecars, for business purposes.

"M.M." (Ecclefechan). A.C. Sociable, particularly with regard to the carbonisation of engine.

"X.Y.X." (Lewes).  $3\frac{1}{2}$  h.p. 1911 two-speed Humber with sidecar.

"S.W." (London).  $2\frac{3}{4}$  h.p. two-speed Douglas. Reliability and power after 5,000 miles.

"L.C.D." (Wolverhampton). T.M.C. and 8 h.p. water-cooled Williamson for solo and sidecar. Reliability and running costs.

"H.R." (Scalby). No. 7 Chater-Lea and sidecar. Tyre wear and petrol consumption.

"T.B.R." (Cleethorpes). Clyno and T.M.C. sidecars. Wear and reliability.

"A.P." (Bristol).  $4\frac{1}{2}$  h.p. Excelsior and 5 h.p. Rex de Luxe with sidecar.

"W.H.W." (Willesden). Roc and other two-speed gears suitable for 8 h.p. and sidecar.

"W.H.E." (Armagh).  $2\frac{3}{4}$  h.p. Winchester. Hill-climbing and petrol consumption.

"F.W.C.G." (Fremington).  $3\frac{3}{4}$  h.p. Scott with sidecar. Retention of crank case compression.

If "Novice" (Northampton) will send a stamped envelope together with his name and full postal address, a reply will be sent to his query.

## "The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates:—Unmounted prints, half plate,  $1/6$  post free; mounted,  $1/9$  post free. This refers only to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

# AN UNOFFICIAL 1,000 miles TRIAL

The Sychnant Pass from Dwygyfylchi.

A stop for petrol at St. George's, near Wellington.

A bend on the Sychnant Pass, Penmaenmawr mountains in the background.

On the steepest portion of the Great Orme, Llandudno.

On many occasions have wordy warfares raged in these columns on the subject of single-cylinder machines for sidecar work, the majority contending that the  $3\frac{1}{2}$  h.p. mount is not sufficiently powerful for general touring requirements. Such may be the case with engines of under 500 c.c., but after a tour extending to nearly a thousand miles, and embracing North Wales, the Midlands, and the South Coast, mounted on a James of 558 c.c., the writer can state emphatically that every  $3\frac{1}{2}$  h.p. cannot be saddled with the verdict above mentioned. True, it had a three-speed counter-shaft gear and enclosed chain drive, and was, in fact, a 1913 model, which accounts for why it came into my hands last month to undergo test.

Starting away from Coventry soon after 10 a.m., good going was made *via* Stonebridge to Castle Bromwich, and along the Watling Street to Cannock Chase and St. George's, where the first stop was made for petrol, and the run continued *via* Shrewsbury (the second speed being brought into operation on Wyle Cop) to Llangollen. On this latter section, the engine, which it may be observed was brand new, in addition to the bicycle and Canoelet sidecar, refused to climb as before, demanding the air lever to be almost closed—a sure sign of a choked jet. This rectified, Chirk and Llangollen soon hove in sight, and the long ascent to Corwen climbed mostly on top gear. The road surface hereabouts deteriorated rapidly, thanks to motor 'bus traffic, and there was no possibility of dodging the pot-holes, for they abound everywhere.

## Caution required in Wales.

It rained sharply when nearing Bettws-y-Coed, but the machine climbed gaily on top gear the rise leading to Llanrwst. In this town I was disgusted with a police officer who, gossiping and joking at an acute bend with two yokels, was entirely unconcerned when a motor char-à-banc swung round at over the 10 m.p.h. limit without sounding a horn, and only just left room for the sidecar to squeeze through. In this connection I should like to warn readers in their own interests to travel most cautiously in Wales, for few heed the rules of the road, and drivers of public vehicles seem the worst offenders.

The wind increased in violence as we neared the coast and our objective—Llandudno. The run had proved most enjoyable, our only involuntary stop being to clear the jet. It did not take long for me to realise that in the 1913 James I had a machine of the first

**An Unofficial 1,000 Miles Trial.—**

water, and as for the multi-plate clutch I was soon full of praise. It is exceptionally smooth in action, and would start the combination on the middle gear with ease. Our average, including all stops, was  $19\frac{1}{2}$  m.p.h. Some facts and figures may interest the economically minded. The journey of approximately 150 miles was accomplished on less than three gallons of petrol and one quart of oil, say 6s. 6d. for two persons, which result was equalled on the return journey. But what a boon it is to have a motor of some description at a seaside resort and be independent of trains and chars-à-bancs! Nearly every day the James was on the road, my wife and I visiting most of the interesting places roundabout, and much more cheaply than the ordinary methods of conveyance would have entailed.

The 1913 model James with three-speed counter-shaft gear and kick starter, also chain drive with grease bath chain cases.

**An Ascent of the Great Orme.**

We climbed the Great Orme by the coast road on second gear, but, not satisfied with this achievement, attempted the ascent by the tram track, which boasts two sections of 1 in  $3\frac{1}{2}$  gradient. For 300 or 400 yards the engine tugged gamely on its lowest ratio, but came to a full stop at the gate, this with our touring tackle aboard. My passenger was so thoroughly frightened that she positively refused to try a second ascent, so descending, I made an attempt with the sidecar empty. I had chanced to meet a friend, Mr. T. Blyth Clayton, of Birmingham, who, lucky man! had his Wolseley car and Bradbury motor cycle with him. Being a camera man, he stationed himself about halfway up. Securely tightening the engine valve caps, which had a habit of working loose, and injecting two charges of oil, I turned a deaf ear to the tram conductor, who assured me that dozens of motor cyclists try but few succeed, and commenced the climb. The ascent was comparatively easy this time, however, for relieved of the weight of the passenger, the James engine turned over merrily, and the speed of the machine was only governed by the lumpy road surface. The second pitch of 1 in  $3\frac{1}{2}$  near the top demanded full throttle and a retarded spark, but there was never any doubt of the machine's ability to accomplish the ascent. I climbed Beggar's' Roost in

Devonshire a month previously, but I do not consider it quite so steep as the Great Orme, and the performance left me with a great respect for the capabilities of the  $86 \times 96$  mm. 1913 model James. Mr. Clayton's three-speed Bradbury was not geared so low as mine, but he reached a point about 200 yards from the top. The descent proved a genuine brake test, but again our trusty mount was not found wanting.

Another climb worthy of special mention during our travels—especially as it was the only main road climb calling for the lowest gear ratio—was the Sychant Pass, between Penmaenmawr and Conway. On the low gear, loaded as we were with touring kit (and not forgetting a Blenheim spaniel who loves motors), the engine did not seem distressed in the least when we slowed down to a walking pace in order to pass two horse brakes, and then opened out again.

**Through the Centre of England.**

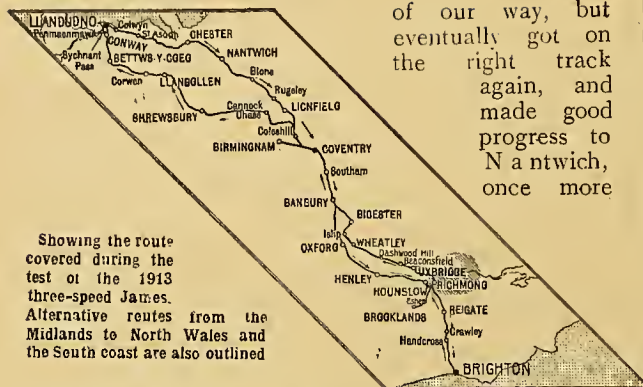

Being keenly interested in the 150 miles race to be held at Brooklands on the Saturday following, we set out for Coventry on a Tuesday, this time preferring the route *via* Colwyn Bay, St. Asaph, and Chester. In parts the road surface was frightfully cut up, and only a staunchly-built sidecar could stand incessant bumping such as we endured. After lunch in Chester, we took the wrong turn and went several miles out

COAST SCENES IN NORTH WALES DURING THE  
1,000 MILES TRIAL OF A 1913 JAMES.

## An Unofficial 1,000 Miles Trial.—

of our way, but eventually got on the right track again, and made good progress to Nantwich, once more

overshooting the turn for Stone and Rugeley, and finally reaching Coventry by way of Lichfield and Coleshill, the steep hill in which town was actually climbed on top gear with a hot engine. Again the average worked out at approximately 26 m.p.h., inclusive of stops, the machine several times attaining a speed of 40 m.p.h. on secluded stretches of road. The James continued to run as regularly as ever, but I thought it time to tighten the driving chain slightly. Grease retaining cases entirely enclosing the chains are a fea-

ture of the transmission, and I noted with pleasure that every link was well greased whenever I peered inside the axle hole. I have only one fault to find with such complete cases, and that is that they prevent one testing the chain tension. Inspection windows seem desirable.

## Along the Thames Valley.

Next morning the journey to town was commenced, but the run *via* Banbury, Oxford, Henley, and Maidenhead was just as featureless as formerly, except for a sooted plug to vary the monotony. A day at Brooklands proved a welcome change, though we came away having seen and heard of every imaginary engine trouble, and during the run back to town in the dark we were haunted by visions of broken valves, pistons, connecting rods, and seized engines. Any reader who desires to retain a good opinion of the reliability of motor cycles should on no account deign to watch a long-distance race on Brooklands. Is it in the air, I wonder?

A run to Brighton next day in company with an owner of a 6 h.p. twin-cylinder two-speed sidecar served to demonstrate the advantages of three gears over two in hill-climbing. Not only would the James on its middle gear rapidly overhaul the two-speeder, which on gradients of 1 in 10 to 12 was either labouring on its high gear or hopelessly undergeared on the

Ascending the Great Orme, Llandudno, by the tram track The gradient at the point in the left hand photograph is 1 in 24.

**An Unofficial 1,000 Miles Trial.—**

low, but it was very little slower on the level, as the adoption of a three-speed gear enables a higher top ratio to be selected. There is no acclivity on the famous London-Brighton road worthy the name, which may account for our average speed being so good (24 m.p.h.), but Handcross and Reigate on the run back necessitated a change down. Near Reigate misfortune befell my companion, for the locking rings of the rear sprocket came undone and caused some damage. Being dusk, it was resolved to leave the machine for the night, and the only thing to do was to find a seat for the driver on the carrier of the James and for the passenger in the sidecar. Thus we progressed with four up the twenty miles to Richmond, but even under such severe treatment as this the engine did not cry out, and there was no need to stop and cool down, as would certainly have been necessary not many months ago. The James won another golden opinion that night, and again next day when it transported its owner and a partner of the Holbrook Garage, Richmond, to the scene of the mishap. Matters were soon righted on the twin with the assistance of daylight.

**Over the Old Quarterly Trials Course.**

In order further to vary the roads traversed I selected another route home to the Midlands, *via* Uxbridge and the old Quarterly Trials course to Banbury. My chief object was to try Dashwood Hill, which regularly stopped motor bicyclists in the trials, but with a hot engine we got to the summit comfortably on middle gear, which is surely testimony to the lasting qualities of the engine, for it had not had a

valve touched, or in fact any adjustment since the start fourteen days' previously. The final jaunt to Coventry and Birmingham needs no special reference, for the machine pulled as well as ever, and I parted with it quite reluctantly.

**Summary of Experiences.**

Handing the combination over to Mr. A. D. Arter, I learned that it had no special shock absorbing mechanism other than the clutch, yet the flexibility of the engine had hidden this fact from me. The only point one can criticise is the change-speed lever, which may appear somewhat cumbersome, though easily manipulated after a little practice. I like the foot-controlled clutch, and once as a test actually started from a standstill on a gradient of 1 in 5 with the sidecar loaded. The kick starter is well designed and substantial, sturdiness being a feature characterising the whole outfit. The petrol consumption may appear rather high—50 to 55 miles per gallon—but a smaller jet than the one I had could be used with impunity. The engine, too, it must be remembered, is nearer 5 h.p. than  $3\frac{1}{2}$  h.p. The chains were still smothered with grease when I parted with the machine, so there is no doubt about enclosed chain drive being a distinct advantage. As for the Canoelet sidecar my passenger speaks in high terms of praise; the new waterproof scuttle distinctly enhances its appearance and comfort. I suppose I must have been in luck's way, for though the James had three different makes of tyres on—a Dunlop sidecar, Palmer front, and Rom rear tyres, I had no punctures or trouble at all. The fact is that if in 1914 my holiday tour is as enjoyable and free from trouble I shall be contented. G.S.

**A RUN ON A WALCYCAR.**

ONE day last week Mr. A. W. Wall, the maker of the Walcyar (a new title), illustrated in *The Motor Cycle* of July 25th, called at our offices to take us for a short trial run on the latest model. Mr. Wall was careful to explain that it was not his intention to indulge in any record-breaking hill-climbing feats or speed attempts: he merely wished us to gain an impression of what the vehicle was capable of under ordinary riding conditions, particularly with regard to the comfort of the body and the springing. The run embraced about twenty-five miles of Warwickshire roads, and when we say that the road from Coventry to Warwick constituted part of it, we have said sufficient about road surfaces to prove that if the vehicle were comfortable when driven over this road it would be luxurious practically anywhere else. It was only when the wheels went down into an exceptionally large pot-hole that one felt the bumps unduly.

The secret of the springing of the Walcyar is that the frame is sprung from the wheels, and in addition the body is supported by a second set of springs which insulate it from engine vibration.

The Walcyar is possessed of a fair turn of speed, and presents quite a natty appearance. The springing is exceptionally good for a low priced runabout of this description, and we have no fault to find with the amount of space provided in the body. We took the driver's seat for a short distance, and found that the steering was quite easy and the control quite simple.

It cannot be said for a cyclecar that it holds the road like a big and heavy four-cylinder car, but the Walcyar steers quite well enough for the speed such a vehicle is able to attain with comfort to the passengers. The control of the engine would be improved were it provided with an automatic carburetter, but, of course, the engine being of the motor cycle class, viz., a V twin Precision, it is fitted with the standard carburetter supplied with variable hand-controlled throttle and air. The fitting of an automatic carburetter would, however, be a very simple alteration, and one which we know Mr. Wall would undertake for anyone who desired it.

The Walcyar can be supplied with an 8 h.p. twin J.A.P., 85 x 85 mm., or a 6-7 h.p. M.O. twin Precision, 75 x 80 mm., both air-cooled engines.

The standard gear ratios are  $5\frac{1}{4}$  and  $10\frac{1}{2}$  to 1, and the starting of the car and change of speed are effected by means of two pedals. This simplifies the control immensely, because in the case of a pure novice he need not concern himself with the control of engine speed, valve lifting, or similar methods employed for easy changing of gears. All he has to do is to start the engine, depress the low speed pedal, and when the cyclecar is under way release the low speed pedal and apply the high speed. We estimated our average speed to be 25 m.p.h., and a top speed of 35 m.p.h. was possible without unduly accelerating the engine. No speedometer was fitted or we should have been able to make a more accurate statement.

## NEW CYCLECAR RECORDS.

A G.W.K. breaks the Hour and Fifty Miles Records.

ON Wednesday afternoon at 2.27 p.m., J. T. Wood set out on an attack on the hour, fifty miles, two hours, and 100 miles records on Brooklands Track. The day was fine and a light north-easterly breeze was blowing. Started by Mr. A. V. Ebbelwhite, the G.W.K. went off in excellent form; thanks to the friction drive, which enabled the driver to raise his gear gradually as the speed increased,

J. T. Wood on the starting line. Observe the streamline tail on the G.W.K. cyclecar.

but was a long time completing the lap, so that it was evident that some trouble had been experienced. When Wood arrived it transpired that the plug below the main jet of the Zenith carburetter had fallen out. Fortunately, the ingenious driver was not long in discovering that a sparking plug would fit the orifice, but unfortunately the particular plug used was too long and the joint was not petrol tight.

### Over Fifty-five Miles per Hour.

Luckily, *The Motor Cycle* representative unearthed a Sphinx Gnat plug, and having filed off the points and fixed a washer we offered it to Wood, who found it an exact fit, and, having tested it on a trial lap, started

on his record ride at 2.50. His first lap (standing start) was covered at the rate of 49.72 miles an hour, and his next lap at 53.99. For the first few laps (excluding the first) his average was 54 m.p.h., and in the tenth lap he managed to attain the excellent speed of 55.15 miles an hour. This looked extremely hopeful, but, unluckily, a plug failed in the fifteenth lap, necessitating a stop. His next flying lap was reeled off at 50.96 miles an hour, which speed he improved to 52.05. Despite the stop the hour record was broken by 2 miles 886 yards, as against the Bedelia's performance on the previous Friday of 45 miles 504 yards. Fifty miles were covered in 1h. 2m. 32s., previous best Bedelia 1h. 6m. 29s. Wood then continued in an attempt on the two hours' and hundred miles' records, but was forced to stop at the twenty-fifth lap, owing to a cracked water jacket, due to a leak at the water pump connection. The G.W.K. is propelled by a twin-cylinder vertical engine.

A stop to inspect a leakage in the water jacket.

BY 'IXION'

### The Improvement in Free Engine Clutches.

A few years ago a very sensitive toe was necessary to effect a clutch start on the level with the best free engines then on the market. To-day many a novice starts a single-gear clutch model with ease and smoothness at his first essay. Perhaps the main need of the present day is a really perfect handle-bar clutch control. The fingers are always more delicate in manipulating controls than the foot can ever be, especially when it is shod by a great hob-nailed boot, and the one-leg balance of the machine is a trifle precarious.

There are several fairish handle-bar clutch controls on the road, but I cannot help thinking that there is still room for improvement. Clips twist on the bar, ratchets strip, and the heavy leverage is usually tiring to the fingers, and apt to disturb the steering. I do not see why we should not eventually obtain a handle-bar control which will be as easy as opening the throttle. The rawest novice would then be able to effect low-gear restarts on precipitous gradients, while balancing his machine with both legs straddled, and both feet on the road.

### The American Saucer Track Smash.

The later American press comments on the terrible saucer track smash at Newark, N.J., are not pleasant reading. It is alleged that Hasha had been in the doctor's hands for a week past, and only started in the race under pressure from the management. These saucer tracks are not technical testing grounds; they are rather a kind of open air music hall, run simply and solely as money-making affairs, and for Hasha to be on the track and not to turn out was as awkward for the management as a night's indisposition of Harry Lauder would be for a hall where he was billed, or Hamlet with the part of Hamlet omitted. A racing veteran, Frank Hart—the man whose leg was broken in the smash he had with de Rosier last year—was standing just opposite the point where Hasha's machine ran amuck; he says Hasha fainted, and left hold of his handle-bars, so that his Indian simply swirled over the top of the steep banking, and ran round along the faces and chests of the spectators in the front row.

Allbright was close on his back wheel, and was knocked off the banking immediately; the wives of both men were present, and saw their terrible end. The same witness denounces the track management and the F.A.M. (a body corresponding to our A.C.U.) for setting six men, all capable of lapping at 90 m.p.h., to race on a track of the four laps to the mile type, on which there was only room for three men to ride abreast. Seymour, who was leading when Hasha fainted, covered two more laps before he could pull up, and this at the rate of little worse than ten seconds per lap.

After the smash the crowd stole most of the fragments of Hasha's machine as souvenirs. Hasha received a fee of £30 per night. Naturally the career of a saucer track racer is extremely brief, and men

are attracted to the work by the prospect of earning enough in two seasons to start in business.

The whole affair leaves a very nasty taste in one's mouth, and makes us hope that these morbid and perilous exhibitions will never become popular in Great Britain; they are too nearly akin to the gladiatorial shows of ancient Rome to be termed sport. There are few issues of the American motor cycling papers which do not record smashes on either the saucer or dirt tracks; in this accident six persons were killed on the spot, and a score more received serious injuries.

### Increased Taxation.

We cannot very seriously complain that a revision of motor taxes is impending; the present scheme bristles with absurdities. In our own field, a tenth-hand  $1\frac{1}{4}$  h.p. featherweight bought for, say, £10, and a brand new 8 h.p. with sidecar costing about £80, both pay the same tax. In the car sphere, a third-hand 50 h.p. 30 cwt. car, picked up at auction for under £100, pays a higher tax than a de luxe lightweight up-to-date chassis weighing, say, 17 cwt., bought brand new for £500. It may be questioned whether horse-power is the correct basis. I suppose the really fundamental principle underlying sound taxation is to discover the man with the biggest income and make him pay in proportion.

A horse-power basis is a roughly accurate method, since the more powerful the motor, the more it costs to run; but as the motor industry grows more adult and complex, it caters for the needs of two classes. In both car and cycle worlds you find the man who wants the maximum of power and pace obtainable for his money, and, side by side with him, another man who wants the absolute cream of design and workmanship, irrespective of speed and horse-power.

Taxation based simply upon horse-power misses this distinction. I expect the wisest compromise would be to tax machines bought as second-hand upon their second-hand price, or to reduce their taxable value by a certain percentage for each year of their life.

The Regal racing sidecar built by Smith and Woodhouse, Ltd., for track work. The chassis was illustrated in our last issue, page 1097.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### Winter Riding.

Sir,—The winter will soon be upon us, and I should like to call readers' attention to what I consider the best boots for keeping one's feet warm and dry. I am an all-weather rider, and find military leather riding boots over a pair of woollen stockings the thing. They keep out the weather, have no laces to collect mud, and are easily cleaned. At the end of a journey they polish up splendidly, and are neat in appearance. It is advisable to rub a little French chalk inside the boots—at the instep and just above the heel—when they will slide on and off quite easily. FRANCIS WM. FLEXMAN, JUN.

#### Rowdy Behaviour.

Sir,—It seems that certain motor cyclists recently amused themselves by "blinding" through a meet of staghounds on their low gears, with open exhausts, after which they proceeded to repeat the performance in front of a quiet hotel, which they afterwards entered dripping with mud and rain.

They have since boastfully owned to this behaviour, which inclines me to suppose them innocent. Surely the A.C.U. should take steps to investigate the truth of the matter, and, if it be proved, suspend the offenders indefinitely.

C. P. SYMONDS.

#### Suggested Revision of the Motor Acts.

Sir,—Surely the time has come now for one of our wealthy organisations to agitate for a drastic revision of the Motor Acts? Members would appreciate far more legal permission to travel at reasonable speeds in the country than the most ingenious and expensive scheme for outwitting the police. The excuse so far seems to have been that matters would adjust themselves automatically; no one can say this has been the case—on the contrary, ten-mile limits multiply monthly. This could be tolerated if accompanied by increased freedom on the open road, but even there we are submitted to split second timing in zealous endeavours to detect technical breaches of the law. Meanwhile, the guardians of our sport apparently remain apathetic. Can it be that they fear to lose members when the principal reason for the existence of their patrols and guides is past?

C.H.M.

#### An Appeal to Car Drivers to give Motor Cyclists More Room.

Sir,—Will you or any of the readers of *The Motor Cycle* suggest some scheme which will bring chauffeurs of large motor cars to understand the absolute necessity for giving motor cyclists, especially sidecarists, full share of the road?

It is the one danger completely out of the control of the motor cyclist, excluding mechanical troubles of course. Every now and then one sees accounts of accidents, motor cyclists colliding with motor cars, but very few of us are suicidally inclined, and I believe these collisions are frequently due to the careless and negligent driving of the larger cars, in that they will not go far enough to their own side of the road.

The sidecarist is squeezed to the very edge of the kerb, perhaps on to it, or some similar obstruction at the side of the road. This causes a wobble, the handle-bar touches some part of the car, and, in many cases, all's over. The story is then told at the following inquest by the survivors (always the car), and, *nemine contradicente*, it is accepted. I am quite aware of the seriousness of such a statement, and I am not making it in a light-hearted manner. I am making it after due consideration and after many unpleasant experiences—but fortunately without the wobble or handle-bar catching the passing car—but only because of luck in not striking the kerb, and just managing to keep the outfit in a steady course. No credit to the driver, however, for that, who quite unnecessarily compels one to go through these ordeals, with three, four, five or more feet to spare on his side.

MEDICUS.

#### A Hooded Sidecar.

Sir,—Having seen in your issue of the 12th ult. a motor cycle with sidecar having a special hood, apparently made in France, I venture to send you photographs of my sidecar with hood designed by myself and ably carried out by Messrs. Brownlow, of Leeds. The bodywork is of best canework and the latest torpedo design. The hood when up has a sloping front to cut the wind, with a tale window in it, also a ventilator opening behind. The front flap rolls up as shown in the photograph, and when down fastens on to the stays at the side and on the apron at the bottom. The machine itself needs no words of mine to praise it.

A.J.S.

An efficient sidecar hood designed by a Yorkshire reader. See letter signed "A.J.S."

## Single-cylinder Sidecars.

Sir,—I think I would like to give a small account of a three weeks' tour my wife and I enjoyed this August in spite of the delays of rain day after day. I first of all took delivery of a 1912 popular chain drive. From the moment I had machine trouble begun with a slipping clutch; this I had attended to by efficient engineers on no less than four different occasions, but the money I spent did the clutch no good. Not to be discouraged about a  $\frac{3}{4}$  h.p. and sidecar, I took delivery of a Rudge-multi, on which, in three weeks, I travelled, with my wife as passenger and two suit cases, 1,500 miles by speedometer, going over some of the worst roads in England and Scotland. During the whole time, the engine never faltered, nor did the belt slip through all the bad weather, which was, I think, partly due to the multi gear.

New York, U.S.A.

ALBERT PERRY.

## Change-speed Gears.

Sir,—I think "H.W.B." and others have rather misjudged the two-speed counter-shaft gear box. I have tried both hub and counter-shaft gears and find the latter much superior in many ways. The two machines that I have had with hub gears have given me trouble, the latter one especially. They may be all right for lightweights, but certainly not in the same street with the gear box for sidecar work. There are two very good reasons why hub gears are unsatisfactory. (1.) There is more power developed in the back wheel than in the counter-shaft owing to the gear ratio from engine pulley to counter-shaft being less generally than from the engine pulley to the back wheel, therefore more strain on the back wheel. (2.) There is more room for gears in the frame. Most of the good two-speed gears are larger without clutch than the hub gears with three gears and clutch. Change-speed gears are the coming thing—therefore why cramp them up into as little space as possible?

W.B.E.

## Substitutes for Petrol.

Sir,—I should like to have your readers' opinions regarding a device in connection with the use of paraffin instead of petrol.

At present, so far as I can gather, the carburettors made for use with paraffin make it essential to have a small petrol supply for starting the engine when cold. Do you think that by having a pipe fitted from the exhaust pipe to the carburettor (forced feed) it would remove the difficulty of starting a cold engine on paraffin? The feed pipe would have to be of sufficient length to cool the exhaust gas, I suppose, as in the case of the latest Martin-Jap machines. While the machine was run with the exhaust valve lifted, would there be sufficient power in the exhaust pipe to drive air through the forced feed pipe, thus making a high velocity past the jet? Would not this vaporise the paraffin sufficiently to enable one to start an engine on paraffin?

I should be pleased to hear if any of your readers have made this experiment, and whether the defects exceeded the advantages, or otherwise.

L. E. S. VAILE.

## Dilatory Attention to a Foreign Order.

Sir,—One or two letters have recently appeared in the columns of your valuable paper, showing how the American manufacturers are striving to push their machines and accessories into Canada, and is it really suprising, when one hears so continually the delay experienced in the delivery of the "British" manufactured articles?

On the 10th of April last I ordered through a large Calcutta firm, a six guinea speedometer from an accessory firm in London who advertise these articles, together with lamps and generators, and after waiting three months without receiving the article, wrote and asked the reason, and the reply was to the effect that they had sold out the make I required last Olympia Show and had not been able to get one from the makers since, but that they would execute my order in the course of the next week or so, but no further news up to the present.

The worst part of it is, one has to pay the usual deposit with order, and wait the manufacturers' leisure for the order to be executed. From the 10th April to 20th August should be sufficient time for the making of one speedometer.

Barrackpore, India.

DISGUSTED.

## Motor Cycle Taxation.

Sir,—I should like to say a word about the proposed alteration of the tax on motor cycles. If there is going to be any alteration, why not do away with the licence and put an extra tax on the petrol? Such an alteration would be just to everyone: all would pay in proportion to the use of the roads, also in proportion to the power of the engine. It would also be a good thing for the industry.

R. GREEN.

Sir,—I was astounded to read the paragraph relating to motor cycle taxation, which is most unfair to motor cyclists generally.

If the recommendation becomes law, an entirely different type of engine will be demanded to evade the tax. The outcome of the experience gained has brought about the general design of engine of to-day, which has approximately equal bore and stroke, and to compare and place on the same taxation basis with the motor car engine, with stroke twice the bore, is ridiculous. Again, the power developed by an air-cooled engine is twenty-five per cent. below that of a water-cooled engine of equal bore and stroke, and even that only for short periods.

The existing jigs, drawings, patterns, and in some cases special machines, will become a dead loss to the makers, except for renewal purposes.

To my mind, there should be some relation to the value of the machine in the basis of taxation, and I hope every motor cyclist will make an endeavour to combat this unjust proposal, even if it does not affect him, but for the sake of the poorer end of the body, motor cycling is the poor man's motoring.

BILL JACKS.

Sir,—Manufacturers of all twin sidecar and cyclecar outfits realise that the proposed taxation means the last straw to over half their customers. Do sidecarists know that with this additional imposition on top of our present taxes it will cost them 2s. 6d. every time they go out? I am taking the majority of sidecarists to be the week-end rider, whose average journeys would not be more than forty in the year. Has the fact been brought to this Motor Taxing Committee's notice that the majority of motor cyclists are just a working class of individual whose only hobby is his motor, for which he already pays too dearly?

J. TASSELL.

Sir,—It was with consternation that I read of the proposed increase in taxation of motor cycles. I purchased for £55 a second-hand motor cycle (8 h.p.) and sidecar. My yearly expenses are about as follows:

	£	s.	d.
Petrol, 60 galls. at 1s. 3d. (exclusive of tax)	3	15	0
Oil	...	...	15 0
Tyres and belts	...	...	8 10 0
Repairs, about	...	...	1 10 0
	£14	10	0

I already pay petrol tax (60 gallons at 3d.) 15s., driving licence 5s., motor cycle licence £1, total £2. It is proposed to increase this by £2 2s., or to £4 2s. Is it seriously thought that a person who can, by strict economy in other directions, pay £14 annually for his recreation, including use of machine on his summer holiday, also pay £4 2s. in taxation, especially having regard to the present inflated and unjustifiable price of petrol? I should like to see the petrol companies mulcted instead. It may be a slight matter to wealthy owners of large cars, but to the small fry it is a most serious thing. Even to those who can afford £80 odd for a first-class new sidecar combination it is oppressive. To the workman who picks up a small-powered second-hand machine for £12 or £15 the tax of £1 5s. is equally hard. A motor cycle and sidecar is a poor man's machine. I have about fifty rides per year. The taxes would be 1s. 8d. *per ride!* What with income tax, duties on tea, coffee, spirits, beer, and tobacco, servants' insurance stamps, employees' liability insurance, heavy rates, etc., the middle class (incomes, say, £300 to £600) is being crushed out of existence.

The man who keeps a dogcart and six horses (one for every day in the week, and must have an income of £2,000 or so to do it) gets off with 15s. for the dogcart. [Bridle horses also pay no tax.—Ed.] It is proposed that I pay £3 3s., or as much as the owner of a luxurious car, who may

afford £150 per year or more to keep it going. I bought my 8 h.p. machine solely to have power for hills, not for speed work, having found that a 3½ h.p. machine was no good for bad hills if a sidecar were attached. My speed, except on hills, is no greater with the 8 h.p. machine than with the 3½ h.p.

All I seem to get for my £2 5s. at present is a species of purgatory in riding over the twenty miles or so (out and home) of badly-kept suburban roads in getting to the country. I am sure the proposed increase, if made law, will be the most disastrous blow ever dealt to the motor cycle industry. The manufacturers and dealers will soon find this out. I for one shall have to give up motor cycling.

I would suggest that strong representations be made to members of Parliament by all motor cyclists and by the manufacturers and dealers, protesting against any increased taxation and asking for a reduction of the present tax of £1 in the case of machines under 500 c.c.

#### ONE OF THE SMALL FRY.

#### Three and Four-wheeled Cyclecars.

Sir,—Mr. B. H. Davies always makes interesting and usually instructive reading, but inasmuch as his article, "Points in the Choice of a Cyclecar," will probably be perused by prospective as well as actual owners of these vehicles, I am tempted to champion to some extent the three-wheeled variety, being an extremely satisfied driver of one over a distance of 1,100 miles. Firstly, with regard to the disastrous results or otherwise of a "burst rear tyre," I fear personal experience of such is nil, for in nine years' almost daily motoring vagaries on cars, cycles, and cyclecars, I have never had a burst tyre on the road, and hence the odds are against my three-wheeled friend letting me down for a similar cause. Secondly, I am very much in accord with his opinion that "the average motor cycle engine is not designed to tick over slowly." My cyclecar is engined with a very popular 8 h.p. air-cooled cycle engine, but it has a big flywheel, and it will "tick over slowly." When I took delivery of same, its racing propensities, in the free engine and when changing gear, were appalling to a sensitive driver; this difficulty I entirely overcame by the simple expedient of fitting my carburettor with a variable jet controlled by a lever on the dashboard. My driving involves constant stops (level crossings, etc.), and embraces hills above the touring average, but anything approaching engine racing is a thing of the past, and incidentally my petrol consumption has increased from fifty to sixty-two miles to the gallon.

In conclusion, I can, as a motorist of ample experience, anticipate no improvements that could render my own three-wheeler more efficient and more delightful to use, and I am amply repaid by the result for a weary wait of seven months before delivery.

FELICITAS.

Sir,—The battle of three and four-wheeled cyclecars has been fought on paper with spirit by both sides, but is it not time to ask for facts and not fancies?

A contributor to *The Motor Cycle* asks where would the rider of a three-wheeler be if his back tyre burst? From

regrettable incidents lately, it would seem that the fate of the driver of even a large four-wheeled car is not always a happy one in such circumstances. There are very many more three-wheeled cyclecars on the road to-day than four-wheeled, to say nothing of the host of sidecars. Have more serious mishaps from burst tyres occurred to the former than to the latter? If so, when and where?

As regards reliability, the English Six Days' Trials, which one hoped might be decisive, left the three-wheeler with an indecisive victory. One G.W.K. (four-wheeler) out of two entered gained full marks and gold medal. The one Morgan (three-wheeler) entered did the same, and beat the G.W.K. on Porlock. One A.C. (three-wheeler) obtained a bronze medal. All the other cyclecars failed. It might perhaps be taken into account that the only successful four-wheeler cost nearly half as much again as the successful three-wheelers.

Let us by all means "cut the cackle" of theorising, and come to the practical test of up-to-date experience. Would the principal makers of cyclecars of both types submit to some severe comparative test, and would the A.C.U. or the R.A.C. carry it out *pro bono publico*?

W. COUPLAND.

#### Amateur Police Traps.

Sir,—I read with mingled surprise and regret the paragraph under the above heading, which appeared in your issue of the 26th ult. Surprise that a well-informed journal like *The Motor Cycle* should have given publicity to such a ridiculous rumour, and regret at the underlying hostility to the C.T.C. which can be read into the last sentence of the paragraph.

Permit me, sir, to state most emphatically that the council of the Cyclists' Touring Club knows nothing of the independent amateur detective agency referred to by *The Autocar*, and if the proposed enterprise on the part of a few individual members of the C.T.C. in a certain district is ever brought officially to the notice of my council I am well assured it will not meet with either their sympathy or their approval.

The Cyclists' Touring Club aspires—and with conspicuous success I venture to assert—to cater fully for motor cyclists. It is using all the resources at its command, its organisation, its experience, and its funds to attract and keep this section of the wheeling public. This being so, the suggestion that it contemplates a war on motor cyclists is unthinkable. I trust that, in common fairness to the C.T.C., you will find space for this letter in your next issue.

W. S. BURKE, Secretary C.T.C.

#### SUMMARY OF CORRESPONDENCE.

"O.P." writes: "It may interest your readers to know that I successfully drove my 4½ h.p. Regal-Precision right to the summit of the Great Orme, Llandudno, above the hotel, with sidecar and passenger last month, having previously taken a passenger on the carrier. The machine was fitted with a Sturmey-Archer three-speed."

A letter signed "Spectator" complaining of the delay, timing, and other matters in connection with Torbay and District M.C.C. hill-climb is withheld. Communications such as these should appear over the writer's signature.

Sheffield and Hallamshire M.C.C. hill-climb at Cordwell Hill, Derbyshire. A group of competitors and friends at the foot of the hill.

# GYMKHANA AT THE STADIUM.

High Horse Powers and Insufficient Banking cause Two Accidents.

N.W. London M.C.C. race meeting and gymkhana at the Stadium. "Take the pig to market" race. This and some other events were run off on the grass.

THE North West London M.C.C. held their annual gymkhana on Saturday last. Unfortunately, there were two accidents owing to speeds being attained on machines which were too powerful for the banking of the track. A. J. Dreydel had a fall and a bad shaking at practice, and in the multi-cylinder race D. Grey Blakey lost control; he was thrown quite eighteen yards, and sustained a compound fracture of the arm, in addition to sundry cuts and bruises. In the open events only lightweights were allowed, but the members might use any machines they pleased. Later enquiries showed that Blakey was progressing favourably. Results:

## "Take the Pig to Market" Race.

- I. Passenger Machines Handicap (three lap).—1, S. Hiltouse (3½ Zenith sc.); 2, W. C. Knight (8 Zenith sc.). Time 2m. 13s.
- II. Lightweight Scratch Race (two lap).—1, W. Cooper (Douglas); 2, P. H. Goddard (Douglas). Time 59½s.
- III. Scratch Race (three lap—for singles).—1, E. F. Laurence (Rudge); 2, E. Gwynne (Rudge). Time 1m. 22s.
- IV. Taking the Pig to Market (for motor cyclists and foot passengers, holding a seven foot string).—1, O. Hill (Douglas).
- VA. Lightweight Handicap (three lap).—1, H. J. Pooley (2½ Premier); 2, H. E. Taylor (2 Humber). Time 1m. 56s.

Vb. Douglas Handicap (three lap).—1, P. H. Goddard (12s.); 2, W. Cooper (scr.). Time 1m. 37½s.

VI. Multi-cylinder Scratch Race (three lap).—1, R. L. Printz (5 Bat); 2, A. Brunton (5 Bat). Time 1m. 15½s.

VII. Air Balloons.—1, G. H. Hollis; 2, A. Brunton.

VIII. Open Lightweight Scratch Race (three lap).—1, F. G. Barker (2½ Zenith); 2, R. Holloway (2½ Premier). Time 1m. 23s.

IX. Single-cylinder Handicap (four lap).—1, E. Gwynne (Rudge); 2, E. F. Laurence (Rudge). Time 1m. 55s.

## Attempt on Mile Record.

Attempt on the mile record for engines not exceeding 330 c.c., which stood at 68½s.—H. Martin (1½ Martin, 270 c.c.), 64s.; F. E. Barker (2½ Zenith, 294 c.c.), 71½s.

X. Musical Chairs (lady passengers).—H. E. Taylor and Miss Taylor; (solo machine) R. L. Printz.

XI. Open Lightweight Handicap (four lap).—1, F. E. Barker (2½ Zenith), 5s.; 2, H. Martin (1½ Martin), scr. Time 1m. 46½s.

XVI. Relay Race.—Pink Team: H. Berlandina (Douglas), C. Rose (Rudge), A. Brunton (5 Bat), and E. G. Westcott (3½ Zenith sc.).

XVII. Solo Machine Handicap (nine lap).—1, P. H. Goddard (Douglas); 2, W. Cooper (Douglas); 3, E. L. Buchanan (3½ Premier).

XIII. Turks' Heads.—1, H. J. Pooley; 2, G. H. Hollis.

Start of the three-lap open scratch race. The winner, F. E. Barker (2½ Zenith), is seen on the left of the picture.

# Motor Cycle Racing at Brooklands.

## The Last B.A.R.C. Meeting of the Year.

**T**HE last meeting of the year of the B.A.R.C. on Saturday last was a distinct success. The weather was glorious, and the attendance was very good. Unfortunately, the wind was too high for flying. The one motor cycle race had attracted twenty-six entrants, of whom twenty-three took the line at the fork. At the start all got away without difficulty. McNab's Douglas gathered speed with marvellous rapidity, but Bailey's machine did not on this occasion appear to accelerate quite so quickly. The

Final meeting of the 1912 season at Brooklands. Competitors lined up for the twelfth short motor cycle handicap.

two inseparables, Jacobs and Le Grand, both on identical machines (2½ h.p. Singers) had exactly the same start, and went off with but a few yards between them, but at the finish several places divided them. The race appeared in the programme as the Twelfth Short Motor Cycle Handicap. The machines had to pass the fork once and then enter the straight. The prizes were as follows: The entrant of the winner £10 or cup at option, the entrant of the second £5 or cup at option, the entrant of the third £3 or cup at option. The order past the fork at the end of the first lap was as follows: Square, Jacobs, Le Grand, Cocker, Bailey, Pressland, Walker, Hall, Manners-Smith, Hill, McNab, Elce, Stanley, Garrett, Roberts, Lavender, Axford, Remington, and Keller. Remington (Matchless) gradually forged ahead, and came in first with ease. Owing, however, to the failure of

his front brake he went straight up the banking and over the top. Great excitement prevailed for a few seconds, after which, much to everyone's relief, Remington stood on the bank waving his arms reassuringly. Immediately after his disappearance the nearest policeman rapidly scaled the bank perceptibly, slowing up as the gradient steepened. Panting, he changed to first, or, in other words, dropped on to all fours, being so busy in securing a foothold that he did not see Remington, who had had such a lucky escape, convulsed with merriment at his well-intentioned efforts. Report also has it that another man climbed the bank hat in hand expecting to find a corpse. The fortunate rider escaped with a shaking and a few scratches from the brambles into which he fell, while his machine was not much damaged (both wheels buckled) considering the severe nature of the accident.

### Brake out of order Causes Disqualification.

Major Lloyd reported the incident to the stewards, Col. H. C. L. Holden, F.R.S., R.A., and Mr. J. W. Orde, who took the view that Remington should have seen that his brakes were in order, and disqualified him for not stopping within the prescribed limit. This decision let up L. Hill (¾ Rudge) to first place, W. H. Elce, on a similar mount, being second. His speed was 73½ m.p.h. The result was as follows:

Rider and machine.	Bore and stroke.	c.c.	H'cap.	
			m. s.	
1. L. Hill (1 cyl. Rudge) ...	85×88	499	0 42	
2. W. H. Elce (1 Rudge) ...	85×88	499	0 42	
3. S. L. Bailey (2 Douglas) ...	61×60	350	1 4	
H. H. Square (1 Robin-Minerva)	69×69	258	3 0	
W. Jacobs (1 Singer) ...	69×80	294	1 56	
J. A. Manners-Smith (1 Triumph) ...	85×88	499	1 4	
S. Hall (1 Rudge) ...	85×88	499	1 14	
C. Pressland (1 Rudge) ...	85×88	499	1 24	
S. F. Garrett (1 Green-Precision)	85×88	499	0 50	
F. A. McNab (2 Douglas) ...	61×60	350	1 14	
J. P. Le Grand (1 Singer) ...	69×80	294	1 56	
S. R. Axford (2 Martin-Jap) ...	76×55	499	0 42	
G. Roberts (1 Rudge) ...	85×88	499	1 4	
A. Symes (1 Triumph) ...	85×88	499	1 14	
A. G. Walker (1 Rudge) ...	85×88	499	1 4	

The winner's speed was 65½ m.p.h. Thacker (Martin-Jap) retired owing to a broken belt.

Motor cyclists who rendered signal service on Covenant Day at Belfast. Ulster motor cyclist despatch riders and signalling corps starting out with heliographs and flags to flash messages from outlying districts to Belfast.

# Paris-Tours Reliability Trial.

The start of the Paris-Tours Reliability Trial last Sunday, in which over fifty competitors, including several British riders, took part.

The above event, organised by the Touring Club of France in conjunction with the Veloce Club of Tours, and under the regulations of the Automobile Club of France, took place on Sunday last. The following British competitors and machines took part: Pollack (2½ Singer), W. D. South (3½ Rudge), A. J. Dixon (3½ Singer), Rex Mundy (3½ Rudge), and C. L. Scott (3½ Rudge). Devay, the winner of the Grand Prix de la Sarthe, rode his 3½ Triumph. Altogether fifty-three entries were received in four classes. Vernon Taylor who had entered was, owing to his recent suspension, replaced by C. L. Scott. Unfortunately, the winners of the various classes cannot be announced, as the flexibility test, which was to decide the winners, could not be held owing to darkness falling before the close of the event. The flexibility test will take place in the neighbourhood of Paris at a later date, when the prize winners will be officially announced. The following lost no marks:

## CLASS I.

Lacroix (Peugeot) | Kamermant (Lurquin - Cou-  
Tatin (X—) | dert)

## CLASS II.

Poulain (N.S.U.) | Pollack (Singer)  
Gompertz (New Hudson) | Vuillemin (Clément)  
Guyot-Desvarennes (N.S.U.) | Golaz (Gladiator)  
Fenton (Clément) | Finat (Peugeot)  
Sweerts (Terrot) | Robertson (Motosacoche)  
Pernette (X—) | Honorez (N.S.U.)  
Barberet (Motosacoche) | Paul (N.S.U.)  
Peau (Peugeot) | Gabriel (Clément)  
Brunet (Griffon) | Colas (Peugeot)

Desitter (6 h.p. Twin N.S.U. and sidecar), a successful competitor in the Paris-Tours Reliability Trial.

## CLASS III.

Closs (N.S.U.) | Mundy (Rudge)  
Burghard (Rudge - Whit- | C. L. Scott (Rudge)  
worth) | Dubost (René Gillet)  
Devay (Triumph) | Rousseau (New Hudson)  
W. D. South (Rudge) | Brubach (Peugeot)  
Touchet (Wanderer)

## SIDECARS.

Desitter (N.S.U.) | Lightfoot (N.S.U.)  
Honorat (Indian)

Results of the speed trial on the Velodrome:

	secs.		secs.
1. Golaz (Gladiator) ...	44	6. Devay (Triumph) ...	49
2. Pernette (X—) ...	4	7. Closs (N.S.U.) ...	50
3. Vuillemin (Clément) ...	47	8. South (Rudge) ...	50
4. Paul (N.S.U.) ...	48	9. Fenton (Clément) ...	55
5. Scott (Rudge) ...	49	10. Brunet (Griffon) ...	54

The race for the Grand Prix resulted as follows:

First Round.—1, Pernette; 2, Bruneng; 3, Hervé.

Second Round.—1, Pernette; 2, Bruneng; 3, Hervé.

The last-named was disqualified for cutting in on Bruneng.

A rear view of some of the competitors reproduced to show the very legible numbers they carried on their backs.

## DUTCH PRIVATE OWNERS' RE-RUN TRIAL.

Lt. H. Daalmeyer (6 h.p. Cyclonette), winner of the P. and M. cup.

The start. The winner is on the extreme right of the picture.

It will be remembered that on the occasion of the English-Dutch reliability trial five members of the Dutch M.C.C. tied for the P. & M. Cup, offered for the best performance by a Dutch private owner. The trial was re-run last week over the same course and under the same conditions. Three motor cyclists rode with each competitor to ensure that he made a non-stop run, and club officials occupied the spare seats of the passenger machines. Four riders experienced no mechanical trouble whatever, the fifth, H. Dieters, on a Phanamobile, with A. Citroen, the hon. sec., as checker, ran into the canal between Apeldoorn and De Steeg. The occupants clung to the machine and ultimately managed to scramble out. The result was: Lieut. H. Daalmeyer (6 h.p. Cyclonette), n.s., error in time 0; G. Th. Arends (2 h.p. Vulkan), n.s., 1; J. H. Nieuwenhuys (2½ Douglas), n.s., 1; P. N. Jelsma (2½ Eysink), n.s., 2.

## A STEEL-TREADED TYRE.

Thanks to the courtesy of Mr. A. W. Torkington, of Torkington Tyres, Ltd., 76, York Street, Westminster, S.W., we are enabled to give details and illustrations of the Stelastic motor cycle tyre, which behaved so well in the Six Days' Trials.

As regards its construction, the carcass of the tyre, beyond being of the very best material, presents no special features, as it is no departure from standard practice, the whole novelty

the rubber and steel do not part. A layer of rubber is inserted between the armoured tread and the fabric, so that the springs cannot penetrate. As a non-skid, the cover is effective on wood and asphalt, but in its present form, owing to its having no projection, it is not quite so effective in slimy mud as a studded tyre. All those who have used the cover have told us that cuts in the tread are impossible; punctures are almost entirely prevented, and the only record of a puncture we have heard of is from a thin nail, which was apparently struck at the correct angle and entered between the layers.

Mr. Torkington has gone the right way to work, and has not put the Stelastic covers on the market without first of all putting them to some private and public tests, not only on high powered cars, but on motor cycles from 3½ to 7 h.p. We hope shortly to test the cover on one of our own machines, and shall report upon its behaviour.

Valve side of the 1913 2½ h.p. three-speed New Hudson power unit. The magneto is chain-driven, and the spring footboard will be noted.

Sectional view of the Stelastic tyre. The tread is composed of coil springs with rubber forced between the coils by hydraulic pressure.

being in the tread. The accompanying sketch shows of what this is composed. Coils or springs of hardened steel piano wire are woven into the fabric, and under hydraulic pressure of 70 lbs. to the square inch pure rubber is forced into the former. Each piece then becomes practically a sheet of rubber.

## Springs add to the comfort.

This is guillotined off into strips, which are placed upright side by side and form the tread. Since the steel is springy, the resiliency is not affected, as when the rubber is compressed by the weight of the motor cycle on the road the springs compress in harmony, while

## HILL-CLIMBING IN WESTMORLAND: Longsleddle to Kentmere Pass.

Mr. Nelson, of the Westmorland M.C.C., recently challenged any fellow-members to climb the above ascent, and of course the challenge was taken up by a number. It was climbed for the first time in history about a fortnight ago by W. Westwood on a three-speed (Sturmey-Archer) Triumph, but one day this week quite a large party turned out to scale it. Zeniths, Ridges, Indians, Bats, Matchless, Braithwaites, Premiers, Scotts, B.S.A.'s, and Enfields, etc., were represented. A start was made from a bridge on the main road, a lane then turns sharp to the left into a farmyard, and then to the right and left again. The surface is grass-grown most of the way, enlivened here and there by small watercourses across the track. The gradient for the first 150 yards is about 1 in 5, then follows about 200 yards of fairly easy climbing, after which the fun commences. The gradient gradually reaches 1 in  $3\frac{1}{2}$ , and of course the usual corkscrew piece is included.

The determination of the riders in attacking the climb was very creditable, some trying six or eight times. The following conquered the hill:

J. Braithwaite ( $3\frac{1}{2}$  h.p. Braithwaite),  $6\frac{1}{2}$  to 1 fixed gear.  
G. W. Braithwaite ( $3\frac{1}{2}$  h.p. Rudge), Bowden two-speed, bottom ratio 10 to 1.

R. Bowness ( $3\frac{1}{2}$  h.p. Matchless),  $5\frac{7}{8}$  to 1 fixed gear.  
E. Jefferys (5-6 h.p. twin Bat-Jap),  $6\frac{1}{2}$  to 1 fixed gear.  
W. Westwood ( $3\frac{1}{2}$  h.p. Triumph), Sturmey-Archer three-speed gear.

Several failed through various causes. Sidecars need not attempt the hill, as they could not be driven round the

corners. The hill is practically unclimbable in wet weather, as the surface is treacherous when wet and causes side slipping. The foot of the hill is about ten miles from Kendal, and is reached by turning off the Shap to Carlisle road  $4\frac{1}{2}$  to 5 miles out of Kendal.

Hill climbing in Westmorland. R. Bowness ( $3\frac{1}{2}$  h.p. Matchless-Jap), who at the twelfth attempt got up Longsleddle to Kentmere Pass with a fixed gear of  $5\frac{7}{8}$  to 1. This was the highest fixed ratio used by any of the party.

## LATE CLUB RESULTS.

Side view of the Kendal cyclecar with hood and wind screen. This cyclecar is made by Kentall's Motors, Sparkhill, Birmingham, and has an 8 h.p. twin-cylinder engine, 80 x 94 mm., ash frame, plate clutch, two speeds forward, and 26 x 2 1/2 in. tyres. The final drive to rear wheels is by belts which are well protected.

## Liverpool A.C.C. Trial Results.

The results of the trial described on page 1130 reached us on going to press. They are as follows:

WINNER OF RELIANCE CUP AND CLUB GOLD MEDAL.—E. F. Baxter (6 Rex).

BEST PERFORMANCE BY A LADY.—Miss M. Hind (6 Rex).

BEST PERFORMANCE BY LOCAL AMATEUR.—E. F. Baxter

BEST PERFORMANCE ON LIGHTWEIGHT.—W. Heaton (23 A.J.S.)

BEST PERFORMANCE BY AMATEUR SIDECARIST.—J. R. Haswell ( $3\frac{1}{2}$  Triumph sc.)

CLUB MEMBERS AWARDS.—Trade: A. J. Jenkins (23 Douglas). Amateurs: L. Mogridge ( $3\frac{1}{2}$  Mead-Precision).

Among those who gained medals are:

E. A. Eastwood (23 Douglas), S. W. Phillpott (23 Humber), H. New ( $3\frac{1}{2}$  Triumph), V. E. Horseman ( $3\frac{1}{2}$  Singer), S. Crawley ( $3\frac{1}{2}$  Triumph), P. Shaw ( $3\frac{1}{2}$  P. and M.), Mrs. Baxter ( $3\frac{1}{2}$  Rex), H. J. Marston (8 Dot), F. Smith (5-6 Clyno sc.), A. Marston (8 Bat), T. Smyth (5 A.J.S.), M. Rimmer (Zenith), and F. C. Jones ( $3\frac{1}{2}$  Zenith).

## Manchester Amateur M.C.C.

Amended result of hill-climb held at Axe Edge on the 22nd ult.: Class II.—1, P. W. English (7 Indian); 2, H. Marsden (8 Matchless), 1m. 4s.

## Cumberland County M.C.C.

The last event of the season, a speed-judging competition, was held on the 28th ult. The start was from Fendley's garage, Carlisle to Milburn's garage, Penrith, a distance of eighteen miles. The result was as follows: 1, Hilton Robinson ( $3\frac{1}{2}$  B.S.A.); 2, William Beck ( $3\frac{1}{2}$  T.T. Triumph); 2, Stanley ( $3\frac{1}{2}$  P. and M.)

## Aberdeen and District M.C.C.

On Saturday last a flexibility trial was held on the Slug Road. The weather was dry and cold, and there was a large number of spectators. Results: 1, T. Smith ( $3\frac{1}{2}$  B.S.A.), winner of rose bowl presented by the vice-president Mr. J. Spencer; 2, A. Stewart ( $3\frac{1}{2}$  Rudge); 3, W. Simpson ( $3\frac{1}{2}$  Rudge); 4, G. Cumming (2 1/2 Levis). The Levis arrived with a sidecar attached and a 12 stone passenger.

## Burnley A.C.

A reliability trial will be held on the 6th inst. Route, *via* Whalley, Trough of Bowland, Lancaster, Morecambe (stop of about three hours), Garstang, Preston, Mellor, and Burnley. The start will be from the Old Red Lion Hotel, Burnley, at 9 a.m.

Manchester M.C. gymkhana. The cigarette race.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

Oct.	3rd	...	6.33 p.m.
"	5th	...	6.28 "
"	7th	...	6.24 "
"	9th	...	6.20 "

## Stolen Machines.

A 1912 2½ h.p. two-speed F.N., No. 32892, has been stolen from 465, Battersea Park Road, S.W. Information concerning it should be sent to the owner, S. C. Buxton.

## To Birmingham and District Riders.

The A.A. has circularised its Midland members, pointing out that the Chief Constable of Birmingham has approached the Association, to see what can be done to prevent certain motor cyclists riding at excessive speeds, and without proper consideration for others. The Association appeals to the good feeling of all Birmingham motor cyclists to assist in preventing further complaints being received.

## The Silencer Question.

The silencer which is the outcome of the preliminary A.C.U. trials has now been made and fitted to a Rudge motor bicycle, which has been tested before Colonel Holden, who is satisfied that it gives the correct degree of silence. Invitations will be sent out this week by the A.C.U. inviting manufacturers to enter for the trial, which it is hoped will be held this autumn. We understand that the Local Government Board is shortly about to issue regulations affecting the use of cut-outs on motor cycles.

## New Irish End-to-end Record.

J. Stewart did an excellent performance on the 25th ult., on his Douglas, as he reduced the previous record made by C. E. Murphy by sixteen minutes, and the lightweight record held by himself by two hours and eighteen minutes. His time for the whole distance was twelve hours and fifty minutes, giving an average for the journey of thirty-one miles per hour. Stewart started at 5.30 a.m. from Mizen Head; the morning was cold and the roads loose. Better roads were met with near Cork, but much delay was caused by herds of cattle. Cork (81 miles) was reached at 8.23. Breakfast was taken at Cashel, after which the journey was resumed at 10.30, when good progress was made, till a horseshoe nail caused a puncture. This was too hastily mended, and a nip soon followed. The road through Dublin was taken in preference to the shorter road through the bog. Near Dundalk, Stewart ran short of petrol, but by tilting the tank and free wheeling down the hills managed to reach a supply. The journey was finished at 6.20 p.m., and the time occupied was twelve hours fifty minutes.

## C. and M. T. Benevolent Fund Dinner.

The Seventh Annual Banquet of the Cycle and Motor Trades Benevolent Fund will be held at the Connaught Rooms, Great Queen Street, on Thursday, October 24th, at 7 p.m. Mr. Albert Brown will be in the chair. This Society is one which is deserving of the greatest support.

## A Record Signpost?

Just off the Preston-Lancaster Road there is a sign post near Garstang with three arms, and the total mileage thereon totals up to 2,493½. It would be interesting to know whether this constitutes a record for one post. It certainly would for three arms. Below are the distances:

North: Lancaster 12, Kendal 33, Carlisle 77, Edinburgh 171, Glasgow 172, Thurso 454.

South: Liverpool 41, Manchester 42, Chester 59, Holyhead 144, London 224, Penzance 387.

East: Chipping 9½, Slaidburn 21, Clitheroe 19, Skipton 36, York 80, Hull 121, Lincoln 131, Lowestoft 260.

## The Motor Cycle in War.

F. Whitaker, of Orpington, who participated in the army manoeuvres on the Blue side, writes that he had to carry a despatch from Wimpole Park to Wendy. The message was from Major Duncan to the effect that the umpire, Major Bridger, was to be at a certain spot at a given time, and that he was unable to go on horse back. The motor cyclist despatch carrier therefore took the umpire on his carrier to the rendezvous and had several minutes to spare.

A prominent journalist writes that in his opinion motor cyclists will supersede cavalry. This is after a fortnight with the combined armies and from an observant writer.

## SPECIAL FEATURES.

### MOTOR CYCLE TAXATION.

### UNOFFICIAL 1,000 MILES TRIAL.

### PARIS-TOURS TRIAL.

## The Institution of Automobile Engineers.

A meeting of the Birmingham Centre of the Institution of Automobile Engineers will be held on Thursday, 17th October, in the theatre of the University Buildings, Edmund Street, Birmingham, when Mr. Douglas Leechman (member) will read a paper entitled "The Influence of Low Production Cost on Quality." The chair will be taken at 8 p.m. by the president of the institution, Mr. T. B. Browne, and an invitation is extended to all those who are interested in the above subject.

## Motor Cycle Taxation.

The A.C.U. is forming a strong committee to deal with the taxation question, the duty of which will be to show up the injustice of the present proposals and suggest alternative ones. Questions will be asked in the House, and, if necessary, the Chancellor of the Exchequer will be asked to receive a deputation. This committee will be under the chairmanship of Mr. Otto Thomas, while Mr. T. W. Loughborough will act as secretary. The three members representing the A.C.U. will be Major Lindsay Lloyd, Major D. F. Nicholl, D.S.O., R.A., and Mr. Archibald Sharp. The following bodies will also be invited to send three representatives each: The Scottish Motor Cyclists' Union, the M.C.U. of Ireland, the Motor Cycle Manufacturers' Union, the Commercial Motor Users' Association, and the A.A. and M.U.

N.W. LONDON M.C.C. GYMKHANA.

The start of the sidecar race at the Stadium on Saturday last, won by S. Hilhouse (3½ h.p. Triumph), who is seen in the centre of the photograph.

J. Farnsworth (3½ h.p. three-speed Rover), the contributor of the article on military motor cycling in this issue.

### Fresh Registration Marks.

The new London County Council registration marks are L.H. This is in addition to A, LC, LN, LB, LD, LA, LE, and LF.

### The Inventor of the Low Engine.

Dr. A. M. Low, D.Sc., the inventor of the Low forced induction engine and the Low detonating plug, has recently been made a doctor of science.

### A Denial.

The Triumph Cycle Co., Ltd., wish us to deny a rumour which has gained ground in Scotland that it is their intention to close their depot in Glasgow. The firm say that they have never even contemplated such a course.

### Military Motor Cyclists.

It is interesting reading to hear that officers who commanded the combined armies in the recent manoeuvres have expressed a wish that next year's motor cyclist despatch riders should be "a proper unit of the Army" instead of being collected by the motoring organisations. We echo the desire.

### Definition of Cyclecars.

A few manufacturers of cyclecars have queried us with regard to the admission of cyclecars at the Olympia Motor Cycle Show. The Manufacturers' Union has decided that the A.C.U. definition of a cyclecar must be followed, viz., chassis weight with tyres 6 cwt., cylinder capacity not exceeding 1,100 c.c. The definition of a chassis according to *The Autocar*, which is an authority on such matters, is: Chassis includes tyres, all tanks (empty), bonnet, mudguard irons, running board irons and dash.

### The Worst Roads in England.

*The Sanitary Record*, in a paragraph headed "The Worst Roads in England," says much that is to the point about the Devonshire highways. *The Birmingham Daily Mail* has quoted the paragraph under the same heading, but says nothing about the Warwickshire roads. If the Devonshire roads are worse than the Warwickshire ones, they are indeed bad. After the splendid surfaced highways of Herefordshire and some parts of Worcestershire, it is purgatory to bump over the Warwickshire apologies for top dressing.

### Italian Road Race.

The Targa Florio car course in Italy was used for an important motor cycle race recently. England, France, and Italy were represented, the winner being an Italian named Revelli, who rode a 3½ h.p. Triumph. The distance was 240 kilometres.

### Interest in the Cyclecar.

Humber agents assembled in force at the Coventry works of the company last week, and of all the new models open to their inspection, none attracted more genuine interest than the new cyclecar, to be known, by the way, as the Humberette. It is common knowledge that the Humber Co. have been experimenting with a twin-cylinder air-cooled three-speed shaft-driven cyclecar for eighteen months, in fact ever since the original two-speed model was dealt with in *The Motor Cycle* in the spring of 1911. They are now able to offer a vehicle of proved reliability which has undergone a 6,000 miles test on the road. Last Thursday, the engine of the cyclecar was

FUTURE EVENTS	
Oct. 5.	Manchester M.C. Open Hill-climb.
" 5.	Herts County A.C. Open 100 miles Reliability Trial.
" 5.	Exeter and District M.C.C. Open Hill-climb.
" 12.	B.M.C.R.C. Race Meeting.
" 12.	Liverpool A.C.C. Open Hill-climb.
" 26.	A.C.U. Autumn Open One day Trial.
Nov. 2.	N. Middlesex M.C.C. Open Winter Reliability Trial.

started at 11 a.m., and so great was the demand for trial runs on the car that it was kept going until after dark. Everyone is enthusiastic in praise of the Humberette.

### Ladies and the Pastime.

Ladies tour on motor cycles now as easily as men. Mrs. S. Robinson, of Northampton, has just completed a long tour to Scotland and back on a lightweight machine fitted with a 2½ h.p. J.A.P. engine and three-speed gear. Mrs. Robinson, who has taken to motor cycling with great enthusiasm, considers the pastime a most fascinating one, and hopes that other ladies in Northampton will follow her example.

### A New Use for Sidecar Bodies.

In the current issue of *The Autocar* appears a novel suggestion entitled "A New Use for the Sidecar." The recommendation is that, in the case of a two-seated car with narrow wind cutting tandem body, if the owner wishes at any time to take extra passengers, instead of seating them on the stepboard as is so often done, a detachable sidecar body could be fitted on the running boards in such a way that an extra passenger could be carried on each side in a wicker or cane sidecar bodies, pannier fashion. Of course the body or bodies would be made easily detachable, and so fitted that they did not overhang the overall width of the wings.

### Open Championship at Brooklands Meeting.

In addition to the Auto Cycle Union Championship Races to be held at the B.M.C.R.C. open meeting on the 12th, and announced in our last issue, the following events will be run off in the morning: The Fourth 1912 Time Trials, One Hour Cyclecar Race, and One Hour Sidecar Race. Entries close on Saturday next, the 5th inst., and should be sent to Mr. T. W. Loughborough, hon. sec., Dell View, Shooters Hill, Kent.

### A Dangerous Practice.

The old trick of placing a string across the road on a level with the head of the rider of a motor cycle or pedal cycle has cropped up again in Bishop Auckland. It would be well if the police were to take very drastic action in cases of this kind, as serious injury can be caused to a rider's eyes, not to speak of knocking him off his machine, blinding him, or cutting his throat with the taut string. In the particular instance under discussion, the string was supposed to have been placed in position by some boys about twelve years of age. The birch is the only cure for this kind of thing.

### Gaillon Hill-climb.

This French event is a combined sporting and social function, and practically amounts to the hill-climbing championship of France. It will take place on Sunday, the 6th inst., and entries should be sent to *L'Auto*, 10, Rue du Faubourg, Montmartre, Paris. For motor cycles, etc., the cost of entry is 10 frs., entries closing to-day (Thursday). Gaillon is most accessible from Dieppe, the distance being only about sixty-one miles, so that one can cross by the morning boat and reach Gaillon, or the immediate vicinity, the same evening with only about half an hour's night riding. Not only motor cycles, but big cars will take part, and there is always a possibility that the record for cars of 158 kilometres (ninety-six miles) an hour might be beaten. The route is a most enjoyable one, and we advise the journey to be made by road. Week-end tickets from Newhaven to Dieppe cost 18s.

The change speed gear fitted to Harry Reed's Dot-Jap in the Liverpool A.C.C. Trial last Saturday.

## The Liverpool A.C.C. One Day Trial.

THE Liverpool A.C.C. laid itself out to give its competitors a sporting course, and if a series of gruesome corners, steep hills, and vile surfaces are considered to attain this end, it succeeded admirably. Seven lady riders appeared at the start, but we have never seen less of a lady's trial. On the other hand, the trial was a fine test for machines, and anything that could make a non-stop over the course chosen may be considered capable of going anywhere. We heard several complaints of the course being very badly marked, but though we had a little difficulty in places, the officials had obviously worked hard, for, to begin with, there was a confetti trail, and then came arrows and pain marks, but there were so many corners on the course that it was almost impossible to mark them all. The local police did good work in directing competitors and deserve great praise.

The start took place from Hamilton Square, Birkenhead, and, in consequence, the Birkenhead hotels were full. We were lucky in meeting S. Crawley on our arrival in Liverpool the night before, who warned us of the state of affairs and advised staying in Liverpool.

Among the interesting machines, we noticed H. Reed's Dot which was fitted with a new three-speed counter-shaft gear and chain-cum-belt drive; the gear will be fitted in 1913 with either a similar drive or chain drive throughout. Haswell's three-speed Triumph was fitted with a long change speed lever working in a quadrant fixed to the tank, and a 3½ Bradbury and sc. had a N.S.U. two-speed on the engine-shaft and a Sturmey-Archer three-speed hub, giving in all five changes of gear; this machine also had a useful belt guard fitted. The 6 h.p. Clyde-Jap looked a useful machine, and we were glad to see it entered in a big trial.

At 8.30 the first competitors were got away, and one of them ran over a dog almost immediately, fortunately without serious results.

A few miles from the start S. Child (2½ h.p. New Hudson) shed his front brake shoes with a rattle, but no further damage was done, and he was able to continue.

Special arrangements had been made for competitors at Queensferry Bridge, but as we were without an official number we had to pay a 6d. toll.

The run to Llangollen was comparatively uninteresting in view of what was to come, and little of moment occurred. Some competitors went astray at Hawarden, and Miss Baxter, who was pluckily riding a 2½ h.p. Douglas which had only been delivered to her the night before, had trouble with the low gear refusing to engage. About three miles from Llangollen came the first warning of trouble in the form of a long steep ascent which joins the Corwen Road at the top. This hill proved a stumbling block to many; in fact, none of the early arrivals made clean ascents. Probably many failed on account of the strong cross wind affecting their carburettors; certainly Fenn (2½ h.p. Humber), who failed at the first attempt, came up well afterwards, protecting the

Bird's eye view of the old road from Llangollen to Ruthin, known as the Horseshoe Falls road. The rider in the foreground is Mrs. Hardee (P. & M.), who made a clean ascent.

air-intake with his hand. No speed could be attained on account of the awful cross gullies. After this hill we were taken over a narrow road towards Bryn Eglwyls. This road led through slate quarries and bristled with hairpin bends, the surface being narrow and bad. As we descended one little piece of about 1 in 6 over lumps of slate and boulders with a narrow gate to follow we wondered what would become of the side-car outfits, and subsequently heard that one at least had overturned. However, on reaching the main road again we had a good run into Bala. (Lunch stop.)

After lunch the mountain road to Festiniog was traversed. The scenery was grand, and the surface for a mountain road good. In Festiniog we took a sharp right-handed hairpin corner to Blaenau Festiniog, and thence up the long hill out of the town; the surface of this was good, and it did not trouble the majority of the competitors. Then followed more fine scenery to Llanrwst, and afterwards a long steady pull up on the Abergele Road. After this we were taken down lanes to Llausanman, and until we reached the main Denbigh Road competitors were too much occupied in trying to retain their seats to worry about scenery.

This section of road was all up and down heavy gradients, the lanes being very narrow, and the surface simply appalling. We cannot think that any tourist would choose this sort of road for pleasure, and it was with a sigh of relief that we regained the main road, and so into Denbigh. Here a twenty minutes' stop was allowed for tea and refreshments. After a short stop and a chat with a few competitors we continued on

Six out of the seven lady riders in the Liverpool A.C.C. trial. From left to right they are Mrs. Hardee (3½ P. & M.), Miss Pickles (3½ Rudge), Miss May Walker (2½ Hobart), Mrs. Baxter (3½ Rex), Miss Muriel Hind (6 Rex), and Miss Baxter (2½ Douglas).

**The Liverpool A.C.C. One Day Trial.**

the third and last section, on parts of which it was quite hard to find the way. We reached Mostyn by devious routes, and caught a fleeting glimpse of the sea. Here we descended a bad hill on to the coast road along which the route led until it turned up the hill to Holywell. Then came Penyball Hill, the *pièce de résistance* of the trial. There is a long steady pull up hill, then two right-angled turns in the narrow village streets, and then the real hill. Failures were extremely numerous.

At the top of this hill the road disappears for a short distance, and one takes the choice of a rocky path or grass (personally we preferred the grass). The route then led back to Holywell, and thence to the finish at Queensferry. Results will be found on a previous page.

We cannot refrain from mentioning a little incident which occurred early in the trial. A certain lady competitor who had trouble with her machine prevailed on a kind-hearted marshal to let her have his machine, on which to ride to the nearest railway station, while he mounted her damaged machine and was towed over ten miles of dangerous mountain roads. To prove her gratitude for this kindness, instead of stopping at the station the lady rode on a further twenty miles to the lunch-stop at Bala, and left her unfortunate benefactor to cool his heels for nearly four hours at a dismal railway station.

Our thanks are due to Mr. Carson, of the Excelsior Motor Cycle Co., who kindly suggested that we should ride a  $4\frac{1}{2}$  h.p. Excelsior fitted with the G. and H. gear and Binks carburetter. The machine ran splendidly throughout the day, and climbed all the hills with the greatest ease. We stopped on two or three of the worst for observation purposes, and each time restarted comfortably. The gear ran

silently and sweetly, and the slipping clutch renders it as flexible as any belt. The carburetter also was a great convenience, and gave plenty of power, a quick pick up, and beautifully slow running in traffic.

Restarting after lunch at Bala. N. Brown (Indian) leading off.

## CLUB NEWS.

**North Middlesex M.C.C.**

The remaining competitions arranged for this year have been cancelled.

**Manchester M.C.**

An open motor cycle hill-climbing competition will be held on the 5th inst. at 1 p.m. The hill is practically straight and safe. There will be five classes.

**Cowbridge and District M.C.**

A non-stop reliability run and speed judgment competition was recently held in connection with the above club. The course was over a distance of fifty-five miles, which included two stiff hills. Five competitors made non-stop runs and the awards were as follows: 1. F. E. P. Dunn ( $3\frac{1}{2}$  h.p. two-speed Humber); 2. B. S. Bird ( $3\frac{1}{2}$  h.p. Triumph). A hill-climb, followed by a supper (when the prizes won during the season will be distributed), will be held on the 9th inst.

The old road from Llangollen to Ruthin, A. S. Pierson (6 h.p. Rex-Jap sidecar) half way up the hill.

**Sheffield and Hallamshire M.C.C.**

On Saturday afternoon, the members held a hill-climb up an old grass grown lane near Owlbar, Derbyshire. After a tie, Flint ( $3\frac{1}{2}$  Norton) won.

**Feilding (New Zealand) M.C.C.**

A flexibility hill-climb was held on Brickfield Hill recently. Fast.—1, E. Hinds (7 Indian); 2, E. Ford ( $3\frac{1}{2}$  Triumph). Slow.—1, E. S. Pecs (2 $\frac{3}{4}$  Douglas); 2, P. S. Pecs (2 $\frac{3}{4}$  Douglas). E. S. Pecs was the winner.

**Motor Cycling Club.**

The paperchase announced for the 28th ult. will be held on Saturday next, the 5th inst.

The annual dinner and presentation of prizes will be held at the Adelaide Gallery on December 7th. Particulars will be sent out in due course.

**Welsh A. and Ae.C.**

A hill-climb was held on the 21st ult. at Llethryd Hill. Results on A.C.U. formula:

Sidecar Class.—1, A. Jackson, .287; 2, F. C. Harrison, .255; 3, D. G. Hughes, .241.

Motor Cycles (Solo).—1, Edgar Thomas .294; 2, Edgar Morgan, .254; 3, W. Trow, .240.

**Manchester M.C.**

The second gymkhana and sports for this season took place on the 28th ult., at Hoo Green, Cheshire. The weather was fine, but the cold wind was responsible for keeping many away. In the tag of war, car owners v. motor cyclists, the car owners, being much the heavier, won easily. The meeting was most successful.

**Harrogate and District M.C.C.**

On Saturday last an impromptu hill-climb was held on a fairly stiff hill of about half a mile in length. Each competitor had to ride the hill once, and afterwards to again ride up the hill as near as possible to his original time. There was some remarkably fine running, the first four competitors being within one second of their previous times. Result:

1. W. E. Grange ( $3\frac{1}{2}$  Bradbury) ... 0 $\frac{1}{2}$ s. difference.
2. W. B. Dickinson (2 $\frac{3}{4}$  Douglas) ... 0 $\frac{1}{2}$ s. difference.
3. C. A. Nettleton ( $3\frac{1}{2}$  New Hudson) 0 $\frac{3}{4}$ s. difference.
4. H. W. Fortune ( $3\frac{1}{2}$  Brown) ... 0 $\frac{3}{4}$ s. difference.

## Club News.—

## Walthamstow M.C.

The above club held a handicap speed trial over a private course, distance fourteen miles, on the 29th ult. Results: 1, A. E. Uffelman (6 Rex-Jap); 2, A. R. Abbott (3½ Bradbury); 3, F. A. Applebee (7 Indian). F. A. Applebee made the fastest time of the day.

## Aberavon, Port Talbot, and District M.C.C.

A speed trial was held on the sands at Aberavon on the 19th ult., with the following results:

	Rider and machine.		Weight. Cts. Lbs.	c.c.	Time.	Fig. of M. S. merit.
1.	G. Jones (James)	...	3 1	558	1 4½	689
2.	J. Locke (Zenith)	...	3 42½	750	1 0½	732
3.	R. M. Lewis (T.T. Premier)	...	3 7½	499	1 13½	787

## Southampton and District M.C.C.

The annual hill climb for members took place at Gravel Hill, Shedfield. The hill was in good condition, and not too steep, so that everyone had a sporting chance. The results, with figures of merit, were as follows:

Solo class.—1, J. Tuffin (3½ h.p. New Hudson), 21.2; 2, W. Winckworth (3½ h.p. Sun-Precision), 19.3; 3, H. Scott (3½ h.p. Ariel), 18.0.

Sidecar class.—1, W. Winckworth (3½ h.p. Sun-Precision), 24.8; 2, J. Tuffin (3½ h.p. New Hudson), 21.6; 3, J. Silvey (6 h.p. N.S.U.), 16.1.

## Birmingham M.C.C.

The fourth annual flexibility hill climb was held on Saturday last. There were some forty entries, and the climb was run off very promptly. Each competitor had to make two ascents of the hill in each class, one slow and the other fast, the greatest difference between the times was taken as being the "flexibility" of the machine. The results are as follows:

## CLASS I. (for variable geared machines).

		Time difference.
K. Holden (3½ B.S.A.)	...	8m. 24s.
V. Busby (3½ Humber)	...	8m. 14s.
N. C. Pickering (2½ A.J.S.)	...	5m. 40s.

Holden also made fastest time of the day.

## CLASS II. (for fixed gear machines, or variable geared machines with gears fixed).

N. Ball (3½ Triumph)	...	3m. 40s.
J. J. Woodgate (4 Singer)	...	2m. 43s.
H. J. Cox (2½ Forward)	...	2m. 20s.

## CLASS III. (for variable geared passenger machines).

K. Holden (3½ B.S.A. sc.)	...	6m. 26s.
J. J. Woodgate (4 Singer sc.)	...	4m. 35s.
Dr. B. Fawcett (8 Chater-Lea-Jap and Lowen sc.)	...	3m. 52s.

The hill was about one-third of a mile long, and had a gradient of about 1 in 8 at the steepest part.

## Essex M.C.

The annual dinner and distribution of prizes will take place on December 14th at the Great Eastern Hotel, E.C.

## Dundee and District M.C.C.

Open speed trials will be held on the sands on Monday, the 7th inst. These are the first open events of this nature held on sands in Scotland.

## Bristol B. and M.C.

The above club recently held a sporting trial through the hilly and picturesque country near Stroud, the course being from Bristol to Wotton-under-Edge, Dursley, up Uley Hill, Stroud, Nailsworth, and Chipping Sodbury. There were fourteen starters, eleven making non-stop runs. So close did the majority run to time that a special secret check was utilised to find a winner, the result being: 1, A. S. Richards (2½ A.J.S.), 2, F. C. Wasley (2½ Douglas), 3, R. H. Bishop (5 A.J.S. s.c.). The principal prizes were tyres, presented by Messrs. Wood-Milne Tyre Co., and Messrs. the Kempsall Tyre Co. After the run some thirty members and friends sat down to tea at the Grapes Hotel, Chipping Sodbury.

## M.C.U.I. (Ulster Centre).

The above centre held a series of hill-climbs on Saturday last on a hill situate midway between Dromore and Ballynahinch, County Down. The climb was exactly half a mile, and the gradient averaged about 1 in 7. There was an open and a lightweight class, and the entries totalled twenty-two. The competition was decided in heats on the "knock-out" principle, and J. Stewart (2½ h.p. Douglas) won both events. J. Hobson (3½ h.p. Singer) won the novice prize. Results:

Open Class (Final).—J. Stewart (2½ h.p. Douglas), handicap 10s., beat J. Martin (3½ h.p. Triumph), 5s.

Lightweight Class (Final).—J. Stewart (2½ h.p. Douglas), scratch, beat S. Stewart (2½ h.p. Singer), 3s.

## Mersey M.C.

An open hill-climb will take place on the 12th inst. at Pen-y-ball (Holywell). Class I., singles and twins up to 300 c.c.; Class II., singles and twins between 300 and 600 c.c.; Class III., singles and twins between 600 and 1,000 c.c.; Class IV., sidecars and cyclecars. Awards: Gold, silver, and bronze medals in each class for best performances on formula and fastest times. Formula as recommended by *The Motor Cycle*  $\frac{C \times T^2}{W}$ . A Palmer tyre (presented by Palmer Tyre, Ltd.) will be awarded to the best performance on time and to the best performance made by a novice.

N.B.—The definition of a novice is a competitor who has never won any prize in any open hill-climb.

Entries close on Tuesday, the 8th inst., at noon, at ordinary fees, and up to October 12th, at noon, at double fees. Entry forms can be obtained from Mr. S. W. Carty, hon. sec. Mersey Motor Club, 5, Red Cross Street, Liverpool.

Mr. Alec Ross (A.C.U.) despatching competitors at the start of the Sutton Coldfield A.C. petrol consumption trial.

# Bowden Two Speed Gear

## A simple countershaft Gear to fit **YOUR** Machine.

The Bowden Two-Speed Gear is simply and substantially constructed, and in it is incorporated every form of advantage associated with the countershaft type of gear. Transmission is by chain from engine shaft to gear box, and thence by belt from an 8in. pulley. Belt slip from this large pulley is negligible.

### One of many unsolicited testimonials.

Bristol, 27th August, 1912.

Dear Sirs,—I have had your gear fitted to a Triumph with Millford sidecar and have been running it all the summer. The result has been most satisfactory, and I've given it some jolly hard work to do, including a run over Dartmoor the other day through Two Bridges and on to Tavistock and Plymouth.—T.R.P.

Price (Standard Gear, Engine Sprocket unborred) £10 : 10 : 0.

May we send you a descriptive leaflet?

### EVERY MOTOR CYCLIST SHOULD READ THIS LETTER.

23, Queen Street, Horncastle.

Messrs. The British Monogram Oil Co., Ltd., Acton Vale, W.

Dear Sirs,—I used your Oil last week when I broke the World's Sidecar Record by 104 miles. I covered 1,656 miles in the six days. As you know, this is a very severe test, as machine and passengers weighed 6 cwt., but your Oil was splendid, and during the whole six days the engine never once showed any signs of getting hot, which is wonderful on a severe journey like this. There is not a doubt your Oil is perfect, and I wish you every success.—Yours truly,

(Signed) WM. J. CLARKE.

## Club News.—

## SCENES AT THE AMULREE HILL-CLIMB.

A. H. Alexander (2½ h.p. two-speed Douglas) on which he competed in the sidecar and lightweight classes.

## Bedford and District M.C.C.

The above club will hold a reliability trial on the 5th prox., starting at midnight from Bedford to York and back.

## Kingston and District M.C.C.

This club held recently a reliability trial and speed-judging test from Kingston to Oxford *via* Dashwood. Eleven members competed for the G. G. T. Butler challenge cup. The winner was T. A. Edwards (¾ Premier); 2, D. W. Morgan (¾ Triumph).

## Redditch and Stratford-on-Avon M.C.C.'s

The result of the inter-club reliability trial between the Redditch and Stratford-on-Avon M.C.C.'s was a win for Stratford by 288 points. Seven rode on each side, the top score being made by C. W. Barnard (¾ T.T. Triumph), who gained full marks.

## Cheltenham M.C.C.

The results of a recent reliability trial were: 1, H. Lewis (¾ h.p. Triumph); 2, G. Nash (¾ h.p. Triumph); 3, W. B. Gibb (2¾ h.p. Douglas). The competitors were started from the Belle Vue Hotel, and the route lay through Prestbury to Cleeve Hill, then through Sevenhampton, Synford, and Stow-in-the-Wold back to Cheltenham.

## Manchester Amateur M.C.C.

A flexibility hill-climb was held at Axe Edge on September 22nd, the course being about a mile and an eighth long, with a splendid surface. Before the actual start was made, H. Marsden (7-9 h.p. T.T. Matchless) and J. McCann (7-9 h.p. T.T. Indian) ran off a tie on the "knock-out" principle. The course being clear, the riders streaked up the hill neck and neck, H. Marsden eventually running home by a couple of wheels. Unfortunately, however, their times were not taken.

The results of the flexibility hill-climb, based upon the difference between fast and slow ascents, are as follow:

## CLASS 1.—Singles up to 550 c.c.

- |                                      |          |
|--------------------------------------|----------|
| 1. R. Birkett (T.T. Triumph) ...     | X        |
| 2. H. D. Ashworth (T.T. Triumph) ... | 0m. 50s. |
| 3. R. N. Earwacker (2½ Levis) ...    | 1m. 16s. |

## CLASS 2.—Twins up to 1,000 c.c.

- |  |          |
|--|----------|
| 1. P. W. Englebach (7-9 Indian) ...    | X        |
| 2. J. McCann (7-9 T.T. Indian) ...     | 0m. 32s. |
| 3. H. Marsden (7-9 T.T. Matchless) ... | 1m. 24s. |

## CLASS 3.—Sidecars.

- |                                |
|--------------------------------|
| 1. S. H. Y. Birley (8 Zenith)  |
| 2. C. R. J. Roberts (6 J.A.P.) |
| 3. T. Y. Arnfield (6 Enfield)  |

Fastest time of the day was made by J. McCann (Indian).

## Bradford M.C.C.

There were twenty-nine entries and some fine racing was witnessed at Bucliffe Woods Hill on the 21st ult. Results: 1, C. Sydney (¾ T.T. Bradbury), Dyson shield and gold medal; 2, Haswell (¾ Bradbury), silver medal; 3, Fenton (7 Indian), bronze medal. Passenger machines: 1, W. Gilyard (8 Gilyard cyclecar), P. and M. cup and gold medal; 2, C. Finn (6 Enfield sc.), silver medal; 3, G. Gilyard (8 Chater-Lea sc.), bronze medal.

## Liverpool A.C.C.

The reliability trial for the Hobbs cup, postponed a few weeks ago, was run on the 22nd ult. The course was a circular one of about seventeen miles through the narrow winding roads of the Wirral district. The start was from the Clegg Arms, Gayton, which had to be passed four times. A dozen competitors took part, the first to come round dead on time was N. Brown (7-9 Indian), followed by Mrs. Baxter (Rex). Several lost the way. The final calculation showed that Mrs. Baxter (Rex) was nearest to schedule time, being eighteen minutes out in the seventy-five miles run, and she was judged the winner.

## Clapton and District M.C.C.

The above club held its second reliability trial to Cambridge and back on the 22nd ult. Fifteen minutes stop were allowed at Cambridge, but with that exception no other stop was allowed, and the competitor who succeeded in riding the whole distance (104 miles) under these conditions nearest to a consistent speed of 20 m.p.h. between all checks was declared the winner. Speedometers and watches were barred. Results:

Rider and machine.	Total error.
1. A. Hewitt (¾ Premier sc.) ...	12m. 20s.
2. P. Bowman (4 J.A.P.) ...	14m. 53s.
3. R. Wright (¾ Centaur sc.) ...	21m. 15s.

## Leven and District M.C.C.

The above club held an invitation hill-climb on Lang Young's Hill on the 21st ult. Results:

CLASS I. (sidecars on formula).—1, A. H. Alexander (¾ Zenith)\*; 2, J. Christie (¾ Kerry); 3, J. Williamson (6 Rex-Jap).

CLASS II. (singles on formula).—1, A. H. Alexander (¾ Zenith); 2, H. Braid (¾ Norton); 3, R. J. Braid (¾ Trump-Jap).

CLASS III. (twins on formula).—1, A. H. Alexander (2¾ Douglas); 2, A. J. Carlow (6 Rex-Jap); 3, A. G. Braid (¾ T.T. Indian); 4, J. R. Alexander (7 Indian)\*

CLASS IV. (under 600 c.c.).—1, A. H. Alexander (¾ Zenith)\*; 2, A. G. Braid (¾ T.T. Indian); 3, R. J. Braid (¾ Trump-Jap).

CLASS V. (unlimited, over 600 c.c.).—1, J. R. Alexander (7 Indian)†; 2, A. J. Carlow (6 Rex-Jap); 3, J. Wares (6 Rex).

\*Denotes fastest time. †Denotes fastest time of day.

The machine on the scales is a 2½ H.P. two-speed Douglas on which A. H. Alexander was conspicuously successful at Amulree and at the Leven Club's hill climb, the results of which are given above.

## 1913 NEW HUDSON MODELS.

Features: Combined belt and chain drive, hand starter, and decompressor.

THE New Hudson Cycle Co., Ltd., Birmingham, are introducing for next year a range of chain-cum-belt models, which will replace the direct belt drive used hitherto. A description of the  $3\frac{1}{2}$  h.p. model (which we illustrate herewith) will give our readers a general idea of what the firm will produce in 1913, for the new  $2\frac{3}{4}$  h.p. model has an engine of 350 c.c., but is otherwise on similar lines to those of the  $3\frac{1}{2}$  h.p. The engine of the  $3\frac{1}{2}$  h.p. remains the same as last year, with the exception of a decompressor working on the exhaust valve gear, and operated by a neat handle-bar control lever. By this means the lift of the decompressor cam and the escape of gas can be varied.

The chain wheel side of the crank case is now fitted with a long plain bearing, in addition to the usual ball race, so as to minimise the overhang of the crankshaft. The drive is taken from the engine by chain to a sprocket mounted between two phosphor-bronze plates kept in contact by powerful springs.

This device is, of course, for the purpose of absorbing any harshness in the chain drive, and is mounted with the large diameter belt pulley on a double row of Skefko ball bearings, the whole having an eccentric chain adjustment in the bottom bracket. The engine chain is entirely enclosed in a neat oil-tight aluminium case, which may be detached by the removal of a few screws. It is strong, and does not rattle, and allows for ample chain clearance. To accommodate this new form of drive, the frame has been slightly altered in the region of the bottom bracket. A link belt conveys the drive to the belt rim of the Armstrong Mark V. gear. While we were in the works we caught a glimpse of a similar machine fitted with the New Mark VI. gear, which is mentioned elsewhere in this issue.

1913 model  $3\frac{1}{2}$  h.p. three-speed New Hudson with combined belt and chain transmission.

The New Hudson decompressor, showing method of operation.

At the present time a handle starter is geared by chain to the rear wheel sprocket, but it is possible that this will be replaced by a kick starter.

Very neat aluminium footboards are fitted, which pivot at the front on the front footrest bars, and are sprung at the rear. The rubber pads are still retained on the front rests, and give a complete change of position.

As regards equipment, a  $2\frac{1}{2}$  in. tyre has been wisely adopted for the rear and a  $2\frac{1}{4}$  in. in front. The saddle is a Lycett, enabling a very low riding position in conjunction with the dropped frame. The popular Druid forks are used, also stands front and rear, and pannier bags. A much stronger gear-changing rod is used, and the lever is placed about the middle of the tank.

As for the finish and detail work, they are the usual New Hudson standards, which have already made such a good impression on the public.

### AN AMERICAN CYCLECAR.

A few weeks ago we stated that there was a rumour abroad that an American firm was about to place a cyclecar on the British market to sell at about £65. We further stated a few weeks later that the rumour refused to be laid, despite the Ford Co.'s reply to our query that they had no intention whatever of making a cyclecar. We now understand that the Ford Co. is not the firm, but another important American concern is contemplating the manufacture of a cyclecar with either single-cylinder or twin-engine, chain drive to the counter-shaft and thence to the back wheel. The sample vehicle has only one of two rear wheels driven, and the gear box is of the dog clutch two-speed type. It is undecided at present whether the manufacture of this vehicle will be undertaken in England or the States, but the price is to be about £50, and sociable seats are decided on.

The New Hudson power unit, showing spring footboards, detachable chain case, and method of transmission.

## MOTO-REVE

2 - 2½ - 3 and 4 h.p.

Dear Sirs,

You will no doubt be interested  
to hear what your machine will do.  
Riding one of your 2 h.p. 27 guinea  
models, I came from Offord, Hunts.,  
to Scarborough, 186 miles, at an average  
of 18 miles per hour, including stops  
for petrol. Considering that I weigh  
11 stone, this, I consider, is a  
remarkable performance for such a  
small machine, and one which only  
weighs 80 lbs. Congratulating you  
on this remarkable little engine,

Yours truly,

L. M. J.

## Bristol . . . . . Engineering . . . . . Exhibition. . . . .

February, 1913.

The promoter of this Exhibition having been appointed organiser of the Bristol International Exhibition for 1914, and expects to leave for Canada almost immediately for an extended period, has felt compelled to ABANDON the project for 1913, more particularly in view of the fact that heavy machinery could not be accommodated in the building already arranged; but he would, however, be glad to receive enquiries for the larger proposal of 1914, for which a site of upwards of 50 acres of land, close to the city, has been acquired.

Write **THE MANAGER,**  
Central Chambers, St. Augustine's, Bristol.

In answering these advertisements it is desirable to mention "The Motor Cycle."

# CORONET SIDE CARS

## Don't Carry Overweight.

"Coronets" are strongest and lightest. Why fit a heavy sidecar to a 3½ h.p. machine? You have no surplus power, why take surplus weight? Fit a "Coronet," and you will be right.

CAN BE OBTAINED FROM ALL DEALERS.

Model 1. High-class Canoe-front Body, Cranked Axle, and other improvements, £6 6 0.

Model 4. Ornamental Cane Body, as illustration, or close Reed Cane Body, £8 8s.

## 4½ H.P. PRECISION ENGINES.

We carry a large stock of these well-known engines. We will make a liberal allowance for your under-powered engine in exchange. Therefore why not

## GET RID NOW.

All models of Precisions supplied, with or without magnetos, carburettors. Remember—

## POWER IS GRAND.

## WEATHER-PROOF MAGNETOS.

Get rid of your out-of-date magneto, coil, or accumulator, and let us take them in exchange for the latest water-tight magneto.

**BOOTH'S MOTORIES,**  
KEIGHLEY MILLS, BEDFORD ST. NORTH  
(off Pellon Lane), HALIFAX. Tel. 1062.

## THE Sidecar Machine

—a letter of appreciation from—  
**A PRIVATE OWNER:**

Ludwell,  
Salisbury,  
28th June, 1912.

Dear Sirs,

Having covered 2,400 miles on my 1912 6 h.p. REX-J.A.P., the major part with Sidecar, I think I am in a position to express an opinion on its behaviour. It is with a great deal of pleasure that I can express my complete satisfaction.

It is very rare that I have to use the low gear with a 15 stone passenger, the high gear being 4 to 1.

The riding position is excellent—I have ridden for hours without feeling the slightest bit tired. I usually average 30 miles per hour with Sidecar. I have taken the cylinders off once, and then found scarcely any deposit. The engine is wonderfully clean—it would be quite possible to ride in white flannels.

A word of praise for the Dunlop Belt which has gone the whole distance, and is good for many more miles.

You are at liberty to use this in any way you think fit.

Yours faithfully,  
(Signed) R. Gatehouse.

May we have the pleasure of sending you Catalogue fully illustrating the unique features of the REX-J.A.P. ?

## DON'T SPECULATE

when buying a second-hand motor bicycle, see that your purchase is a good investment

You ensure this by selecting a machine from our stock. You will get good value and will be able to put the machine into immediate use, secure in the knowledge that it has been

minutely overhauled, and prepared for the road by us.

## MAY WE SEND YOU OUR LIST?

Each machine is handled by the same efficient workmen in the same well-equipped workshops that have earned for us the distinction of being appointed Official Repairers to all the large motoring organizations—

R.A.C., A.C.U., A.A. & M.U.

## DON'T INVEST

in a new machine without first obtaining the opinion of someone who "knows." It is our business to know what is good in motor cycles, and we shall be delighted to give you sound advice after carefully considering your own particular requirements. Our Agencies embrace all the desirable makes, and we can deliver almost any 1912 model immediately.

## EXCHANGE TRANSACTIONS

form a large portion of our business, and if you wish your present machine taken in part payment for a new one, we will make a generous allowance for it. Let us send you our Exchange Form.

WE WILL ARRANGE TERMS OF PAYMENT TO SUIT YOUR CONVENIENCE.

### Motor Cycle Taxation.

IT is distinct encouragement to us in our campaign against the proposed new system of motor cycle taxation to receive by every post batches of our petition forms duly signed by readers. Even on the first day after publication of our last issue some hundreds of forms arrived, many filled to the last line with the names and addresses of those who, with us, are ready to show their disapproval of the unfairness of the suggested taxes. We have already given examples of the unjust system proposed. It is absurd that a sidecarist should be called upon to pay as much as the owner of an 11 h.p. motor car weighing over a ton and capable of carrying five passengers. The comparison is almost too preposterous to deserve consideration by reasonably minded persons. Another phase of the matter has been brought home to us by one or two letters received with the petition forms. Workmen employed in motor cycle factories are in fear that their positions may be made insecure should the proposed taxes become law, and this applies to many thousands, especially in the Midlands.

To return to a previous pointer of ours, viz., the second-hand machine of ancient origin which the Motor Car Taxation Committee have entirely ignored, a number of riders point out to us that their mounts are entirely out of date, were bought at a bargain price—the most they could afford—and if the new taxes are passed it will mean that the machines are on their hands, for a £3 3s. tax is beyond their means. It seems incomprehensible that these important matters should have been ignored.

An out-of-date twin-cylinder sidecar machine in running order is purchasable at less than £20. An owner of a motor car costing anything up to £400 would pay the same tax if the Taxation Committee's proposals were adopted. Many other examples of the iniquity of the proposals could be quoted *ad lib.*, but they should be patent to anyone who considers the matter intelligently.

We leave our readers to show their disapproval of the suggestions by their signatures on the petition forms issued last week. We ask that they be forwarded to us promptly, as action must be taken at once and determinedly if success is to be attained. Prospective as well as actual motor cyclists may sign the form, also workmen employed in motor cycle factories, garages, etc., who are likely to be affected should the new rates become law.

We refuse to believe that those who have recommended the increase can have foreseen the injustice which they were doing to motor bicyclists, sidecarists, and men engaged in the trade.

### Growing Favour of the Twin Engine.

IT is more than probable that the year 1913 will see a great increase in the number of twin-cylinder motor cycles; there is, in fact, every likelihood of a twin-cylinder boom. Of course, the large twin has been with us for a number of years, and the lightweight nearly as long, but the medium-powered twin machine has up to the present made practically no headway against the 500 c.c. single-cylinder.

Only a few years ago a 500 c.c. single was held to be the equal of a twin-cylinder machine of a capacity of 750 c.c., or half as much again, but thanks to Tourist Trophy Races the twin has received the attention it deserved and has been developed in efficiency. This year, for instance, the twin had so increased in efficiency that it competed against the single on equal terms and won both senior and junior races. Then, again, the power of the lightweight has increased, and, with the addition of a variable gear, the machine has now become a medium weight, which, except for the fact that it is not advisable to attach a sidecar, will equal the performance of the 500 c.c. of two years ago.

Evenness of torque, smoothness of running, excellent acceleration, and the absence of vibration are among the advantages of the twin-cylinder engine. The added complication of an additional cylinder deters many possible buyers, but, after all, this complication is by no means as serious as it appears. It is, of course, rather more trouble to take down two cylinders for cleaning purposes than one, not only because there are two instead of one, but because the nuts are generally rather more inaccessible; there are also double the number of valves to grind in and pistons to scrape. On the other hand, the presence of a second cylinder is often a help to the diagnosis of trouble in the event of an involuntary stop. Another point worth noting is that a twin is much more easily silenced than a single of equal capacity for reasons explained on another page.

Then again, owing to the evenness of torque, much less strain is imposed upon the transmission and gearing, for two light impulses are substituted for one powerful one, the whole machine, including the tyres, reaps the benefit, and the problem of chain drive with its increased efficiency is very much simplified.

## LADY MOTOR CYCLISTS ON TOUR.

Brief account of a tour to the Lake District by two Brighton ladies.

**P**ARTICULARS have reached us of an ambitious tour to the Lake District recently undertaken by two Brighton lady motor cyclists. Miss Eva Plumbridge and Miss E. S. Mortimer, both riders of  $2\frac{3}{4}$  h.p. twin-cylinder two-speed Douglas machines. It is certainly a striking proof of the absolute dependability of the modern motor cycle for two ladies to undertake such a long journey entirely on their own account, and as an incentive to other ladies to go and do likewise we give brief particulars of the roads traversed. On the first day Malvern was reached, a distance of 160 miles—quite a good start off. Near Swindon a delay was caused with Miss Plumbridge's machine by the magneto refusing to spark, the trouble being eventually traced to water in the contact breaker. It took nearly two hours before matters were set right.

From Malvern to Chester (ninety miles) was the second day's jaunt, and on to Ulverston (120 miles) the third day. Ulverston had been selected as the touring centre, and from here various trips were undertaken round the English Lakes, including Windermere, Coniston, West Water, etc., in all completing from 200 to 300 miles in this district. Part of the time a passenger was mounted on the carrier of one of the machines. The weather was not of the best, rain frequently falling heavily.

The run home to Brighton was *via* Burnley, Rochdale, Oldham, Southport—a trying ride if ever there

was one—and thence through the Peak district of Derbyshire to Warwick and Oxford, skirting London to Reigate, bringing the total mileage covered to nearly a thousand.

The two fair tourists exhibited great pluck in continuing the journey in face of adverse weather conditions. They were both struck by the interest taken in the motor cycles and the courtesy shown when passing through the thickly populated Lancashire district.

The little Douglasses again proved their worth. Except for the magneto trouble in Swindon, the only other delays were caused by two punctures and a slightly slipping clutch, due to oil working on to the clutch leather.

At Staines Miss Plumbridge unfortunately got a small piece of stone in her eye; whilst stopping here a lady showed her interest in a practical manner by providing them with tea and drying some of their wet clothes, which action was very much appreciated. The good Samaritan is, we understand, now contemplating

the purchase of a motor cycle. As regards hill-climbing the Douglasses behaved splendidly, and seldom required the low gear ratio. As to reliability, the result could hardly have been more satisfactory. The two ladies were able to manage their own mounts, outside assistance only being requisitioned to put right the rained out magneto.

We are indebted to Mr. F. F. Turpin, of Brighton, for the photograph reproduced.

Miss Plumbridge and Miss Mortimer, of Brighton, who recently toured together on their two-speed Douglas machines.

Group of members of the Uxbridge motor cycle club outside the Chaquers Hotel. The club was formed two months ago and already boasts thirty members.

## Wanted, a Definition of Cyclecars.

How is it that in both the Scottish and English Six Day Trials a cyclecar was permitted to start which weighed well over 11 cwt. minus its passengers! One machine which received awards in the Taunton Trials weighed no less than 11 cwt. 2 qrs. 7 lbs., or 4 cwt. qrs. 7 lbs. over the A.C.U. limit of 7 cwt. If we make allowance for a huge tank capacity, this vehicle must either have carried a kit of spares and tools mostly in excess of those specified by the rules, or, alternatively, it must have weighed more than 7 cwt. ripped, or, again, the published weights are wrong. What has Mr. Loughborough got to say?

## Body Balancing on Cyclecars.

I must accept the assurances of several correspondents that body-balancing by passengers on bad corners is not really necessary. In defence of my paragraph on the subject I can only state that I have watched several famous cyclecars coming in the principal trials of the season, and that I have seen a great deal of this body-balancing done by expert drivers and their mechanics. I do not imply that it is indulged in when turning sharp street corners at low speeds, but I cannot disbelieve the evidence of my own eyes, and whether it is necessary or mere "swank" there has been plenty of it to be seen in negotiating twisty ascents and descents at illegal speeds.

I especially remember one occasion when a very nervous driver was presumably catching up lost time down a long and tortuous pass. His passenger's head was a good two feet outside the track of the car on more than one corner.

## Difficulties about Delivery.

I have received a red hot letter from a reader, who denounces the trade in unmeasured terms for advertising goods which they cannot deliver. As I find myself largely out of sympathy with his diatribe, I must deal with it at some length. There is a good deal of excuse for the fact that articles are often described in the Press which are not immediately obtainable from stock.

Sometimes an impoverished but clever inventor designs some admirable notion. If it were not described and illustrated the notion would be stillborn. A little judicious publicity interests financiers and results in the article being commercially manufactured on a large scale. At the present moment I know of complete motor vehicles which are being advertised on this system. The inventors have perhaps just sufficient capital to manufacture ten samples, and to advertise them. They have sufficient confidence in their goods to spend their tiny capital to the last farthing in the hope of attracting a financier, but in the meantime they can only accept ten orders, and can only supply those orders very slowly.

Such methods may be irritating to the wideawake advertiser, who spots the good thing, but it is hard to

devise any other plan by which the invention could obtain a footing. In other cases, the article is properly capitalised, and the factory is in full working order, but the manufacturer of some part, or the contractor who is pledged to deliver certain raw materials, fails to deliver punctually, and the advertisers are hardly to blame for their short stock. At one period this spring a certain factory had over £10,000 worth of motor cycles standing in their stockroom, all ready for the road, except that not one of them had a magnetto! In another case the contracts for tyres or tubing or castings or some other essential are not punctually fulfilled. The whole process of supply is far more complex than my correspondent appears to realise. He may take one thing for granted, viz., that every manufacturer is burning with eagerness to supply as great a quantity of his wares as possible in as short a time as is practicable; and consequently, wherever delays and disappointments are experienced, there is some real and vital reason at the back of things. In some instances, of course, the entire factory output is contracted for by agents, and immediate delivery may be obtained from large dealers, or from provincial agents who have ordered more goods than their local clients require.

When we fail to obtain immediate delivery of the articles we fancy, we ought to feel a very considerable sympathy for the unfinanced inventor, for the small firm whose trade is hampered by lack of capital, and for the works manager of the big factory who is hung up because his supplies of raw material are slow in coming through.

What annoys us is in reality far more aggravating to a number of persons behind the scenes.

GYMKHANA AT THE STADIUM.

The balloon competition. A. Greenhill (Zenith and sidecar) is about to burst one of the balloons by driving the front wheel over it.

## SILENCERS.

IT is a rather singular thing that the silencing of explosion engines seems to have received comparatively slight attention from scientists. In the case of very large internal combustion engines, such as are used for driving factories and electric generating stations, the problem of reducing noise is very considerably simplified by the fact that there is always plenty of room available, and, as we shall see later on, space is a matter of great importance. That is to say, a large chamber can be let into the ground outside the wall of the power house, and the exhaust gases led direct into that.

It is, of course, true that, during recent years, great strides have been made in quietening the engines of motor cars, but here again space has never been so restricted as in motor cycle design. On the other hand, it is an undoubted fact that this quietening has been largely effected not so much through the proper handling of the exhaust gases as through better design of valve and gear mechanism and a general boxing up of moving parts. For quite a number

Fig. 1.

of years now, the actual silencing of a car engine's exhaust has been quite a simple matter. It is not so, however, with the motor cycle; but why this should be so it is hard to say.

Motor cyclists as such are surely not less sensitive to noise than cars users, yet it is quite obvious that they are quite content to put up with something that the latter would not tolerate for a moment.

### Why Motor Cycle Engines are Noisy.

Two explanations for this present themselves. The first is that for some reason or other motor cycle manufacturers, generally speaking, have been rather slow in producing a really silent machine, and the second is that the motor cyclist, once out on the road and travelling at a fair speed, is not much concerned as to the amount of noise he is making, because he leaves the greater part of it behind him. That the noise made by the majority of motor cycle engines constitutes a nuisance seems to be an undoubted fact, but hardly more so than that the actual user of the machine is rather less to be blamed for this state of affairs than the manufacturer.

After all, the buyer must put up with what he can get; this being always one of the worst features of the period of high commercial prosperity which is at present being enjoyed by the industry as a whole. On the other hand, it is quite impossible to excuse a certain section of motor cyclists who do honestly enjoy

Fig. 2.

making themselves heard over a whole diocese, but, one may reasonably ask, is it fundamentally their fault when silencer design is so bad that the mere kicking open of a cut-out will give the speed merchant that extra five or seven more miles an hour that he is so pardonably keen on?

First and last, therefore, the manufacturer should bear the brunt of the blame, the only thing that can be said on his behalf being that he has undoubtedly got a rather difficult problem to solve.

### The Cause of the Noise.

If a manometer, or pressure gauge capable of reading small values, were placed close to the open exhaust of a single-cylinder engine, it would register normal atmospheric pressure during three strokes of the piston, and a comparatively high pressure when the exhaust gases were being ejected. It is these sudden changes in pressure which cause the noise; and it is important to notice that it is the change and not the pressure itself which is responsible. In other words, if the pressure of the exhaust gases were constant at the point at which they impinged upon the atmosphere, it would make very little difference whether they issued at a high pressure or a low one.

Noise is produced not by the pressure but by its inconstancy. Before proceed-

Fig. 3.

ing any further it is necessary to make it quite clear that the explosion of the charge inside the temporarily sealed cylinder is quite inaudible until the exhaust valve is opened. This is a fairly obvious thing when one comes to consider it reasonably, and it is pointed out merely because the suggestion has been not infrequently made that the reason

why air-cooled engines are generally noisier than water-cooled ones was that in the case of the latter the thickness of cylinder wall and jacket helped, as were, to keep the noise in, whereas the thinner wall of the air-cooled cylinder let it through much more readily. Dynamometer exploded within a very strong hermetic chamber gives rise to a noise that is just perceptible, and this is most probably due to the sudden setting up of internal stresses in the material of the chamber itself.

### The Ideal Silencer.

Fig. 1 is a diagram giving a rough idea of the change of pressure at the exhaust port of a single-cylinder engine. The question now arises—how to get rid of the sharp peaks A, B, C, and D, or, you like, how to chop the tops of mountains off and utilise them for filling up the valleys. One point may now be noticed in connection with this analogy, and that is, that when the unevenness of pressure has been flattened out, the resulting constant pressure must be something higher than normal.

Fig. 4.

The ideal silencer is clearly the instrument that will enable an intermittent pressure of gas to enter at one end and issue forth at the other in a perfectly steady stream. Now, if space were of account the whole trouble could be overcome at once by leading the exhaust gases into a large chamber, many hundreds of times larger in capacity than swept-out volume of the motor cylinder, and allowing them to emerge through quite a small pipe. It will be readily understood that the addition of such a volume to what is already a very large volume of gas would, in this hypothetical case, lead to a very small net increase in pressure, and the larger the chamber provided, the smaller would this increase of pressure be. Unfortunately, motor cyclists, it is to be feared, would rather object to carrying a fair size gasometer on their machines, so the above method has to be dismissed as impracticable, although its principle must essentially be adhered to.

The next most obvious method is to take advantage of the fact that gas, however light it may be, has inertia, and is also elastic. It will be realised that when the exhaust valve opens the gases are not only open at a considerable pressure but that they are also (as a consequence) forced through the exhaust pipe at a very high rate of speed. Hence it is obvious that, for silence to be maintained,

bers.—

and, this series of sharp impacts must be levelled down. This can be done by erecting a perfectly straight pipe of uniform bore and of very great length to the exhaust, and the action will then be as follows:

### Effect of Long Exhaust Pipe.

Assuming that the air contained in the pipe is quite stationary and undisturbed, when the exhaust valve is opened the gases will accelerate it towards the tail end. Now, if instead of air in the

Fig. 5.

if there were a series of balls these would be shot out at the one end just as fast as the gases were shot in at the other. Air, however, or any other gas, being compressible, cannot transmit an impulse in this manner, being restrained from doing so not only by its own inertia (the more important factor), but also by its friction upon the internal walls of the pipe. In other words, that part of the column of air in the pipe nearest the exhaust valve will be highly compressed, and, consequently, will lose velocity, so that the part of the column of gas next to it will not be so rapidly accelerated as the first one was. At the same time the inertia of the gas column will again produce slight compression in this part of the column, so that further and further on the acceleration will be less and less.

Provided that the pipe be of sufficient length, therefore, rapid changes of acceleration at one end will be converted to a constant average velocity at the other, and accordingly the pipe will act as a silencer. But it would need to be a long one were it not that the exhaust gases are hot. This fact at once simplifies the problem, because it means that the speed can be rapidly reduced by the effect of reducing the volume by cooling.

### Cooling the Gases.

It will hardly be required of the obvious fact that if a certain volume takes a certain time to pass down a pipe, half the volume will pass down in the same time at half the velocity. The effect of this is to shorten the pipe required by an enormous amount, but, unfortunately, not enough to allow it to give a perfect silencing action on a single cycle, unless thirty or forty feet of pipe hanging behind is considered a matter of no moment! Incidentally, it

Fig. 6.

is necessary to point out that a device of some kind would need to be fitted even to this enormous exhaust pipe in order to break up the sound waves. If it were of perfectly plain and uniform bore, the waves would be transmitted down it uninterrupted. The waves, however, can easily be broken up by the use of a fan-tail end, see fig. 2, or by the interposition of a small "expansion" box, as shown in section in fig. 3, or by allowing the gases to emerge through small holes, as illustrated in fig. 4, or even by reducing the diameter of the pipe so as to provide a conical jet, fig. 5.

It will be readily understood that, provided the velocity of the gases has been reduced to a constant one, and the volume also reduced by cooling, quite a small final orifice may be used without giving rise to "back pressure."

### What is Back Pressure?

Of this phrase some explanation is needed, as I believe it is not generally quite properly understood. "Back pressure" is simply the resistance which a gas exhibits to pass round sharp corners or narrow constrictions when travelling at a high rate of speed. The power thus absorbed by any given resistance varies as the cube of the speed of the fluid, so that it will very easily be seen that to insert any form of constriction or baffle,

Fig. 7.

or sharp corner, close to the exhaust port is simply to waste power, since near this point the gases are travelling at an enormous rate. Consider the case of an engine in which the exhaust port area is one-eighth of that of the cylinder bore. The terminal pressure at the commencement of the opening of the exhaust valve will be roughly thirty pounds to the square inch, that is to say the cylinder will contain twice as much gas as it would hold at normal temperature and pressure. Now, with the engine revolving at 2,000 revolutions per minute, and the exhaust valve being open for the whole force piston stroke, it is clear that the speed of the gases through the exhaust port will be sixteen times the speed of the piston on the exhaust stroke, because there are two volumes, and the port is of one-eighth the area of the piston. An engine 85x88 mm. bore and stroke, 500 c.c., at 2,000 revolutions per minute has a piston speed of, roughly, 1,200 feet per minute, so that the exhaust gas speed is 19,200 feet per minute, or 216 miles per hour. I admit I have taken a rather favourable, perhaps extreme case, but it serves to make one realise what sort of speeds are being dealt with.

And, if it does nothing else, it at least indicates the utter futility of trying to test a silencer for back pressure by blowing down it—quite a common practice which has been indulged in from time immemorial—or, rather, ever since motor cycles have been made.

### Speed of Gases at Silencer End.

Assuming that the silencer, of whatever kind that is used, reduces the gases to a constant velocity, and likewise their volume by half, it is easy to see that their issuing speed will only be some 27 m.p.h.—one-eighth of their initial speed, since the volume is half, and the final exhaust port is open four times as long as the exhaust port. From this it is

Fig. 8.

simple to calculate that a baffle plate or other resistance placed close to the engine end of the exhaust pipe will absorb 512 times as much power as when it is placed at the farther end.

Before proceeding to deal with actual silencing devices, it is necessary to turn aside to consider one or two points which have a bearing on the matter.

Firstly, comes the effect of increase of the number of cylinders. It is obvious from what has been said above by increasing the number of cylinders which (this is important) exhaust into the same silencer, silence will be far more readily attained for the reason that the impacts upon the gases already in the silencer will follow one another with greater rapidity, and in consequence the acceleration of these gases will be far more steady. In other words, four cylinders are more easily silenced than one cylinder equal in size to one unit of the four, and of course, much more so than a single-cylinder engine of the same power or capacity.

### A Multiplicity of Cylinders Easier to Silence.

If an infinite number of cylinders were possible no silencer at all would be needed, but only a short pipe from which the exhaust gases would issue forth at a perfect constant, although prodigious, speed; that is to say, all the "peaks" would be removed from a pressure diagram taken at the terminal end of the

Fig. 9.

pipe. The four-cylinder F.N. and the twin-cylinder two-stroke Scott (four cylinders, in fact) are very naturally quiet machines, but the silencers used on them would be far less effective if attached to a single-cylinder motor of the same capacity.

The concluding instalment of this instructive article, by W. G. Aston, will appear in our next issue.

## XL'ALL SADDLES.

Two new saddles have been produced by XL'All, Ltd., of Moseley Street, Birmingham, as additions to their present models. The first is similar to their present pan seat, but is extended upwards at the rear to form a back rest, the whole being padded in their usual style. In the second case the saddle is as usual, but the levers and framework

New "XL'All" combined anatomical seat and back rest.

are made in a considerably neater way, there being only two stampings in the whole construction. The system also allows of a lower saddle position, as the stampings can rise into the forward peak of the seat.

## A BINKS ENGINE.

We illustrate herewith a novel engine designed and made by Charles Binks, Ltd., of Eccles. Mr. Binks does not intend to market the engine, but constructed it with the idea of discovering the maximum power obtainable from a

500 c.c. air-cooled engine. We hear that the results already obtained have been very satisfactory, and have been promised the use of a motor cycle fitted with this engine so that we may form our own opinions. The greatest difficulty experienced to date has been to make a cylinder strong enough to withstand the terrific force

of the explosion, the compression being exceptionally high. The novel arrange-

ment of the overhead valves will be noticed. They are set at an angle of 45°, and so that an even thrust may be obtained the tappet rods are crossed. The engine has been built for speed only, and consequently the reciprocating parts are extremely light.

## A RUN ON A LEA-FRANCIS.

We experienced a most enjoyable run of about seventy miles one day this week on the new Lea-Francis motor bicycle, which was described and illustrated in detail on August 29th, pages 934-5. Rain fell heavily at the start, but it made no difference to the L.F., and taking the shortest route to Edge Hill we averaged twenty-five miles an hour by Cowey speedometer, so as to arrive at the hill with a warm engine. We were told the machine would climb the hill on the top gear of 5 to 1, but as the road was wet and holding we were not surprised to find that a combination of a 13 stone rider and thick mud demanded a lower ratio. However, considerably over halfway was reached on top, and on the lower gear and with the throttle nearly closed the Lea-Francis went over the top with the greatest ease.

So much for hill-climbing. We will now describe our experience of the running of this machine from a touring point of view. The L.F. has been designed primarily for tourists and those who want to climb hills without rushing. Firstly, the twin-J.A.P. engine runs beautifully, and closely resembles a four-cylinder so far as evenness and balance are concerned. The engine weight, etc., is well forward, which improves the steering by distributing the weight better over the length of the wheelbase. The saddle position is comfortable, and the handle-bar position ditto; these, combined with springy wood footboards, add greatly to the pleasure of riding. The chain transmission must be most efficient running in oilbath cases; the chains are hardly heard, and the gear is quite noiseless. Special silencing renders the engine almost inaudible; the result is a quiet running machine, which attracts attention by its polite manners. By means

of a kick starter the engine starts once on the pilot arrangement of Senspray carburetter fitted to the machine, and accelerates very rapidly. Gear changing is easy, and once away the machine will average 25 m.p.h. with the throttle lever on hand practically closed. This proves the loss of power in gear and transmission very small, or the machine could average the speed it does with an engine of 60x76. 420 c.c. The maximum speed reached by the machine was 52 m.p.h., if the speedometer fit truthfully.

No noise arises from the chain and although the machine is a little rough for the engine power when compared with some other belt-driven models, doubt if its speed is appreciably reduced thereby, even up hill. The extra

Acting on the suggestion of a sidecar Lea and Francis, Ltd., Coventry, have a reflex light for sidecars which has a red rear light and a white front light, a good method of showing the full width of the sidecar both from front and rear providing light on the overtaking or oncoming vehicle sufficiently brilliant to illuminate the reflex device.

is also an advantage in some ways enables the machine to hold the better, and gliding better describes the motion of the Lea-Francis than anything else. Incidentally, we saw the rear wheel attached by means of the patented rear axle and solid wheel pin. Mr. time for the complete operation was only seconds. Fortunately we did not have to resort to this, but it is comforting to know that in the worst case of tyre repairs to know that the wheel can be dropped out in a minute, leaving the chain and wheel in position. For further details concerning it, we refer them to our issue of October 29th last.

Latest French cyclecar, the "Baby," which is propelled by a 6-8 h.p. water-cooled Buchet engine, has four speeds and reverse. The frame is of pressed steel, and the steering by rack and pinion. The Central Garage have secured the agency in this country.

# A Test Run on the Singer Cyclecar.

From Four to Forty m.p.h.  
on top gear.

Consumption over Forty  
Miles to the Gallon.

If every Singer cyclecar which emerges from the factory is as good as the one we had the pleasure of testing during a week-end jaunt of 300 miles, we will have cause to complain, but we have every confidence in saying that future models will be better. Naturally, our trial of the machine in its raw state was not wholly free from trouble—indeed it would have been almost a miracle if a three day trial of a car in its chrysalis stage did prove a non-stop affair—but we were glad to record that the stoppages were such as could be comparatively easily overcome, and the ailments such as can and will be quickly remedied in the well-equipped works of the Singer Company.

A Claudel carburetter had been fitted the day before we took over the machine, and this was an immense improvement, for the engine would turn over slowly and immediately accelerate on sweeping open the throttle (which works on a quadrant in the centre of the steering wheel) without a suspicion of choking. We set out along the main Coventry-London Road and soon realised that in the Singer we were handling a lively little car as smooth in running as one could possibly expect a light car to be. The even torque of the four-cylinder engine and the excellently upholstered seats did much in fact to dispel an underlying notion of ours that no car of light weight could be called comfortable at speed. The fixed magneto ignition seemed to be no drawback at all, for never once did the engine show any tendency to kick back when starting, and yet a speed exceeding 40 m.p.h. is possible under favourable conditions. Braunston Hill and the main street in Daventry called for no change of gear. At Leedon we had occasion to make a halt and reverse, and in so doing the change speed levers seem to have not strained, for the gears were afterwards rather difficult to engage. An adjustment effected, the car ran merrily to St. Albans, *via* Dunstable, on top gear. Here we elected to stay the night.

## Low Petrol Consumption.

Although the Singer had run several miles before we took the wheel, we were agreeably surprised to find that the tank would only take an additional two gallons of petrol, which gives a consumption of over forty miles to the gallon—splendid for a four-cylinder engine of 1,000 cc. The engine was difficult to start from cold, due to the absence of a shutter over the air inlet. A rag stuffed in the hole soon set the engine buzzing merrily. The Great North Road was to be our testing ground this day, so after sundry trips in the morning, we struck out for Hatfield in the early afternoon, and

having now gained confidence in the machine we opened out more and found we could easily maintain a speed of 30 m.p.h. A bubbling at the radiator cap, however, caused us concern on hills; this, of course, will be got over by the adoption of a larger radiator. The wind was blowing from the east—direct on to the carburetter side. Whether this was the cause of the carburetter freezing we know not, but we had the first indication by a spluttering at the exhaust pipe outlet, and a gradual diminishing of power. We were at first inclined to ascribe the cause to a choked carburetter, but twenty minutes spent dismantling this revealed no cause for the stoppage. A swing at the handle and off the engine went. This happened on two other occasions—once outside Stamford in the dark—the symptoms being repeated exactly. The reason the engine started off again after standing for a time was due to the hot cylinders conducting heat along the induction pipe and thawing the frost. A shorter inlet pipe seems the obvious remedy, and this is receiving attention. It came on to rain when nearing Grantham, so we put up the hood and got along very cosily, winding our way through the crowds in the streets on top gear at little more than a walking pace. Gonerby Hill called for the second gear, but thereafter splendid time was made to Newark, for the moon appeared to light our track. We stopped here for the night, the afternoon run being over 100 miles.

## Up Bunny Hill on Second Gear.

Next day we set out for Coventry *via* Nottingham, Loughborough, and Leicester. A business call in Nottingham took us through the town, and again we were delighted with the way the car rolled along smoothly and practically noiselessly, except for a soft engine purr.

Bunny Hill was the most severe hill on our route, and this the Singer climbed mostly on top, calling for the second gear on the last steep stretch. We descended the hill again and repeated the performance, so no one need have fear of the hill-climbing capabilities of the Singer with a first gear in reserve. On one or two occasions we had opportunities of comparing speed with larger cars, and we think more than one owner was surprised when the little low grey car sped past with no other noise than a slight hum in the gears, and an exhaust as healthy and crisp as a Brooklands racer in the distance, this, of course, with the throttle open. Our last hundred miles had been as enjoyable as they could possibly be. In Leicester we stayed for tea, and on attempting to restart found the gear strikers

(1) In the five miles an hour limit at Fenny Stratford.

(2) The Dunstable chalk cutting on Telford's highway.

(3) At the top of Bunny Hill on the Nottingham-Loughborough Road.

had again become strained in some way. Nothing would induce the car to get off the mark, so we had to suffer the ignominy of pushing it to an adjacent garage, half the loafers in Leicester on our heels. A short delay and matters were put to rights, so we set out in the gathering gloom on our last trip. What a boon it is to be free of the worry of lubrication. The sump of the Singer is replenished each morning and the mechanical pump can be relied upon to do the rest.

#### Does an Engine run Better at Night?

We answer the question emphatically, "Yes." The way the engine purred away, answering every movement of the throttle lever on hills or level ground, caused us to excuse it entirely for that push in Leicester. We should repeat that the machine was merely in the testing stage, it was the original model

we tried, and our *contretemps* will give the reader some insight into the work of a tester, though our remarks would have been considered a pleasant jaunt. Mr. Ma recognised the Singer cyclecar from the illustration published, and expressed pleasurable surprise at its build and small proportions; the photographs do not convey accurately an idea of its proportions. "But it is hardly a cyclecar," one or two remarked. May be not, but this is what amuses us. A certain four wheeler, which performed conspicuously in the 5 Days' Trials is accepted as a cyclecar without question yet the Singer is nearly 2 cwt. lighter! If people were governed more by facts than mere guesswork it would be better. The artillery wheels on the Singer have misled nine out of ten weight estimators. The Singer promises to be the centre of attraction at Olympia. It is a Rolls-Royce of cyclecars—and it won't be cheap.

## A New Motosacoche Departure.

A NEW experimental Motosacoche machine which has just arrived from the works was lately seen on Brooklands Track, when, we are told, it was unofficially timed to do seventy-three miles an hour. These figures show that the engine is a startling departure from former Motosacoche practice. It is a V twin of 750 c.c., fitted with overhead mechanically operated inlet valves. Both inlet and exhaust valves are of large dimensions, and the former are carried in a dome, consisting of a casting bolted on to the cylinder by three bolts. The inlet springs are external. The exhaust lifters are of the exterior type, and are coupled by an adjustable rod, so that both valves may be set to lift simultaneously or one may be made to rise before the other, allowing the machine to run on one cylinder only. The ignition is the latest type Bosch magneto, driven by enclosed chain. The pipe carrying waste oil from the relief valve is directed on to the chain running from the counter-shaft to the rear wheel. The exhaust pipes are of generous dimensions, and that from the rear cylinder joins that from the front close below the union nut, the final pipe extending to a point well in the rear of the machine. It must be clearly understood that this motor bicycle is purely experimental, having a short frame and being suitable only for track work. It is very light for its horsepower. A glance at the accompanying illustration reveals the extreme cleanliness of the crank case, which

we are assured has not been cleaned since the machine underwent its preliminary tests on the track, while it will be noticed that the usual type of Motosacoche gear fitted to the chain-driven models is employed. The engine, which impressed us most favourably, we understand, mainly for sidecar and cyclecar work.

A big twin Motosacoche, rated at 6 h.p.

## QUESTIONS & REPLIES

S.R.J.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Compression.

? I find that on turning my pulley backwards there is decidedly better compression than when the same is turned forwards. The piston rings are almost new and are a good fit. Can you suggest anything to explain this? —G.B.

Probably, in turning the engine backwards you find a slightly different resistance of the cams against the tappets and springs, and thus the compression seems to be greater, but this is really not the case.

### Chatham to Plymouth.

? I propose making a trip with my  $3\frac{1}{2}$  h.p. Bradbury and sidecar from Chatham to Plymouth. I want to put up for the night somewhere *en route*. Will you kindly tell me the best road to take, avoiding large towns, so that I can arrive comfortably on the second day? —F.A.R.

We should recommend the following route: Chatham, Wrotham, Riverhead, Westerham, Redhill, Reigate, Dorking, Shere, Guildford, Farnham, Odiham, Basingstoke, Andover, Amesbury, Hindon, Wincanton, Ilchester, Ilminster, Honiton, Exeter, Chudleigh, Ashburton, Plympton, to Plymouth. A good place at which to stop the night would be either Basingstoke or Whitechurch.

### Position of the Plug.

? I should feel greatly obliged if you would kindly furnish me with an exact explanation as to why you experience a loss of power by placing the sparking plug of a side-by-side valve engine, with ordinary magneto ignition, over the exhaust valve, in proportion to the power obtained by the plug being in the usual place, viz., over the inlet valve. I feel sure that this will prove a source of much interest to your readers. —N.A.G.

There are two reasons: (1.) When placed over the exhaust, the plug points are much more likely to get hot and cause preignition combined with a feeble explosion, as they have not the advantage of being cooled by the incoming gases. (2.) When placed over the inlet valve, the gas in the neighbourhood of the plug is purer and less contaminated by the residual exhaust gases from the previous explosion, hence a quicker explosion and consequently more power.

### Loss of Compression.

? I have lately had my engine rebushed and new piston and rings fitted. When I got the machine home from the repairers there hardly seemed to be any compression at all, but the repairer said that I should have to run it 100 or 200 miles, when the compression would be right. However, I have run it about 300 miles, and it will take me solo at about twenty miles per hour, but when I put the sidecar on the speed is painful—ten or twelve. Just after being rebushed it would not take any extra air at all, so I had a choke tube put in (none in before), and then it would take about half throttle and a half extra air, which was an improvement, but when the sidecar is fitted it wants three-quarter throttle and no extra air to give twelve miles per hour on the level. B. and B. carburetter, jet .031. The engine gets very hot. —J.J.M.

Evidently the repair job has been done

very badly, and we should strongly recommend you to insist upon the repairer putting it in order again. A new piston may be needed. We should say that by now the engine was properly run in. As to the exact cause of the trouble, it is impossible for us to say. The machine should really be taken down again, and every part verified, especially the bearings. Possibly a tight bearing might cause the failing in power, or, as we said before, a new piston as well as new rings may be necessary.

### Cancelling Registration Numbers.

? Last September, 1911, I sold my motor cycle and wrote to the clerk of the peace asking him to cancel the numbers, which, it appears, he did not do because I did not tell him to whom I sold it, and the result is I have had the police after me. Could you please tell me if I ought to tell him to whom I sold the motor cycle? —A.M.

We have never heard of it being necessary for the county or borough clerk to refuse to cancel a number because he is not told to whom the machine is sold. If you have taken the number off your machine your responsibility ends, but if the number remains on the machine it rests with either you or the purchaser to acquaint the authorities of the change of ownership, and pay 1s. for the number to be transferred. If, however, you cancel the number, the buyer must re-register the machine.

### Hints on Balancing.

? Please tell me how to check and improve the balance of a single-cylinder engine. —J.B.

We published an article on balancing engines on June 2nd, 1909. Shortly, you proceed as follows: Stand the flywheels beside weighing scales, place the piston on the pan, keeping connecting rod horizontal; this gives reciprocating mass. Opposite to the crank pin and at the same radius hang a weight equal to half that of the reciprocating mass by means of a small hole drilled in the flywheel and a bent wire. Next place the whole upon two level rods with a mainshaft on each rod, and test for balance. The flywheels should remain in any position; if they do not, drill out metal from the heavy side until the balance is perfect. It is, of course, desirable to drill the same amount of metal out of each flywheel.

S. A. Rowlandson ( $3\frac{1}{2}$  h.p. Rudge), who tied for second place in the Birmingham-Carlisle-Birmingham 24 hours' run with 13 minutes error. The rider finished up his holidays with this trial, totalling 1,600 miles in 14 days.

## Loss of Power.

? I should be very pleased if you could enlighten me on one or two points, namely: (1.) Engine getting very hot and refusing to take small hills. (2.) Engine whistling when the throttle is nearly closed. (3.) The machine I refer to is a 1903 Triumph, and I have fitted a new cylinder and piston. There were two small springs on the crankshaft, which I removed. Would they be for lifting oil up to the cylinder? I have been giving the machine a charge of oil every ten miles.—NOVICE.

(1.) The cause may be bad carburation, incorrect timing, carbon deposit, or wear of the exhaust valve lifting mechanism. (2.) This may be nothing at all, merely the hiss of the air in the carburetter. (3.) The two small springs you refer to are for catching the oil and directing it on to the bearings.

## Water Cooling and Easy Starting.

? I should like to have your opinions and advice on the following questions: I have been much impressed with the Scott, as an ordinary coat does not seem to be splashed, and can be worn over the knees. (1.) Would you consider it as good a choice as any? (2.) Is there much trouble with radiators leaking, etc.? (3.) Is there any method of preventing the water freezing if left outside in frosty weather? (I ask this because I have heard of adding spirits to the water in the lamp generator to prevent freezing up.) (4.) If the compression is good, is the engine likely to be sound, supposing I buy a second-hand one? (5.) Is it likely to soon lose compression? From the explanation of its working in your handbook, I consider a good piston fit is everything in this machine. (6.) Does it start from cold easily? I have a mile or two only, and at present can walk it almost as soon as I can get the machine ready and my overalls on. (7.) Could you tell me the real or actual horse-power on the road? The 1912 has larger bore but is still called  $3\frac{3}{4}$  h.p. (8.) Is it heavier to handle than, say, a standard  $3\frac{1}{2}$  h.p.? (9.) With regard to my present machine (70 x 76 J.A.P.) there is nearly  $\frac{1}{16}$ th clearance at the base of the valve stems. I gather that this is too much. How can I reduce it? (10.) When I leave it out of doors a few hours, and come to start it, it runs badly for about half a mile. It will stop a few times and is then all

right. Can you suggest anything beyond the petrol flow? The jet is clear. (11.) Shall I have to sell this before I get another cycle, or pay for licence again? (12.) Is this about the best time for buying second-hand machines? It seems to be from the list in *The Motor Cycle*.—A.W.

(1.) Yes, we consider the choice to be a good one. (2.) No, you will not be

N. G. Blackwell (6 h.p. Zenith), winner of the Manufacturers' Union Trophy for the best performance of a private owner in the Birmingham-Carlisle-Birmingham 24 hours' run.

troubled with the radiator leaking. The radiator is a particularly good one. (3.) Glycerine is sometimes added, but it is perhaps safer to empty the water out in frosty weather, unless you keep the machine in a shed, the temperature of which does not reach freezing point. (4.) You had better not buy a second-hand one unless you get someone who understands the machine thoroughly to examine it and send in a satisfactory report about it. (5.) Naturally, it is most important that the crank case compression should be retained. (6.) It starts from cold quite easily. (7.) We should say it develops about  $4\frac{1}{2}$  h.p. (8.) It is not heavy to handle, as the weight is very well distributed. (9.) The clearance is rather too much. You can buy adapters for fitting on to the bottom of the valve from the Service Co., Ltd., 292-293, High Holborn, W.C. (10.) The machine probably runs badly because it requires warming up. Perhaps the carburetter is rather too far away from the cylinder. (11.) If you are using both machines at once you will have to procure an extra local taxation licence. (12.) Yes, second-hand machines can be purchased fairly cheaply now.

## Overheating.

? I should be much obliged if you will settle an argument I had with a friend of mine. He says that if a motor cycle is getting plenty of lubricating oil it will not heat up. I was riding my cycle—a twin Rex—one night, and owing to fault in carburetter starving engine it became very hot after I had run about six miles. Can heating be caused through a defective carburetter?—G.N.R.

Most certainly, an incorrect mixture causes overheating. A motor cycle engine will overheat if it receives an insufficient quantity of lubricant, but if the overheating is from another cause altogether—say from carbonisation, late opening of the exhaust valve, incorrect timing, or as above—it will overheat, whether it is flooded with oil or only given a normal amount.

## READERS' REPLIES.

In reply to enquiry of "E.H." (Northfield) in *The Motor Cycle* recently, I had the same trouble with a Minerva, viz., overheating and failure to answer throttle after being half open. I tried adjusting the carburetter in every way, but found no improvement; the engine got so hot that two cylinders were cracked between valve caps. I then tried a  $\frac{1}{16}$ in. liner under the cylinder, and so reducing the compression which turned out a complete cure. I use a 0.32 jet in a B. and B. carburetter.—H. J. TREVETT.

## EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"M.C." (Godalming).—Lukin carburetter on twin lightweight.  
 "E.A.M.L." (Louth).— $3\frac{1}{2}$  h.p. Triumph with Mabon clutch.  
 "B.R." (Lincoln).—Overhead valve engines, various makes.  
 "G.S.B." (Cheadle).—1912 Douglas model K for general reliability.  
 "R.M." (Hatch End).— $3\frac{1}{2}$  h.p. Bat, Zenith, and A.S.L. models.  
 "R.D.E.D." (Punjab).—5-6 h.p. two-speed Clyno and sidecar in hilly country.  
 "A.C.B." (Windsor).—Binks two-jet carburetter, racing or touring models, on 1912 Douglas.  
 "J.G.M." (Stockton-on-Tees).— $3\frac{3}{4}$  h.p. Scott and Canoelet sidecar, 7 h.p. T.M.C. and sidecar. Consumption and freedom from vibration and noise.

MOTOR CYCLE RACING AT THE STADIUM.

An impression of a motor cycle race at the Stadium (which track is insufficiently banked for high speeds). The photograph was taken on the occasion of the N.W. London M.C.C. gymkhana.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

### Springing of Motor Cycles.

Sir,—I have read "Senex's" letter *re* "Road Shocks," and fully endorse his remarks. It is regretted that our leading manufacturers have not given some attention to this important defect. Surely a motor cycle should be sprung as much as any other road vehicle! It is the only speedy one that does not possess this important adjunct. I hope the leading firms will make a standard fitting of a spring frame for their next year's models, which will be more conducive to comfort and longer life of the machine and tyres.

SPRINGUS.

### Experiences with Dissolved Acetylene.

Sir,—I have read a letter from "J.H.K." seeking for information concerning the above.

For the past eighteen months I have had on my Scott one of these outfits. They fit quite snugly on to the down tube of a Scott, and take up very little room. The motor cycle size costs complete £3 15s., and when the cylinder of gas is empty, it will be replaced by a full cylinder for 2s. 6d. I never would again return to the old-fashioned generator, which requires considerable attention to ensure good lighting.

DR. K. B., F.R.C.S. Eng.

### Importance of Efficient Lubrication.

Sir,—We noticed a letter from W.D. Motors in a recent issue to which please permit us to make a short reply. The Veloce engine is fitted with ball bearings which do not require lubrication under pressure. By means of a pump a clean and ample supply of oil is forced through all vital parts of our engine, including the gear wheels. We claim to lubricate our engine and gears mechanically in a more efficient manner than is accomplished in any other motor cycle.

VELOCE, LTD.

### What is a Cyclecar?

Sir,—I notice there have been a few letters in your journal about the new Singer cyclecar. Perhaps it is on the border line, but, from a mechanical point of view, I think it one of the best cyclecars yet manufactured. The three-speed gear box and shaft drive is, in my opinion, far better than friction or belt drive. In some makes of cyclecars the belt has to run on the bottom of the pulley to get a free engine. I may say I have no connection with the Singer firm in any way, but should like to hear more about this machine.

T.D.

Sir,—I note with considerable surprise that the latest production of the famous Singer factory is described in your columns as a "cyclecar." Now, sir, to my mind, and I am sure to many others, this description is obviously wrong. Surely a car fitted with a four-cylinder water-cooled engine, gear box, and live back axle—in fact, a small edition of a large car—ought not to be included in the same category as many of the light three and four-wheeled cyclecars constructed on motor cycle lines? Of course, I am quite aware of the A.C.U. definition of a cyclecar, but this seems to be the very root of the evil. We might just as well include several of the many light two-seated motor cars and call them cyclecars. To me it would seem most unfair to allow a vehicle of the Singer type to compete against some of the genuine examples of what a cyclecar ought to be.

We have already had a most excellent example of over-development in the tricar, and what applied to that class

will apply to the cyclecar. The only way in which to stop this is to fix a price limit. The ideal machine for the man of moderate means is one constructed on cycle lines and, above all, coming within the meaning of that alluring term, "the £100 motor for two." EDGAR RUSSELL.

### Tyres and Tyres.

Sir,—With regard to Mr. B. H. Davies's letter "About Tyres." As an Irish rider, accustomed to vile roads and lanes in my ministerial work, I cannot agree with his remarks with regard to the 35s. type of cover. I weigh fourteen stones, and the original Clincher tyre supplied on my 1911 Triumph is still going strong at 4,410 miles. It has done service on both wheels, and, with the exception of a slight tendency to slip round in the rim when soft, is still in wonderful condition. Mr. Davies says, "These gashes do not admit of any lasting repair." I had two gashes on this tyre (glass in each case), and I sent it to the Clincher Co., who put in new pieces, and the tyre has since done 2,179 miles by speedometer, the repairs show no signs of severing from the original cover, and so I do not agree with "the first gash sounds the death knell of the cover." These tyres do not puncture in the way your correspondent states—twisted copper wire thorn catchers on the stays has hindered me from getting a puncture in the last fourteen months. I have no interest in the above company. I am an absolutely satisfied user. BALTIE.

### A Home-made Sociable.

Sir,—I am sending you herewith two photographs of a cyclecar I have just built. I find it runs well and is very roomy and comfortable. It is fitted with a 7.9 h.p. Peugeot engine driven by chain to counter-shaft and then by belts to the rear wheel. There are two belts, one for top and one for bottom speed; the pulleys are engaged on counter-shaft by dog clutches. I think it quite possible to be built for about £80. JAMES MATSON.

A locally assembled three-wheeled sociable. See letter from James Matson.

### The Braking Effect of Compression.

Sir,—A correspondent states that the result is due to the energy used in drawing in and expelling the gas from the cylinder. Now, when a gas is compressed it becomes heated; if none of this heat is lost (*i.e.*, if the gas is compressed adiabatically) the gas would expand again to its original volume without absorption of more energy; but if this heat is lost through conduction through the cylinders, work will have to be done to cause the gas to expand again to its initial volume, for work is equivalent to heat. I should be glad to know if any of the braking effect can be attributed to this cause.

INVESTIGATOR.

### Three and Four-wheeled Cyclecars.

Sir,—In your issue of the 19th ult., Mr. B. H. Davies says *re* above that he does not consider a tricar safe should the driving wheel suddenly deflate or burst at a corner—a very rare occurrence indeed. I have driven an A.C. tricar for thousands of miles during the last two years, through Devonshire, Dorsetshire, etc., and have never had a sideslip nor the slightest indication of tilting, although I round nearly all corners on top gear.

On the 22nd ult., for the first time, my rear tyre suddenly deflated at a corner in a narrow lane near Mitcham Junction through being pinched by a new outer cover, but, although I rounded another corner just beyond, there was not the least indication of tilting, simply a gentle swerving motion. What Mr. Davies says is doubtless true of the old, high, narrow type of tricar, but it is evident he has not had much experience with the A.C. broad built sociable (4ft. 6in track), which I doubt if anything less than a brick wall could overturn. With three up, I have run sideways on to a steep bank and came safely on to the road again.

I am not a servant of the A.C., neither am I paid to write this, but am a delighted owner of one.

H. J. BEANEY.

### Sidecaring in Demerara.

Sir,—I enclose a photograph of my  $3\frac{1}{2}$  h.p. Norton (Millennium two-speed hub gear) and sidecar which I thought might interest your readers, as it comes from a place very little heard of.

The number of motor cycles here is increasing by degrees, though I doubt if two years ago there were more than a dozen altogether.

The roads are terrible, and tyres give more trouble than all the other things put together.

My mount is exceedingly useful for going shooting, as plenty of birds abound on our sea coasts, which make very good eating.

W. H. COLLIER.

Georgetown, Demerara.

Sidecaring in Demerara. Photograph accompanying W. H. Collier's letter.

### A Tip for Removing Cylinders.

Sir,—Perhaps the following may prove useful to some of your readers who find difficulty in removing the nuts holding the cylinder to the crank case. The top half only of the nuts are filed down to fit a smaller box spanner. The nuts retain their full depth and number of threads. I have done this to my Triumph, and removing these nuts is now a pleasure when taking down the cylinder for removing deposit.

ECYOB.

Deccan (India).

### Motor Cycle Taxation.

Sir,—The report of the Committee on above comes as a thunderclap to such as I. At the end of last year, I bought, second-hand, a 1909 twin Rex triear 76 mm. bore at about 25% of its original cost, but to make it of any use I had to spend more than its original cost to me to fit it for the road.

Now that it is in perfect running order, I am faced with an increase of tax to £3 3s. No doubt my position is similar to many others. I purchased the machine to take my wife and child out on Sundays (I being at work all the week and my wife in business), and, during the summer, I had managed to get in a few evenings as well before dark.

I find, on looking up my record of runs, that I have covered about 1,540 miles since May 25th, 1912, and for that distance I have paid, in the form of a tax, £1 local taxation, 5s. driving licence, and petrol tax on forty gallons 10s., working out to about 4d. per mile, to be allowed to get out in the fresh air. Can the suggested alteration of tax be considered justified, when even the present one hits me, and a great many others, so hard, more especially owners of passenger machines, nearly all of which will come under the increased taxes if the suggestion be followed?

I, for one, most strongly protest against the proposed alteration, and think that some strong action by the trade association and by the A.C.U. (of which I am a touring member) should be made, otherwise I am afraid many of us will have to drop out of a very enjoyable pastime.

M. COOPER.

Sir,—Many persons have bought an old twin engined triear, as I have done, to give my wife and children an opportunity of enjoying the country, and run, perhaps, less than two thousand miles in a year. First cost was perhaps £20 to £25, and annual expense, including £1 licence, averages £4 to £5. A three-guinea tax is obviously most unfair, and in some years would equal or exceed the total of all other expenses. The very advantage of a motor as compared with a horsed vehicle—that of being able to cut down expenses by very moderate usage—is lost if there is a fixed charge of £3 3s. to start with. Is not the tax on petrol sufficient, coupled with a small tax on the vehicle? The pleasure is then taxed in proportion to the amount it is indulged in. Cannot the Committee see that heavy fixed taxes press heavily on people of small means, but are as nothing to the well-to-do leisured people who travel perhaps 20,000 miles in a year by motor?

J.T.J.

Sir,—What further injustices are we poor motor cyclists to suffer at the hands of a Government who are evidently out for blood? Where have the R.A.C. and A.A. and M.U. delegates got their information that motor cyclists will not object to an increase of taxation? Because we, as lambs, paid, smiled, and tried to look pleasant when more than 33% increased taxation was demanded, shall we now be further taxed on a hypothetical horse-power given by an unpractical formula? No, sir, if pay we must, let us at least have the satisfaction of knowing that our own live representatives have done their best to instil a little common-sense regarding motor cycles into the minds of those in authority. Further, let us agitate for better treatment in the way of making our Local Taxation licence available for the full twelve months from date of payment, and not, as hitherto, to the end of the financial year. Cannot someone suggest to the authoritative ones, if further taxation is demanded, that an increase of duty on petrol would be less obnoxious than an increase of direct taxation? Then one would pay in proportion to one's use of the machine and its actual horse-power.

MOTOR WALLAH.

Sir,—May I beg a small space in your valuable paper to urge all motor cyclists to protest against the proposed new taxes by signing the petition issued in last week's *Motor Cycle*? I am quite sure that motor cyclists as a body are sufficiently organised to bring about some moderation in the excessive taxes proposed.

The Surrey M.C.C. is prepared, if you will send it forms, to place a few in the hands of members in each town in the county where it has members, and I am sure getting the signatures would be an easy matter.

If all clubs would undertake to do the same, the trouble that you, Mr. Editor, have taken in drafting the petition would, I am sure, not be in vain.

EDWARD COX,  
Chairman Surrey Motor Cycle Club.

[A further supply of petition forms have been forwarded.—Ed.]

Sir,—Together with some thousands, I thank you for your endeavour to mitigate the threatened addition to the already extortionate tax upon the motor cycle. I may say for the south-west of Scotland that the motor cycle, with and without the sidecarriage, and the tricar is all over the comparatively poor man's mount, and that, more for business than for pleasure. Doctors here all use cars; but vets., Inland Revenue officers, commercial travellers, engineers, plumbers, artists, and a lot of farmers use the motor cycle daily, and it is only the high tax and price of petrol which prevent dozens of artisans from using motors. I have sent letter to our M.P., but it appears to me that the whole proceedings in the House of Commons are run by one or two who hate motors, and have an eye for nothing in particular but to haul in money by badly thought out taxation.

I trust your ever ready hand to the plough in this matter will be a success.

J. COPLAND.

Sir,—I have pleasure in signing and returning to you the petition against the proposed increase in the taxation of motor cycles. "Heaven knows" the upkeep or maintenance of the same is already sufficiently high. You will know that I am in an almost level country (Doncaster) with good roads, and at present the same are not ruined by heavy motor traffic owing to the Trent barring the way, yet my hand is always in my pocket for the machine.

BENJ. WEST.

Sir,—I enclose form with six signatures, including my own, and I must congratulate you on your enterprise in bringing out these forms, as I consider we motorists are taxed too highly already. I am also sending your suggested letter to our member for Bristol West, Col. Gibbs.

LAURANCE A. WESTON.

Sir,—I send petition form with names herewith. At the same time I have copied out the letter and forwarded to David Davies, Esq., and Col. Pryce Jones, our county and borough members.

JAS. A. SMITH.

Sir,—All motorists will support the A.C.U., A.A., and kindred associations, and also your petition in a combined effort to condemn any proposed increase to the already excessive taxation on motor cycles. If this committee is allowed to stand and shoot at us without a strenuous effort to protect ourselves, what is to prevent further demands next year, and so on *ad lib.* This does not seem possible, but it must be forgotten that the present Government is out to kill all sport, with motoring as a preliminary.

I am pleased to note the second-hand buyer is not being overlooked in this matter, as naturally the man whose only alternative is perhaps a three or four years old mount, and who must have power reserve for sidecar work or hilly country, or both, will be robbed of his healthy week-end pastime, because no sane person could suggest the majority who buy second-hand mounts can afford a £3 3s. tax. I am presuming a lightweight does not appeal to him, and, of course, for passenger work it need not be mentioned, neither can the popular  $3\frac{1}{2}$  h.p. be reckoned with without a speed gear, and this adds to the expense.

I trust all motor cyclists and cyclecar owners will also help to defend themselves individually by referring this question to their M.P., as suggested by your journal. The motor cycle clubs can also do their share in this direction.

AT 1097.

Sir,—Please find enclosed my signature against further taxation upon motor cycles. May I take the liberty of suggesting that the petition be further advertised. If you will kindly forward me some forms, I shall be pleased to distribute them amongst my friends.

F. J. LONDON.

Sir,—I return your petition form. I should like to endorse the letter signed R. Green in last week's issue of *The Motor Cycle*. To me it is a novel and sound suggestion, and it would make everyone pay in direct proportion to the cubic capacity of his engine, with only a slight variation for the skill in "tuning up."

A. COLLINSON.

[The above are but a selection of letters received from readers on the subject of the proposed new taxation of motor cycles, but they clearly show motor cyclists' views of the matter.—Ed.]

### Cyclecar Design.

Sir,—I am greatly interested in cyclecars and appreciate the efforts you are putting forth to popularise them in face of the opposition I believe exists in certain quarters. I believe they are destined to be extremely useful in the colonies, as you can sit in them when the roads make it impossible to ride a motor cycle. Another point I should like to mention is that if the track be made about three feet six inches, the cyclecar will ride between the ruts made by cars, waggons, etc., and will also run on the sleigh tracks in the winter.

A. H. RANDELL.

Moose Jaw Sash, Canada.

### Clutch Control.

Sir,—I am delighted to see "Ixion" is converted to handle-bar control for clutches. I changed the control on my Sturmey-Archer hub clutch from pedal to hand some months ago, and cannot conceive anyone going back to the foot control after using the hand. I used a lever sold by Bowden Wire, Ltd., with single point ratchet giving  $\frac{1}{2}$  in. pull, and at the hub end a pair of telescopic tubes as used for their magneto control. The standard Sturmey-Archer triple armed worm cup I replaced with a single armed cup with an adjusting screw in the centre. The arm is  $2\frac{1}{2}$  in. long to centre of shackle hole. With the  $\frac{1}{2}$  in. pull available, this releases and engages the clutch perfectly, and the hand lever works as easily as the exhaust valve lifter, which is on the same hand. The clutch can easily be disengaged with two fingers on the lever, and, in changing gear up, I grip both levers so that the engine cannot race and I get a perfectly clean change. The conversion cost me 16s. 6d. I made the new worm cup lever myself, and it is well worth it.

W. WOODWARD.

### SUMMARY OF CORRESPONDENCE.

"Flycatcher" writes that the waterproofing tip suggested by "Mudplugger" has not been successful in his case, and that the article has dried "tacky." Will "Mudplugger" oblige with a remedy?

"Inquirer" would like to ask "Mudplugger" what sort of linseed oil must be mixed with glue to make it waterproof.

The Eagle Motor Manufacturing Co., Ltd., London, write that the form of poppet valve cotter described and illustrated under the heading of "Patents," on page 1052, September 12th, has been fitted by them as standard for some years.

With regard to the paragraph "Amateur Police Traps and the C.T.C.," Mr. Burrows writes that while it is true that he occupies an honorary official position in the Manchester Centre of the C.T.C. in the matter of amateur police traps, he has an entirely free hand. We are glad to note that the C.T.C. is not officially responsible for this extremely silly idea, but at the same time we presume that Mr. Burrows will rely upon the help of the members. Of course it is within the right of any citizen to report flagrant cases to the police, and riders who drive to the danger of others deserve no sympathy. What we object to is the magnifying of a purely technical offence, already punished by penalties out of all proportion to the crime, and we should like to point out to Mr. Burrows and other busybodies of the same sort that there are many ways in which their energies could be better expended if, as he says, he is really desirous of assisting the law, but we suspect that his action has quite another motive.

# 100 Miles Open Reliability Trial.

## The Herts. County A.C. Third Quarterly Trial.

**T**HE start of this event, in which twenty-six riders took part, was from the Cricketers' Hotel, St. Albans, a small inn standing at the junction of the Wheathampstead and Luton roads. Getting there was not quite so easy as it sounds, as there was a dense fog, which rendered the early part of our journey from town most difficult, but fortunately it cleared off at Finchley. Also, to make matters worse, our carburetter frequently froze up, so that the inlet pipe had to be lagged in a rough and ready way to enable any progress to be made at all. However, at St. Albans the weather was glorious, and later it became much warmer. Newsome was riding a Triumph, which, beyond having a three-speed gear, was fitted with the Phillipson patent governor pulley we described recently. This pulley raises the gear automatically, and can be kept at any desired gear by pressing the heel on the exterior of the outer drum, which contains a spring keeping the movable flange against the belt. With this pulley there is no belt slip, even on a low gear.

Mr. Archibald Sharp, who examined the machines before the start, found that H. L. Meyer (Triumph) had only one brake, and in consequence disqualified him. Both weather and roads were perfect, and a splendid run was made to Luton, where we came upon W. Cooper filing his valve stems. Some miles further on at Barton-in-the-Clay we left the main road and entered some narrow lanes which led to Sundon Hill. Shortly before Barton was reached Newsome's cap blew off, and while stooping to pick it up he let his machine fall, but fortunately no damage was done. The lanes on the way to Sundon became very narrow and winding, and in many places were grass-grown. W. Cooper and several others were riding in a group, when they came upon a farm cart, the horse attached to which shied, pulled the cart into the ditch, and threw out the boy who was in charge. He rapidly got clear, chased the cart, and caught it up, just in time to speak words of comfort to the nervous quadruped as the others came by.

### Performances on Sundon Hill.

The foot of Sundon Hill was a control, and between this point and Aston Hill there was a secret check. Sundon Hill rises quite abruptly, has a fairly rough surface, and a gradient of about 1 in 8. The following made light work of the hill: Jarvis (Triumph), Collier (Zenith), Gutteridge (Rudge), Penny (A.J.S.), Cooper (Bradbury), Charlesworth (Zenith), Newsome (Triumph), Wills (Triumph), Bently (W.D.), Cooper (Enfield), Howe (Zenith), Meredith (Bradbury), Oliphant (Premier), Gold (Ariel), Newbold (Zenith), Lord (Rex), F. W. Applebee (Centaur), and Jacobs (Rex sc.)

AT THE START.

Mr. D. K. Hall, the timekeeper, despatching E. C. Jarvis (3½ h.p. Triumph).

Fordham (Quadrant) and Moss (Rex sc.) failed. The only cyclecar, Keiller's G.W.K., made an excellent ascent. We waited to see all the men tackle this, the first hill on the course, and then pushed on towards Kop Hill. The route was well marked, so it was quite easy to find one's way. Near Dunstable the surface was very bumpy, which caused our lamp bracket to give up the ghost, necessitating a most annoying delay, and rendering it impossible to include Aston Hill, the next severe gradient to be encountered in our journey, as otherwise Kop Hill would have been reached too late. Aston Hill is so well-known that it needs but a passing reference, while, beyond its rough surface and length, there is nothing to worry the modern machine. We pushed on quickly and caught up the vanguard about three miles from Prince's Risborough, where a sharp pitch with a church at the roadside took those who did not know the course by surprise. After Prince's Risborough, Kop—in an exceedingly loose state—up which steep acclivity Penny (A.J.S.), Cooper (Bradbury), and Charlesworth (Zenith) did really splendid performances. Bentley (W.D.), Walker (Hohart), Tippet (Humber), and Newsome (Triumph), excellent. Berwick (New Hudson), Wells (Triumph), Howe (Zenith), Lord (twin Rex), and Meredith (Bradbury) all made excellent ascents. Fordham (Quadrant) dismounted. The next interesting point on the course was the corner on Pink Hill, taken after the descent of Kop. Here Newbold (Zenith)

Geo. Baxter (Basil-Jap and sidecar) rounding the hairpin on Pink Hill.

R. Lord (6 h.p. Rex) on the steepest portion of Kop Hill. Both these ascents are in the neighbourhood of Prince's Risborough.

J. Chater Lea (Chater-Lea sidecar) climbing Sundon Hill. In the distance a sidecarist can be seen by the roadside.

was sent down to warn those at the foot to be careful, and, not taking sufficient care himself, collided with Keiller's G.W.K., damaging the radiator and putting the gallant little cyclecar out of action. Newbold then came up in front of Gold (Ariel), and, in taking the corner, fell in front of him. Gold had a narrow escape, but cleverly avoided a collision. It is assumed that the collision damaged Newbold's forks and upset his steering. From the foot of Kop Hill to Missenden was a non-stop section. As there were cattle on Pink Hill, five minutes were allowed to the competitors.

### The Slow Hill-climb.

A beautiful run through leafy woods, looking glorious in their autumn tints, brought us to Great Missenden, where lunch was served at the Buckingham Arms Hotel. Here we had an opportunity of looking round the machines. P. H. Bentley's W.D. had a remarkably clean crank case, and as the machine is fitted with forced lubrication this fact denotes great care in manufacture. Walker had a puncture, which was noticed in the hotel yard, and after this point he did not again put in an appearance. After lunch we pushed on to Maple Hill, taking Rectory Hill on the way, and negotiating a stiff climb out of Chesham. Maple Hill is

quite a stiff rise, and used to be the scene of early Herts Club hill-climbs. On Saturday it served for the slow hill-climbing test, and provided much that was of interest. Charlesworth (twin Zenith) made a remarkably slow ascent, as also did Newsome (Triumph), Jarvis (Triumph), Meredith (Bradbury), Jacobs (Rex sidette), and Bentley (W.D.). F. W. Applebee (Centaur) tried to travel too slowly and stopped, but made certain of the ascent on his next attempt, and came up at a good pace. Gold (Ariel) and Fordham (Quadrant) came up fast. After Maple Hill there were no difficulties till after the Dunstable control. But between this point and the village of Caddington there is a hill known as Shaul End, which took several of the men by surprise, among whom may be mentioned Jarvis (Triumph), Fordham (Quadrant), and F. W. Applebee (Centaur). Thereafter the run to St. Albans by the main road was quite easy.

### The Awards.

The following are the awards and performances:

#### CLASS A.—LIGHTWEIGHTS.

F. Cooper (2½ Enfield) ...	Silver Medal.
W. P. Tippet (2½ Humber) ...	Bronze Medal.

#### CLASS B.—SINGLE-CYLINDER MACHINES.

W. F. Newsome (3½ Triumph) ...	Gold Medal.
C. W. Meredith (3½ Bradbury) ...	Silver Medal.
W. Cooper (3½ Bradbury) ...	Bronze Medal.
H. Berwick (3½ New Hudson) ...	Bronze Medal.
P. H. Bentley (3½ W.D.) ...	Bronze Medal.

#### CLASS C.—TWIN.

R. Charlesworth (6 Zenith) ...	Silver Medal.
E. A. Colliver (6 Zenith) ...	Bronze Medal.

The silver cup for the best performance of a trade rider in the trial was awarded to W. F. Newsome (3½ Triumph), while the cup for the best performance of a private owner was awarded to R. Charlesworth (6 Zenith).

Non-stop runs were made by A. N. Gutteridge (3½ Rudge), A. R. Penny (2½ A.J.S.), A. R. Wells (3½ Triumph), C. Howe (3½ Zenith), J. Oliphant (3½ Premier), and A. H. Gold (3½ Ariel).

### A Few Failures.

E. C. Jarvis (3½ Triumph) failed at Shaul End, and had a sooted plug at Harpenden; W. P. Tippet (2½ Humber) complained of being baulked on Shaul End; H. A. Fordham (3½ Quadrant) failed on all the test hills; P. H. Newbold (6 Zenith) retired after his collision; R. Charlesworth (6 Zenith) was reported to have stopped and waited in the last non-stop section between Dunstable and the finish, as he was too early; W. A. Jacobs (6 Rex sidette) and G. Baxter (6 Basil-Jap) both took the wrong road in Dunstable, and went many miles out of their way, arriving very late; C. A. Moss (6 Rex sidette) failed on Sundon, and did not finish to time; J. H. Kerr (5-6 N.S.U.) was wrongly directed at Boxmoor, and arrived very late.

The judges were Messrs. Archibald Sharp, A.M.I.C.E., and F. G. Carter, while the timekeepers were Messrs. F. Straight and D. K. Hall. The organisation was good, and the course was well marked by arrows, reflecting great credit on the secretary, Mr. C. M. Down.

(1) W. Cooper (3½ Bradbury) and W. F. Newsome (3½ Triumph) passing through Luton. (2) Outside the control at Sundon, J. Oliphant (Premier), H. G. Dixon (New Hudson), R. Lord (Rex), and C. M. Keiller (G.W.K.). The competitor riding past is F. Cooper (2½ Enfield). (3) On the way to Dunstable.

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

Oct. 10th	...	6.18 p.m.
" 12th	...	6.13 "
" 14th	...	6.9 "
" 16th	...	6.4 "

## The Petition against the New Taxes.

The petition against the proposed new taxation for motor cycles is being taken up enthusiastically by motor cyclists. Shoals of forms duly signed are being returned to us by every post.

## The Premier and Motor Cycle Taxation.

A reader informs us that, on the arrival of the Prime Minister at Ladybank, on Saturday last, he sent him per "Express Post" a copy of the letter inserted in *The Motor Cycle* last week, and that he understands from an inside source that it was carefully perused by the right hon. gentleman. We look forward with some confidence to the result.

## F.N. 1913 Models.

Great secrecy is being observed regarding the new four-cylinder F.N. We hear, however, from an outside source that this machine will create a sensation when it arrives. It has mechanically-operated inlet valves worked on the overhead system, while the exhaust valves are on the opposite side. There is a sump in the crank case for oil, from which the latter is delivered by pump to the bearings. The finish of the machine will also be very different from the usual somewhat sombre appearance one has been accustomed to associate with the F.N.

## Amateur Motor Cyclists' Association.

A meeting has been called for the 16th inst., at 7.30 p.m., at the A.C.U. premises, 89, Pall Mall, S.W., to consider the formation of an Amateur Motor Cyclists' Association. Those responsible for the formation of this body ask us to make it clear that they are not attempting to define an amateur for the world at large, but intend to tackle the matter so far as motor cyclists who may desire to join are concerned.

Mr. C. C. Cooke, who has been calling upon club secretaries during the last six weeks, has collected a considerable amount of information respecting motor cyclists generally and their wants, and has come to the conclusion that reform in many ways is needed. The provisional committee have several schemes for first-class events in 1913, and have definite promises of support from many private owners throughout the country. This being the case, there will, of course, be no objection to one of four events being sporting tussle between amateur and de riders. The meeting on the 16th is open for all genuine private owners, and Mr. Cooke hopes they will turn up and give their support.

## Liverpool Open Hill-climb.

We are requested to state that by special request of the Auto Cycle Union, the open hill-climb arranged by the Liverpool Auto Cycle Club for the 12th inst. has been postponed until Saturday, the 19th inst. In the stopping and restarting test, competitors need not stay in the saddle. Should four or five ladies enter, a special class will be arranged with prizes equal to the other classes.

## A Belated Official Result.

Revised results of the Junior T.T. Race, organised by the British Motor Cycle Racing Club on September 14th, have just been issued officially. The only difference is as regards those who finished after the third man. The details are: 1, S. L. Bailey (Douglas), 2h 49m. 45s.; 2, Hugh Mason (Nutt-Jap), 3h. 0m. 35s.; 3, A. Woodman (Humber), 3h. 50m. 21s.; 4, S. W. Phillpott (Humber), 3h. 50m. 27s.; 5, F. A. McNab (Douglas), 3h. 52m. 25s.; 6, A. J. Jenkins (Douglas), 3h. 56m. 5s.

## SPECIAL FEATURES:

### PROPOSED NEW TAXATION.

Opposition to the recommendation.

### WEEK-END COMPETITIONS AT HOME AND ABROAD.

### SEVERAL NEW CYCLECARS (ILLUSTRATED).

## £100 Challenge.

As an outcome of a friendly argument between Mr. F. S. Whitworth, of the Colmore Depot, and Mr. G. H. Mansell, of Singer and Co., Ltd., as to the superiority of G. E. Stanley and S. L. Bailey as a motor cycle tuner and rider, a sporting match has been arranged with stakes of £100 a side. Both G. E. Stanley and S. L. Bailey are holders of world's records. The former will ride a Singer, and the one time Australian champion a 2½ h.p. Douglas. The simple conditions are as follows: Cylinder capacity limit 350 c.c. The events, which will be three in number, consist of a hill-climb, a five lap and a ten lap race on Brooklands. The hon. secretaries of the Sutton Coldfield A.C. the Coventry and

SINGLE  
VERSUS  
TWIN.

TWO WELL KNOWN RIDERS WHO ARE TO COMPETE FOR A STAKE OF £200.

S. L. Bailey (2½ h.p. Douglas).

G. E. Stanley (2½ h.p. Singer).

**THE LIMIT IN CYCLECARS!**

The Bedela cyclecar in the Gailion hill-climb. This machine is fitted with a 30 h.p. twin-cylinder engine (cylinders set at 90°) with double belt drive—one off each end of the engine-shaft direct to the rear wheels. The belt rim, it will be noticed, is only a trifle larger than the pulley itself.

Warwickshire M.C., Oxford M.C.C., and Mersey M.C. have been invited to form a committee with the editor of this journal and another.

**Scenes during the Dutch Trial.**

The suggestion having been made to us, we have arranged with one of *The Motor Cycle* photographers to prepare a series of copyright picture postcards of the first English-Dutch reliability trial at a charge of 2s. 6d. per dozen, and 3s. 6d. for a set of eighteen.

**A French Team for the London-Exeter Run.**

Our contemporary, *L'Aero*, in a prettily worded article, thanks British motor cyclists for their support in the recent French events, and proposes to return the compliment by organising a team of French motor cyclists to take part in the M.C.C. London-Exeter and back run at Christmas.

**Newsome's New Venture.**

W. F. Newsome (till lately the leading competition rider for the Triumph Cycle Co., Ltd.) and R. Fletcher (well-known as a Premier rider) are now settled in their new premises at 3, Sandringham Parade, Ealing, W., as motor cycle specialists, and have 1912 models of the Triumph, Douglas, Premier, A.J.S., Zenith, and Rudge in stock. Repair work is to be made a feature.

**No Cut-out Regulation Issued.**

We have been very much amused by seeing a statement elsewhere to the effect that a Local Government Board regulation prohibiting the use of cut-outs has been issued. As a matter of fact, no such regulation has been issued. What the Local Government Board has done is to issue a draft regulation, this draft having been submitted in confidence to the leading bodies for their consideration and opinions. To it amendments may quite likely be made, but for the time being it remains but a draft proposal. At the same time, while a draft regulation is not the real thing—though evidently some people imagine that it is—there is no doubt that cut-outs will be prohibited next year; indeed, this has been clear for some time, and all who have read our references to it will experience no surprise when a prohibitory regulation is eventually issued.

**One Armed Motor Cyclist.**

The fact that J. King, who recently won the Nottingham and District M.C.C. reliability trial of 100 miles, has only one arm shows that the riding and management of a motor cycle is neither a difficult nor dangerous occupation when due care is exercised.

**FUTURE EVENTS**

Oct.	12.—B.M.C.R.C. Race Meeting.
"	12.—Mersey M.C. Open Hill-climb on Pen-y-Ball.
"	19.—Liverpool A.C.C. Open Hill-climb.
"	26.—A.C.U. Autumn Open One Day Trial.
Nov.	2.—N. Middlesex M.C.C. Open Winter Reliability Trial.
"	8-16.—MOTOR CAR SHOW AT OLYMPIA.
"	25-30.—MOTOR CYCLE SHOW AT OLYMPIA.

**Proposed Amateur Police Traps.**

We continue to receive cuttings from the press about the proposed "National Road Guards," accompanied by letters from our readers, who, in many cases, express surprise that the C.T.C. is not officially cognisant of what is being done by the Manchester Centre. According to the *Daily News and Leader* it was stated

at the meeting that, in the event of convictions being obtained, half the fine went to the informer—pleasant term! This statement was regarded as a point of great importance. We are, however, glad to be able to assure our readers that there is no truth whatever in this statement, and that the amateur sleuth hounds will be disappointed of their guineas.

**Saturday's Meeting at Brooklands.**

For the B.M.C.R.C. meeting next Saturday, a record entry has been received. In the time trials there are sixty-four entries, one hour cyclecar race twelve entries, sidecar race sixteen entries, Junior one hour race sixteen entries, five-lap 1,000 c.c. race twenty-four entries, and 500 c.c. championship twenty-nine entries. Racing starts at 10 a.m.

**The 1913 T.T. Races.**

We gather from opinions expressed that the trade generally are in favour of supporting the Tourist Trophy Races next year. We understand that the matter has already been considered by the Motor Cycle Manufacturers' Union, and the recommendations that the trade generally support next year's T.T. have only to be confirmed by the council. This is good news, for it will mean that the 1913 T.T. Races will be thoroughly representative. A two-day race is under consideration for next year, the Junior and Senior machines to compete together.

**Imports of Motor Cycles.**

September imports of motor cycles totalled 45 of a value of £1,673. This is a decrease, but motor cycle parts imported show an extraordinary jump, viz., from £6,274 in September, 1911, to £14,866 this year, making the total £16,539. During the nine months ended September 30th, the imports of motor cycles and parts were as under:

1910.	1911.	1912.
£81,738	£87,859	£131,528

The great increase in imported parts entirely accounts for the rise in figures.

**British Exports.**

Our exports of motor cycles have, however, increased in far greater proportion. Last month 1,425 complete machines were sent abroad of a value of £57,352, or £76,398 with parts. During the nine months ended September 30th, British exports of motor cycles and parts are represented by the following values:

1910.	1911.	1912.
£106,656	£213,997	£477,740

## THE HUMBERETTE.

Features: Air-cooled V type engine, three-speed gear box, tubular frame, shaft drive.

IT may be said without fear of contradiction that no cyclecar has received such a severe and thorough testing before being placed on the market as the new Humberette. Eighteen months ago the first example was seen on the high road; it was a two-speed model, but in other respects the main features were the same as they are to-day, though, of course, sundry improvements and alterations have been made during the time the machine has been undergoing its many thousand miles road test.

What will undoubtedly appeal to the reader is the fact that the Humberette is a real cyclecar, embodying, as it does, most of the true characteristics of the motor cycle, viz., wire wheels, air-cooled engine of the V type, and tubular frame. It certainly has no chains or belts, but the shaft drive may be regarded as a distinct advantage, seeing that it is entirely weather-proof and likely to be more reliable.

### The Engine and Fittings.

The engine gives approximately 8 h.p., the bore and stroke being  $84 \times 90$  mm.; the cylinders are interchangeable and set at an angle of  $50^\circ$  to one another.

Recessed piston with two-step cut rings.

Rear spring bracket and spring torque rod.

Front view of the Humberette chassis, showing two-cylinder engine, position of magneto, tubular frame and transverse spring.

Three-quarter front view of the 1913 Humberette.

The carburetter, which is of new design with four jets opening one after the other, is neatly disposed between the cylinders. It is of the automatic type, and is known as Smith's patent. The clutch is of the leather to metal cone type, operated by three springs which are easily adjustable. An aluminium casting bolted to the engine base forms a neat housing for the clutch and gear box, and makes an exceedingly compact unit. The ratios are 4.46 to 1 on top, 7.87 on second, and 13.6 to 1 on first speed, the reverse being 18 to 1. The gear box is of the sliding tooth type, operated in usual car fashion by a lever working over a quadrant enclosed within the body. From the gear box the power is conveyed to a bevel differential in the back axle by a long shaft. The universal joint is at the rear end, a star joint being utilised at the gear box end.

Humberette adjustable tappet.

The frame is tubular, with two side and three cross members, and is supported at the front on a transverse spring, quarter elliptic springs being used at the rear. The front axle is of weldless steel tube. External brakes are used throughout, one acting on the gearshaft, the hand brake operating on the rear wheel hubs. All have milled nuts to provide rapid adjustment with the fingers. The rear wheels are detachable in a few minutes. A cotter pin is used to key the hub to the spindle in the same way as a crank is attached to the bottom bracket axle of a bicycle. The wheelbase of this miniature car is 7ft. 3in. and the track 3ft. 6in.

The magneto is in a most accessible position in front of the engine, the contact breaker facing forward. It is driven from the timing gear. The handle starter operates on the camshaft, thus giving two revolutions of the engine to one of the handle.

The control is by a throttle lever mounted on the steering pillar interconnected with an accelerator pedal,

Stuffing gland on the inlet pipe allowing for expansion

**The Humberette.**—

conveniently placed between the clutch and brake pedals.

A variable spark advance lever is provided in the centre of the steering wheel. The petrol and oil tanks are carried on the dash. The oiling arrangement is by sight drip feed, but a pump is provided.

The silencing of the vehicle is excellently carried out. Two pipes enter a large sized silencer placed amidships; the exhaust thereafter is conveyed to the rear of the car by another pipe.

Good tool accommodation is provided, and the 1913 Humberette will be sold complete with hood, screen, lamps, and horn. Leather side extensions are fitted to the mudguards and running boards. We examined examples of the Humberette finished in green and French grey, and in the latter finish the vehicle looked particularly imposing. A dummy radiator is used which certainly enhances its appearance.

We subsequently tried the machine on the road, and what impressed us more than anything else was

Rear view of power unit, from which will be seen the control arrangement, also the clutch housing and three-speed gear-box.

Broadside view of the 1913 Humberette, which is to be sold complete with hood, screen, lamp, and horn.

the efficiency of the springing. We purposely selected a pot-hole road which is avoided by all Midland motorists, and we were astonished at the degree of comfort. The engine is possessed of ample power

for all ordinary requirements, and, we understand, will attain a speed of over 40 m.p.h. It will slow down to about 10 m.p.h. on the same gear without the engine knocking or showing signs of distress. The rack and pinion steering is neat, and we found it light and simple to handle.

As we have already pointed out, the Humberette is not an untried machine. The makers had such confidence in their production that 500 were put in hand some months ago. We have actually seen piles of frames, cylinders, gear boxes, and axles in the various finishing shops. The reception of the vehicle on the occasion of its first inspection by Humber agents was such that 500 more were at once put in hand, and deliveries will be commenced at the end of this month. There seems to be no doubt about the success of the Humberette.

**THE HUMBERETTE ON THE ROAD.**

At Finham Bridge on the way to Stoneleigh.

In the gateway of Kenilworth Castle.

## THE GAILLON HILL-CLIMB.

Rex Mundy  
(3½ Rudge)  
at full speed  
in the Gaillon  
hill-climb,  
France, on  
Sunday last.  
He was beaten  
by 2s. by A. J.  
Dixon (3½  
Singer).

THIS is the fourteenth year that the above event has been held on the famous hill at Sainte Barbe, between Paris and Rouen. The hill is not steep nor tortuous, and the average gradient does not exceed 1 in 10. Messrs. Douglas, Bashall, and Mundy agreed with us that it was not a hill-climb at all. The first thing we noticed on arrival was that an enterprising proprietor of a shooting gallery in the village had converted his tent into a motor cycle garage. The hill was well guarded, a wire fence being erected along one side, and behind this the spectators were supposed to take their stand. There was a fair crowd on the hill, and racing started at 1 p.m., or thirteen o'clock as the up-to-date French papers have it. The organisation generally was good, but there were apparently no regulations for the motor cycles, with the result that the majority of the French competitors turned up on stripped machines, and were thus at an advantage. The Britishers, on the contrary, rode with full touring equipment, but Mundy removed the mudguards of his Rudge when he discovered that petrol tanks of the dimensions of a 1 lb. carbide tin were permissible. The car results were decided on formula and speed, but the motor cyclists had to be satisfied with speed positions only.

Very few motor cyclists carried numbers; in fact, we only saw three or four, and they were on British machines, but wait, one Frenchman made amends for the rest for he carried a number on his back (not 13) about 2ft. square; he did not intend his friends to miss his ascent or mistake him for anyone else.

#### Success of a stripped Racer.

The Motosacoche in the 350 class was an absolute racer, pedal cycle tyres, overhead valves, no exhaust pipe—in fact, one could see the valve through the port. Under the circumstances, it is not surprising that it won fairly comfortably from the Terrot and Douglas. We do not write this in any spirit of jealousy, but we do really think that the organisers should see that all compete on equal terms. A rule to the effect that equipment was not restricted would have saved a lot of trouble and expense to the Britishers.

Of the ascents in the various classes, an Alcyon ridden by Soly or Stoffel, Terrot III., Dixon's 3½ Singer, W. Douglas's Douglas, Rex Mundy's Rudge, and De Vay's Triumph went up fastest.

Several English riders who had entered were absent, notably F. W. Barnes, who had entered three Zeniths in three classes, but failed to put in an appearance. Cocker was absent, and Rockwell (a relation of Bashall's), who would have made the third Douglas, was prevented from crossing by reason of illness in his family. Scott (Rudge) was present, but did not get placed.

The Austral ridden by Dacier is fitted with a four valve Alcyon engine, no exhaust pipes, and was seen in the Isle of Man.

Fenton's Clément is an Enfield motor cycle with a Motosacoche engine. That old veteran, Rivière, had entered with a Mototri Contal, but did not compete; he does not look a day older. Bourbeau's Bedelia and the Automobilette represented the cyclecars. Both climbed well, but would certainly have been beaten for speed by Barnes's Zenith and sidecar had he turned up.

#### A Monstrous Cyclecar.

One of the features of the meeting was a 30 h.p. Bedelia, which competed in the 2 litres 700 to 3 litres racing car class. The engine is a 90° twin of about 120 mm. bore, and the drive is by two ordinary 7in. leather belts direct from each end of the engine-shaft to the rear wheels. The wheelbase is 11 feet roughly measured by paces, and the body, which is of streamline design, has seating for one. To see the belts flapping as this monster went up the hill caused a knot of British spectators to give vent to exclamations of surprise. A photograph of this strange machine appears on the previous page.

Journeying to Paris in the train at dusk, we could see a trail of dust which hung over the road, showing the passage of competitors and spectators returning to Paris by road. Results:

L. Mogridge (3½ h.p. Mean-Precision) near the top.

H. Reed (8 h.p. Dot-Jap) on the first bend.

**P**EN-Y-BALL, Holywell, Flintshire, was the scene of another hill-climb on Saturday last, the Manchester M.C. being the organisers on this occasion. The police and citizens of Holywell are of sporting dispositions and received the motor cyclists with open arms, and one could have imagined oneself at Douglas during the Tourist Trophy races, so numerous were the riders to be seen in the streets.

The hill rises abruptly from the centre of the town with a reputed average gradient of 1 in 6, the course covered being about three-quarters of a mile. The surface has been greatly improved since the Mersey M.C. held a similar event there two months ago.

The somewhat twisty nature of the course did not bother the riders with the exception of H. Taylor (Bradbury), who came off at the first bend. Several surprises were caused, one being the defeat of H. Reed, but it is only fair to state that he got a very bad start.

A real lightweight. The 2½ h.p. Hobart, ridden by J. Dudley, the rider on the left, made a good climb. This machine scaled about 100 lbs.

On time the results were:

**CLASS I.**—Standard Touring Lightweights up to 350 c.c.  
Maximum weight limit, 140 lbs.

1. F. S. Whitworth (2½ Colmore-Douglas) ... 53½s.
2. S. W. Phillpott (2½ Humber) ... 1m. 16s.
3. H. C. Newman (2½ Ivy-Precision) ... 1m. 25½s.

**CLASS II.**—Standard Touring Machines up to 600 c.c.  
Maximum weight limit, 200 lbs.

1. V. E. Horsman (3½ Singer) ... 49½s.
2. H. Gibson (3½ Bradbury) ... 52½s.
3. F. S. Whitworth (2½ Colmore-Douglas) ... 56s.

**CLASS III.**—Unlimited.

1. J. J. Cookson (8 Matchless-Jap) ... 42s.
2. H. Marsden (7-9 Matchless-Jap) ... 44½s.
3. H. Reed (8 Dot) ... 46½s.

**CLASS IV.**—Racing Machines up to 600 c.c.

1. E. V. Horsman (3½ Singer) ... 48½s.
2. K. H. Clark (3½ Corah) ... 48½s.
3. H. Eardley (3½ Premier) ... 50s.

**CLASS V.**—Touring Cyclecars and Sidecars.

1. F. Shaw (8 Zenith-Jap) ... 1m. 5s.
2. E. Longden (8 Dot) ... 1m. 22½s.
3. A. W. Montgomery (8 Morgan) ... 1m. 28½s.

**FORMULA RESULTS.**

**CLASS I.**

1. F. S. Whitworth (2½ Colmore-Douglas).
2. S. W. Phillpott (2½ Humber).
3. H. C. Newman (2½ Ivy-Precision).

**CLASS II.**

1. V. E. Horsman (3½ Singer).
2. F. S. Whitworth (2½ Douglas).
3. J. Dudley (2½ Hobart).

**CLASS III.**

1. F. S. Whitworth (2½ Douglas).
2. H. Eardley (3½ Premier).
3. W. G. McMinnies (3½ Triumph).

**CLASS IV.**

1. V. E. Horsman (3½ Singer).
2. H. Eardley (3½ Premier).
3. F. S. Whitworth (2½ Douglas).

**CLASS V.**

1. H. Gibson (3½ Bradbury).
2. F. Shaw (8 Zenith-Jap).
3. E. Longden (8 Dot).

## RECORDS AT BROOKLANDS.

At the start of G. E. Stanley's attempt on the one hour single-cylinder record. In the picture may be noticed S. L. Bailey (on the left), Harry Long, H. V. Colver, and G. Cocker.

We heard late on Wednesday evening (Oct. 2nd) that G. E. Stanley was to make an attempt on the hour record on a  $3\frac{1}{2}$  h.p. Singer on the following day. The weather, however, though beautifully fine was very windy; in fact, so much so that Stanley postponed his attempt until 5.30 in the evening. This was much too late, and after a magnificent performance in which he kept inside record the whole time, he had to give up, as it was too dark to see. The first lap, from standing start, was covered at a speed of 65.05 miles an hour. His first twelve laps were covered at an average speed of 69.75 miles an hour, while several laps were covered at 69.98 m.p.h. In the

sixth lap he slowed up slightly, owing to the oil not going through properly and reduced his speed to 63.44 m.p.h. Save for this, his average speed throughout was well over 69 m.p.h. It was exactly a year ago that Stanhope Spencer went for the hour record, in which he also beat the fifty miles, covering that distance in 45m. 34.24s. Stanley, however, easily beat the latter record by covering the distance in 43m. 40s. and at an average speed of 68.70 m.p.h. During the afternoon Harry Long on his Singer sidecar combination went for a trial run on the track at the end of his long distance ride, and succeeded in doing his best lap at a speed of 37.63

m.p.n. This was due to the engine having a very low compression. At five o'clock in the afternoon, S. L. Bailey (Douglas) went for the five miles record, which he succeeded in beating. His time for the distance was 4m. 51 $\frac{1}{2}$ s., an average speed of 61.81 m.p.h. The previous best was by Harry Martin, who, on the 17th May, 1911, covered the distance in 5m. 1.2s., riding a one-cylinder Martin-Jap, 76 x 59.5 mm., 270 c.c.

Stanley again went for record on Saturday, and covered five miles in 4m. 14.4s. This gives a speed of 70.75 m.p.h., and beats the previous records in both Class C, held by Stanhope Spencer (Rudge), of 4m. 33.6s., and Class D, held by S. T. Tessier (Bat-Jap), 76 x 64, 580 c.c., of 4m. 18.4s.

## BELT FASTENERS.

The latest Dall belt fastener is illustrated herewith, and it should be noted that steel liners, which formed a feature of this fastener, have now been discarded, as the swivel necks take all the wear. The connecting links are made from high tensile steel, such as is used for motor cycle chains. This steel has a breaking strain of 15 tons to the inch.

The method of securing the belt by bolts from underneath and nuts on the top, instead of tapping the bottom plate of the fastener, enables a much lower gear to be used without damaging the threads of an adjustable pulley. There are no hook ends, yet it is extremely easy to attach or disconnect the fastener.

## NEW PREMIER TWIN ENGINE.

The Premier Co., of Coventry, have produced a 7-9 h.p. twin-cylinder engine for cyclecar work and for heavy sidecar combinations.

7-9 h.p. twin Premier engine.

The engine has a bore and stroke of 85 mm. x 88 mm. respectively; in fact, the cylinders are identical with those of the  $3\frac{1}{2}$  h.p. model, but without auxiliary exhaust ports. The connecting rods are fitted with large big end bearings, which work on a common crank pin. Extremely heavy flywheels have been fitted to ensure slow running, their diameter being 225 mm., or approximately 9 $\frac{1}{8}$  in. The timing gear is similar to that used on the  $3\frac{1}{2}$  h.p. twin, but the new engine has a chain-driven magneto. Adjustable tappets are fitted to all valves. Flanges are bolted to inlet and exhaust ports, and these hold their respective pipes by a clip action. This is a particularly good point in respect of the inlet pipe, as it renders it a simple job to make an air-tight joint. On the driving side the crankshaft is driven into the centre of the flywheel, and fastened to it by three rivets passing through a flange made with the shaft and a corresponding boss on the flywheel. The engine should be a great success for passenger work, and

will form the power unit of the new Premier cyclecar.

The timing gear cover removed.

## 1913 Model Baby Peugeot.

A NEW cyclecar which will shortly make its appearance in this country is one produced by the renowned firm of Lion-Peugeot, of Beaulieu, Doubs, and to be known as the Baby Peugeot. This firm has had a long experience in the manufacture of motor cycles and cars of all sizes—old pattern Peugeot light cars are running to this day—consequently the design adopted by the firm for a two-seater car of the lightest possible type will be studied with interest.

The engine is a four-cylinder with monobloc cylinder casting, the bore and stroke being 55 x 90 mm., giving a capacity of 856 c.c. The valves are mechanically operated, the inlets being arranged on one side and the exhaust valves on the opposite side of the engine. The carburetter and magneto—which is the ignition solely relied upon—are arranged in line on the off side of the vehicle. The carburetter unions are neat and accessible, as will be gathered from our illustration of the power unit, one branch feeding each pair of cylinders, as in standard car practice.

Water-cooling has been adopted, the gilled type radiator fitted in front being very slightly wedge shaped. The bonnet is of D shape and has louvers cut in the sides.

**The Frame and Body.**

The frame is of channel steel, and suspended on semi-elliptical springs. All control and brake levers are enclosed within the body. Steering is by worm and sector. No running boards are provided, but the mudguards are of ample width, the front guards having inside extensions. The body is of clean design, the high scuttle dash under which the fuel tank is fitted giving the car a compact appearance. We understand that this car complete with hood and screen

Showing the power unit, position of magneto and carburetter, and the water-cooled engine which has enclosed valves.

and lamps will be marketed for 1913 in the neighbourhood of £100. There is no example of this entirely new model in this country at present, but it is almost certain to be exhibited at Olympia, where it is sure to attract a considerable amount of attention.

**THE BOSCH WATER PROOF MAGNETO.**

We would again impress upon our readers the importance of fitting the high-tension wire to this type of magneto machine as directed by the makers.

Previous to describing how this should be done, a word or two of explanation is necessary. The ebonite recess from which the wire protrudes is a *cul-de-sac*, and water cannot leak through to the interior of the machine. It is, however, possible that in continuous rain, the recess may, if the wire is not fitted properly, become choked with wet and grit. When this happens, and the cable is externally wet, the current can leak from the terminal to the cable, and thence across the wet ebonite edge of the portion which fits against the end plates to the metallic plate itself. Now to obviate this chance altogether, firstly a wire of the correct size should be selected, and next the recess should be filled with melted paraffin wax (any sort of wax will do). Now the cable with the wire cut off flush with the end should be inserted and the screw at the back of the recess screwed up home through the cable and the interior wire to the terminal. A perfectly satisfactory joint is now made. The Bosch Co. will do it for those who do not care to undertake the job themselves. The Bosch Co. feel perfectly confident that, if their instructions be carried out, none of the troubles of which we have heard lately would be experienced. If is, of course, absolutely fatal if a stoppage occurs in wet weather to remove the end plate, as immediately wet enters the interior of the magneto matters are made much worse.

One of the cups to be presented by the Bosch Magneto Co., for competition during the 1913 season, among private owner members of motor cycle clubs.

The Baby Peugeot for 1913, a four-cylinder engine vehicle of 55 x 90 mm.

# CLUB NEWS

## Coventry and Warwickshire M.C.

The closing run and speed-judging contest will be held next Saturday, meeting at Wellesbourne at 2.45 p.m. prompt. Three prizes are offered. If five cyclecar drivers enter a fourth prize will be given.

## Burnley A.C.

The inter-club hill-climb v. Nelson M.C.C., held at Barby Hill, in ideal weather, resulted in an easy win for the Burnley club, which won five events to one win by the Nelson club. One event was won by a lady member.

## Northamptonshire M.C.C.

On the 5th inst. the members held their last competition of the year on Dodington Hill. It took the form of a flexibility hill-climb for the president's prize. The results were as follows: 1, C. T. Underwood (Bradbury); 2, W. Lees (T.T. Triumph); 3, C. J. Peck (Triumph).

## Hertfordshire M.C.C.

The articles of association have been issued. The membership, with the exception of a certain number of founder members, the list of whom is now complete, is confined to residents in Hertfordshire or within ten miles of its boundaries. The hon. sec. is Mr. F. E. Woods, 16, Eastcheap, London, E.C.

## Walthamstow M.C.

The above club held a team trial over a sporting course of sixty miles, with the following results: Winning Team—D. Fairhead (7 h.p. Indian and sidecar), T. Danaher (4 h.p. Indian and sidecar), and W. S. Low (3½ Scott and sidecar).

A 200 hundred miles reliability trial to Norwich and back was held on the 28th ult., with the following result: 1, A. E. Uffelman (6 h.p. Rex-Jap), silver cup.

## Nottingham and District M.C.C.

A reliability trial of one hundred miles was held on Saturday, the 28th ult., over a very hilly course, to Kettering and back, *via* Melton Mowbray, Oakham, Uppingham, and Rockingham. Fifty marks were deducted for failure to climb the observed test hills, and one mark was deducted for each minute lost or gained in controls. Results:

Rider and Machine.	Possible 500.	Marks gained.
1. J. King (2½ Premier) ...	500.	...
2. J. D. Mitchell (3½ Rover) ...	498.45	...
3. F. Welsh (2½ Humber) ...	498.15	...
4. G. Brough (6 Brough) ...	498	...
5. N. D. Soresby (3½ L.M.C.) ...	496.35	...
6. H. Dawson (3½ Bradbury) ...	496.30	...

## Brecon and Radnor M.C.C.

A hill-climb was held at Tumbledown Dick on the 2nd inst. Results:

### CLASS B (single gear machines up to 500 c.c.)

	Fig. of merit.
1. F. Phillips (3½ Rudge) ...	29.01
2. C. Nott (3½ Humber) ...	30.06
3. G. T. Jones (3½ Rudge) ...	32.46

### CLASS C (single gear machines up to 610 c.c.)

1. F. Phillips (3½ Rudge) ...	28.52
2. G. T. Jones (3½ Rudge) ...	31.15
3. C. Nott (3½ Humber) ...	32.84

### CLASS H (machines with one or more speeds; open).

1. H. Jones (3½ New Hudson) ...	36.04
2. C. Wild (6 Matchless) ...	41.46

### CLASS K (open to all comers).

1. T. Lloyd (3½ B.S.A.) ...	29.99
2. G. T. Jones (3½ Rudge) ...	31.15
3. C. Wild (6 Matchless) ...	45.41

Fastest time of the day.—C. Wild (6 Matchless).

## Canterbury and District M.C.C.

A hill-climb was held at Barn Hill, Wye, on the 26th ult., a hill about 700 yards long, with a maximum gradient of

1 in 6½. The formula in Classes I., II., and V. was

$$C \times T^2$$

as recommended by *The Motor Cycle*. T.T. machines penalised + 3s.; dropped handle-bars 1½s. Results:

CLASS I.—Any type of machine, including Pavillet Cup Competition.

Rider and machine.	Time in secs.	Result on formula.	Place
A. Baker White (3½ T.T. Rudge) ...	X + 10.3 + 3	373	1
G. Crump (3½ Rudge) ...	X + 13.2	371	2
S. D. Timson (3½ T.T. Rudge) ...	X + 14.3	314	3

CLASS II.—Any type of machine for members who have never won a prize in a fast hill-climb.

A. Baker White (3½ T.T. Rudge) ...	X + 10.3 + 3	373	1
L. Rumens (3½ Singer) ...	X + 18.8	327	2
T. Finn (3½ Premier) ...	X + 25.1	246	3

CLASS IV.—Speed-judging contest, standard time, 70s.

T. Finn (3½ Premier) ...	+ 38	...	1
G. Poxon (3½ Bradbury) ...	+ 37	...	2
L. Rumens (3½ Singer) ...	+ 46	...	3

CLASS III.—Club Sealed Handicap.

A twin-cylinder chain-driven Motosacoche of 6 h.p. Some details of this new mount are given on page 1142.

Members of the Manawatu-Feilding (N. Z.) M.C.C. who took part in the recent hill-climb held on Brickfield Hill.

#### Cambridgeshire M.C.C.

A novelty competition was held on the 26th ult. at Arrington. There was a large entry of members, and many of the tasks imposed were most amusing. An unexpected incident was the sudden appearance of the local policeman, who demanded to see everyone's licence. The prize winners were: 1 B. L. Peters, 2 H. J. Wallis, and 3 P. W. Cowell, all riding Rovers.

#### Cathcart District M.C.C.

A twelve hours' reliability trial was held on the 30th ult. The weather conditions were very bad, there being a heavy gale of wind and rain almost from start to finish. The competitors left Cathcart, Glasgow, at 8 a.m., *via* Abington, Lockerbie, Gretna, to Carlisle. Out of ten starters only six arrived in time at Carlisle. Only James Spence (9 Zenith sc.), G. W. Orr ( $3\frac{1}{2}$  Ariel), and J. E. Chisholm ( $3\frac{1}{2}$  Ariel) arrived home to time. Several competitors lost their way and were considerably delayed owing to the extremely dark night.

#### Hamilton and District M.C.C.

The club held a successful reliability trial on the 18th ult. under very severe conditions, and over a course of thirty-six miles, including two bad hills. All toolbags were sealed. The only accessories allowed were a repair outfit and two tyre levers. Those who finished the whole course in schedule time were: J. Low ( $3\frac{1}{2}$  Rudge), D. Fotheringham ( $3\frac{1}{2}$  Bradbury), J. Currie ( $3\frac{1}{2}$  J.A.P.), J. Sword ( $3\frac{1}{2}$  Singer), G. Copland ( $3\frac{1}{2}$  Triumph), W. Johnston ( $3\frac{1}{2}$  Bradbury), and R. Mc A. Walker (6 A.J.S.). The first award was a gold medal presented by Mr. J. Ledley. Hamilton.

#### The Motor Cycling Club.

The annual dinner and presentation of prizes will be held at the Adelaide Gallery on December 7th. There are nine cups and one hundred and seventy-six gold medals, forty-two silver medals, and nine bronze medals to be distributed. R. Croucher and S. T. Tessier have won four prizes each.

#### Sutton Coldfield and Mid-Warwickshire A.C.

The above club held their annual petrol consumption test on Saturday, September 28th. The route was from Sutton Coldfield to Lichfield and back, this course being covered twice, the distance in all being thirty-two miles. The awards were made on formula, an additional gold medal being awarded to the member averaging the greatest number of miles per gallon, irrespective of size or weight of machine.

$C \times W$

The formula used was  $\frac{C \times W}{P}$ . The route was practically

Petrol

devoid of hills, but there was a gusty wind. The gold medal was won by H. Newey, riding a  $2\frac{1}{2}$  h.p. Levis, whose consumption averaged 190 m.p.g. The results are as follows:

Rider and machine.	Formula.	Mileage to gallon.
CYCLES.		
J. L. Norton (4 Norton) ...	6770	135
Seymour Smith ( $3\frac{1}{2}$ Norton) ...	4571	138
F. W. Finnemore ( $3\frac{1}{2}$ Triumph) ...	4258	114
B. W. Lee ( $3\frac{1}{2}$ B.S.A.) ...	4254	128
SIDE CAR MACHINES.		
J. Woodhouse ( $4\frac{1}{2}$ Regal-Precision) ...	4996	68
P. Mosedale ( $3\frac{1}{2}$ Quadrant) ...	4079	64

A club meeting of the New Zealand Motor Cycle Club, whose headquarters are at Wellington. All machines appear to be of British make.

# THE WEST CYCLECAR.

Features : 8 h.p. air-cooled V type engine. Two-speed epicyclic gear. No differential.

Chassis of the 8 h.p. West cyclecar, showing general arrangement of parts.

A neatly designed cyclecar has just been built by Mr. E. J. West, of Coventry, who has had considerable experience in automobile construction, and

Front suspension of the West cyclecar on laminated springs

is a believer in the future of the light cyclecar. Last week we inspected the first machine made, and now publish explanatory photographs and sketches.

The engine is an 8 h.p. air-cooled Chater-Lea fitted with a large outside flywheel in which lies a leather-to-metal cone clutch. The power is transmitted through a universally jointed propeller-shaft to a bevel driven counter-shaft, on which is carried a simple two-speed epicyclic gear; thence to the solid rear axle by means of a single chain. The gears are operated by means of a side lever, a dog clutch serving to lock the gear solid to the shaft for the direct drive, while a rearward motion of the change-speed lever causes an external band to lock the low gear drum.

As mentioned above, the rear axle is solid and has no differential, but an ingenious slipping device is incorporated by means of which each rear wheel is driven through a friction plate, against which it is held by a powerful spring within the hub shell. The frame is of armoured wood, but the engine and gears are carried on a separate tubular under frame, and may be detached quite readily. The model we inspected was fitted with a Sthenos carburetter controlled by a

single lever on the steering wheel and an Eisemann magneto driven by chain from the crankshaft.

The steering is effected by a rack and pinion, and both axles are mounted on quarter elliptical springs.

The petrol and oil tank are carried in the scuttle dash, and the body, which was in an unfinished condition at the time of our visit, has flush sides and is carried out in a single curve on each side.

26x2½ mm. Continental tyres are fitted, and are held in place by wing nuts. The machine has been designed throughout so

Change speed lever of the new West cyclecar. The two notches are for neutral and top gears, the ratchet is to contract the low speed band.

as to give the maximum strength for its weight, and at the same time to be quite simple even for the amateur to erect, if the component parts are purchased. The brakes on the rear wheels are of the contracting type, and on the first model the low gear band serves as a counter-shaft brake, but in future an auxiliary counter-shaft brake will also be fitted.

The two-speed epicyclic gear and bevel boxes.

Design of universal joint.

The single short driving chain.

**An Oil Tank Idea.**

The oil tank A is provided with a diaphragm B, which can bend under pressure to force the oil along the pipe C when the tap D is open, a suitable air vent being provided.—H. and A. Dufaux et Cie., No. 6,442, 1912.

**The Canoelet Sidecar.**

The accompanying side and rear elevations illustrate the general lines of this sidecar, in which it is sought to enable the body to be arranged very low down. The longitudinal member consists of a single tube A bent round at the front, an upward extension being provided at the rear for attachment to the frame, as shown at B. The rear frame is bridged at C to pass over the wheel, the frame thus being supported on both sides of the wheel spindle. The suspension of the body by means of the leaf springs D and E is clearly shown.—F. W. Mead and T. W. Deakin, No. 21,045, 1911.

**A Tyre Repair Outfit.**

In this outfit the repair materials are cut to suitable sizes for single repairs, and the various elements are stored in receptacles so as to prevent damage.

Thus, tubes of solution A, patches B, rolls of canvas C, and tubes of French chalk D, each sufficient for a single repair, are carried, as illustrated, facilitating tyre repair.—M. J. Schulte, No. 23,738, 1911.

**A Two-speed Hub.**

The hub comprises two main parts AB, the former carrying the belt pulley or other power transmitter, and the latter being spoked to the wheel rim. Within the hub is mounted a planet pinion carrier C having pinions D engaging an internally-toothed ring E fixed to the member A. The pinions D rotate about a sun pinion F, which is provided with dogs G on either side, whereby it may be engaged either with the planet pinion carrier C or with a member H anchored to the frame by a bar J. Within the larger part of the hub shell B is an expanding clutch K, comprising a gun-metal cylinder and a steel sleeve, the latter having internal coned faces L

engaging corresponding faces on the planet pinion carrier and on a member M which may be operated by an arm N to expand the clutch K into frictional engagement with the interior of the hub B. In operation, when the sun pinion dogs G are moved into engagement with

the dogs on the planet pinion carrier, a solid drive is transmitted to the clutch K, and therefrom to the hub member B. On moving the sun pinion dogs out of engagement with the planet pinion carrier into engagement with the fixed member

H, the planet pinions are free to rotate on their spindles, and a reduced gear ratio is provided. The hub member B is provided with a free-wheel clutch O, whereby the engine may be started up without driving the machine, when the clutch K is out of engagement.—W. C. Pinson and W. R. Blaxley, No. 21,480, 1911.

**A Three-speed Hub.**

The belt pulley or other power transmitter is carried by a sleeve A, which is extended at B to form a wide internally toothed ring engaging planet pinions C D, rotating on spindles in a carrier E formed

**"The Motor Cycle" Photographs.**

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates: Unmounted prints, half plate, 1/6 post free; mounted, 1/9 post free. This refers only to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 10, Tudor Street, London, E.C.

on the driven sleeve F. This sleeve F carries a cone clutch member G engaging a corresponding member H fixed to the hub shell. The engagement is normally maintained by springs (not shown), but the member G may be withdrawn by the rod and pin J acting through the thrust bearing illustrated. The two sun pinions necessary to complete the epicyclic trains are shown at K and L and can be moved so that either is engaged with the dogs M on the fixed spindle. The sun pinion K is also provided with dogs N, whereby it may be locked to the planet pinion carrier E. When in this position the gear is solid and a direct drive is transmitted. To obtain the lower gears the sun pinions are moved into engagement with the dogs M on the fixed spindle, providing gear reductions corresponding to the proportions of the two trains. A

modified construction is described in the specification in which a double reduction can be obtained through both gear trains, providing a very low fourth speed.—M. Saunders, No. 15,343, 1911.

**A Driving Belt.**

This is a V belt in which the core comprises a central portion A of metallic canvas preferably folded into three layers as shown, and surrounded by ordinary canvas B, which is moulded into the belt C as usual. The metallic canvas comprises a fibrous warp and wire weft, and may be woven in strips of the requisite width, or cut from the piece.—H. W. Hassberger and A. Burnett, No. 940, 1912.

**A Back Rest.**

Secured to the saddle frame A are a pair of ears B which carry the pivot for the back rest support C to which the rest itself D is adjustably bolted. The support C may be moved into either a vertical or horizontal position and is locked by a slide E having a projecting tongue F which engages the ears B, and can be operated by hand, cable, or levers, as desired.—B. Brooks and H. Morrall, No. 26,194, 1911.

### An Interesting Presentation.

On the occasion of his marriage Mr. J. H. Slaughter was the recipient of a piano, subscribed for by his many friends in the motor cycle world.

### Birmingham to Carlisle and Back Run.

The winner of the P. J. Evans trophy in the Birmingham to Carlisle and back twenty-four hours' trial used a Senspray carburetter and Pedley belt.

### A Striking Success.

The winners of both Senior and Junior T.T. races at Brooklands rode machines fitted with a carburetter the patent rights of which have been acquired by the B.S.A. of Birmingham, who will shortly place it on the market.

### A Hobart Rider's Success.

At the Torbay and District M.C.C. hill-climb, Miss May Walker, riding a 2½ h.p. Hobart machine, was first on time and formula. Her time was 65½s., actually 7½s. faster than the next lady competitor.

### Calcium Carbide.

As readers may know, carbide is made in various qualities. Turco carbide is the outcome of much laboratory research, and is unaffected by air. The firm who manufacture it, Turco Ltd., Clayton, Manchester, guarantee a maximum gas yield per pound.

### South African Competitions.

The Excelsior trophy offered by the Rand M.C.C. for competition during the year has, we understand, been won by H. L. Weddell, riding a 3½ h.p. James. This is one of the most important competitions in South Africa, and has been run in three sections at intervals of three months. The results were based on hill-climbing and general reliability.

### Gold Medal Winners.

Two Monarch-Precision machines, ridden by E. Walker and V. Underhill, were represented in the Birmingham M.C.C. open twenty-four hours' trial to Carlisle and back, both gaining gold medals. It is interesting to know that these machines were fitted with Roc two-speed gears, and the riders reported at the finish that neither gear was touched during the whole run.

E. Walker and V. Underhill (3 Monarchs) who gained gold medals in the Birmingham to Carlisle-Birmingham Open Trial. Both machines are fitted with the Roc two-speed gear.

## SPARKLETS

### A New Tyre Firm.

The Burnett Motor Tyre Co., of Melksham, are opening new premises at the Valley Rubber Works, Limpley Stoke, near Bath. We understand the mill is being fitted with the latest machinery for the manufacture of the Burnett motor cycle and other tyres.

### "A Week in Waterproofs."

In addition to the firms mentioned in the issue of the 19th ult. as supplying a special kind of oilskin, the Service Co., Ltd., 292-293, High Holborn, W.C., write us that they not only supply the oilskins in question, but were among the first to announce this class of waterproof clothing for motor cyclists.

### A Unique Testimonial.

An advertisement in *The Times of India* for August 15th reads as follows: "The Triumph motor cycle is acknowledged to be the best machine made. 1908 models in stock, unique with improvements." The italics are ours. The correspondent who sends us this cutting says that the above is not a single misprint, but has been running for years. The Triumph Cycle Co. could not have a better testimonial.

### Anti-skidding Tyres.

The Skew non-skid motor cycle tyres are the production of Messrs. Oylers, Ltd., 35, New Cavendish Street, W. The tyres, we are informed, went through recent trials without a scratch and behaved most satisfactorily. Like the car tyres made by this firm, the motor cycle covers are cured under a pressure of threequarters of a ton, which brings about a thoroughly homogeneous cover, which does not cut readily and wears remarkably well.

### Irish End-to-end Record.

J. Stewart's Douglas on which he recently broke the Irish End-to-end Record was fitted with Hutchinson tyres.

The same make of tyres were used by Eric F. Remington, when he finished first in the last of the B.A.R.C. Races on the 28th ult. In a letter to the firm, Mr. Remington informs them that the front tyre has covered 4,500 miles on road and track, and the rear tyre about 1,500 miles—both are the ordinary beaded heavy ribbed pattern.

### Catalogues Received.

The illustrated advance sheet of motor cycle fittings made by the Bowden Brake Co., King's Road, Tyseley, Birmingham, has just reached us. This sheet illustrates Bowden controls, from the small single magneto lever to a control box for the steering wheel of a cyclecar. This control box has three levers, and is a neat method of controlling throttle, air and magneto in one fitting. It is attached to the centre of the steering wheel, and the levers come within easy reach of the driver's hand.

### Business Announcements.

We are informed that E. Folwell won the Leicester and District M.C.C. reliability trial held recently, and the high speed competition of the same club on Gaulois tyres.

H. H. Charge informs us that he has joined the depot staff of Rudge-Whitworth, Ltd., and is controlling their Leeds depot. He is well known throughout Yorkshire as an active rider.

The Car and Motor Sundries, Ltd., of which firm the managing director is Mr. W. T. Pritchard, has taken over the business of H. Martin and Co., Croydon, previously conducted by Harry Martin and S. R. Axford. The services of the two last mentioned well-known riders have been retained, and they will have full supervision of the works.

The style of the business of Godfrey and Applebee, Ltd., 208, Great Portland Street, W., has been slightly altered to cope with the expansion of trade, and in future the business will be divided into two distinct establishments. That of Godfrey and Applebee, Ltd., 87, Great Portland Street, W., will conduct the Scott agency, under the management of F. A. Applebee. Here a large and well-equipped workshop will be installed for handling any necessary repairs and tuning up this make of machine. The original business (dealing in new and second-hand machines) will be conducted by O. C. Godfrey, and will be known as Godfreys, Ltd., 208, Great Portland Street, W.

### The Manufacturers' Union Trophy.

The annexed illustration shows the Manufacturers' Union Trophy, specially designed by Messrs. Elkington, which is fifteen guineas in value. These trophies are offered by the Manufacturers' Union

for the encouragement of the sport and pastime, and are to be won outright. They are awarded at the discretion of the clubs promoting the events for the best performances of private owners.

"MABON" VARIABLE GEAR gives 8 speeds and free engine. Suitable for sidecar and so on work. Easily fitted to Triumph, Precision, Rudge, Single and Twin J.A.P. Belt always in tension. Large diameter of pulley for low gear. Simple and reliable.

PROMPT DELIVERY. PRICE 7 GUINEAS.

MABON MOTOR WORKS, High Rd., North Finchley, N.

MODEL S for motor Cycles.

In answering these advertisements it is desirable to mention "The Motor Cycle."

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

### SECTION II.

York and Lancashire.

### SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

### SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

### SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

### SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

### SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hafts, Channel Islands.

### SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

### SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

### SECTION X.

Scotland.

### SECTION XI.

Ireland and Isle of Man.

## IT WILL PAY YOU TO SEE

the great stock of newest models of every leading make, and the display of desirable bargains in slightly soiled and second-hand machines, and also to study the quite matchless low prices quoted at

**ALL-ROUND REDUCTIONS** are continued on nearly 300 stock machines, and most liberal exchange still for your present mount in part payment of a new one.

9, Shoe Lane,  
Fleet Street,  
LONDON, E.C.

'Phone: 5777 Holborn.

Wires:  
"Opifcer, London."

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under to the fee is rs. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hiffe & Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR BICYCLES FOR SALE.

**MOTOR BICYCLES FOR SALE.**

**1912 5½ h.p. T.T. Matchless**, new July do 60, £42;  
**1912 3½ h.p. T.T. B.S.A.**, brand new, £40—  
 Sharrock, 176, Bristol Rd., Birmingham. [X7297]  
**TRIUMPH**, 1910, Albion F.F. Jones speedometer, lamp, spare tube in case, and belt, new back cover; £32.—Goodwin, 68, Bristol St., Birmingham. [6314]  
**TRIUMPH**, late 1911 model T.T. 3½ h.p., Dunlop tyres, horn, head light, condition as new; bargain, £34.—Brown's, 12, Bull Ring, Birmingham. [X7314]  
**JAMES** Motor Cycle, 3½ h.p., T.T. model, 1911, here, lamp, accessories, spares, excellent condition. £30.—Kentish, 75, Trafalgar Rd., Moseley, Birmingham. [X7162]  
**TRIUMPH**, 1911, 3½ h.p., free engine, fitted with 1912 forks, very little used, and equal to new; £42.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0155]  
**TRIUMPH**, 1911, 3½ h.p., T.T. roadster, fast machine, in good condition; £30.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0156]  
**MATCHLESS** J.A.P., 1911, 3½ h.p., free engine, excellent condition; £35.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0157]  
**TRIUMPH** Motor Cycles—Latest 1912 free engine and T.T. roadster models in stock; buy your machine from the official agents for Birmingham and district.—The Premier Motor Co., Ltd., Aston Rd., Birmingham. [0158]  
**3½ h.p. Humber**, 1909, 2-speed, free engine, Whittle belt, engine just overhauled by makers, and new rigid sidcar; £30.—Gill, 32, Kimberley Rd., Rugby. [X7209]  
**NEW HUDSON**, 1912, 3½ h.p., 3-speed, Colonial model, first-class condition. Lucas lamp, horn, etc.; £45 nett.—23, Aubrey Rd., Small Heath, Birmingham. [X7466]  
**TRIUMPH**, 1909, just overhauled, new piston, splendid condition, good climber, lamp, spare belt, valve, tools, etc., good tyres. £25.—Stanford, 13, Much Park St., Coventry. [X7116]  
**2½ h.p. Motor Cycle**, Bosch mag., h.b.c., good tyres, 24 lamp horn, etc., complete, in good running condition; £12/10, or close offer.—Small, Lumsdown, Fast Kirby, Notts. [6402]  
**BRADBURY**, Sept., 1911, 2 speeds, Lucas lamp, horn, spare tube, Dunlop belt, new tyre. £30; Turner sidcar, head, screen, 29.—35, Regent Parade, Birmingham. [X7351]  
**DOUGLAS** E., 2-speed, free engine, footboards, Brooks saddle, absolutely perfect condition, very little used; what offers?—Cooper Harrison, Cotswold, Syston, Leicester. [X7373]  
**1909 Triumph**, good tyres, Palmer cord back, new Dunlop belt, new cyl. and other parts, 50/- Lucas lamp, 22 worth spares; £25, rare bargain.—Wykes, Rothley, Leicester. [X7365]  
**LATE 1911 5½ h.p. P. and M.**, perfect condition, run only 2,000 miles, practically new tyres, spare cover, lamp, horn, spares; £45.—Price-Hughes, 12, Little Church St., Rugby. [X7342]  
**2½ h.p. Enfield** 1910, new 1911, not ridden 1,000 24 miles, condition as new, just overhauled, spares, unused, Rich detachable, valves, and belt; £22.—Gray 164, Victoria St., Grimsby. [X7221]  
**1912 Improved 2-speed 4 h.p. Rex de Luxe**, condition as new, Lucas lamp, riding accessories, spares, only used by engineer for pleasure; £44.—Copley, St. Catherine's Rd., Lincoln. [X7464]  
**1912 Free Engine Triumph**, Palmer cord tyres, guinea whistle, Lucas horn, spares, unsatished, had only 3 months' running; nearest to £45 secures.—Morris, Coten End, Warwick. [X7463]  
**A.J.S.**, 2½ h.p., 2-speed, latest model; Alldays-Matchless, 3½ h.p., 2-speed, latest model, French grey finish; must sell; no reasonable offer refused.—Belgrave Garage, Bristol St., Birmingham. [6557]  
**TRIUMPH**, 1909, fitted with Zenith-Gradua gear, free engine, exceptional condition, unused through winter months; bargain £28.—Drumery Stores, 64, Tilton Rd., Small Heath, Birmingham. [X7167]  
**TRIUMPH**, 3½ h.p., 1912, Miller lamp and generator, horn, spares, new condition, used very little, £41; with sidcar, canoe front, £45; bargain; first cash order secures.—McCutcheon, 36, Spencer Av., Coventry. [X7352]  
**ROVER**, 3½ h.p., 1912, Sturmer-Archer 3-speed gear, delivered June last, ridden 1,400 miles; listed at £59, will accept £49/10; would take a sidcar anywhere; no offers or exchanges entertained; may be seen by appointment.—P. W. Johnson, 22, St. George's Rd., Coventry. [0163]  
**ENFIELD**—Exceptional opportunity. Slightly used Royal Enfield, 2½ h.p., 1912 2-speed, chain drive, only ridden few miles; cost £55/10 recently; take £35 for quick sale; perfect machine—no fault; good reasons for urgent sale.—Box L62, The Motor Cycle Offices, 20, Tudor St., E.C. [6602]  
**LATE 1910 Speed King Rex**, 3½ h.p., single, very fast machine, all spares, including 2 pairs handle-bars, inner tube, watch, lamp, horn, etc., 5 belts, 2 long exhaust pipes, engine just rebored and bushed throughout; exceptional condition; £25, no offers.—Astley, Eaton Rd., Coventry. [X7366]  
**BARGAIN**—Triumph, 1907 model, with 1911 cyl. and piston, 1912 improvements, new belt, Dunlop tyres, Triumph lamp and generator, Jones speedometer, T.T. and touring handle-bars, spares and tools, in splendid running order; take £27/10 or near offer.—Box No. 1,435, The Motor Cycle Offices, Coventry. [0167]

From £5 5s. each.

## EVERY DAY IS BARGAIN DAY AT

# TAYLORS'

Everyone who wants the finest possible value for money with promptest attention to all orders should study this list of our . . .

### STOCKTAKING BARGAINS.

Any article sent by post. The extra cost of postage to be sent with order. Hundreds of desirable bargains. Call or write for special list.

**50 LEATHER CARBIDE CARRIERS.**—To fit on frame or carrier. Hold  $\frac{1}{2}$  lb. tin of carbide. Usual price, 1/8. Sale, 1/2. Post 2d.

**25 TOOL KITS AND TOOLS** complete, containing 12 very useful tools for cyclecar or car. Usual price, 2/-; sale price, 13/6.

**20 LEATHER HIDE TOOL ROLLS.**—Best quality, with fittings for eight tools. Usual price, 3/6. 2/6. Post 2d.

**15 Ditto.**—Cyclecar or car size. Usual price, 7/6; sale price, 4/9. Post 4d.

**25 WIRE-BOUND CLEANING BRUSHES.**—Large size. Bristles will not come out. Usual price, 1/9; sale price, 1/3.

**Ditto.**—For coachwork. Usual price, 2/6. 1/9.

### BELT FASTENERS

of every make in great variety.

**50 Ceterio Belt Fasteners.**—Very strong. Usually advertised at 1/-, 3in., 4in., and 7d. each.

**20 Star.**—3in., 4in., and 7d. each.

**50 D All.**—Adjustable. Usual price, 1/6; sale price, 11d. each.

**16 Triumph Pattern Horns.**—Usual price, 6/3; sale price, 4/3.

### SIDECARS AND BODIES ONLY.

**2 only Milford Herald, soiled;** usual price, £6 6s. . . . . £4 19 6

**1 only Second-hand Sidecar, good order** £3 0 0

**2 only Taylor's 403, cane body, best quality;** usual price, £5 15s. . . . . £4 7 6

**2 only Taylor's 395, ditto;** usual price, £4 15s. . . . . £4 7 6

**Taylor's Wind-screen;** usual price, 32/6 £1 0 0

### HANDLE-BARS AND GRIPS.

**14 Pairs Long Handle-bars.**—3in. and 4in. stem. Usual price, 7/-; sale, 4/11. As new.

**20 Pairs Celluloid Hook Grips.**—3in. and 4in. Usual price, 1/6; sale, 1/2. Post 2d.

**20 Pairs Dover and Celluloid Grips.**—3in. and 4in. Usual price, 1/3. 11d. Post, 2d.

We have also a grand list of Special Bargains in Motor Cycles. As for copies or call and select to suit your requirements.

### MOTOR BICYCLES FOR SALE.

**TWIN** Humber, 22h.p., Armstrong 3-speed gear, 21in. rear tyre, double footrests, belt guard, spare belt, lamp, horn, and spares, splendid condition; near offer to £40.—Geoffrey Smith, Dunelm, Northumberland Rd., Coventry. [6141]

**1911** Twin Rex de Luxe, fitted Roc foolproof 2-speed, Bosch mag., Druids, B. and B., in perfect order throughout, guaranteed, ideal sidecar machine; sacrifice £32/10.—Holland, Clarendon St., Coventry. [X7028]

**HUMBER** Motor Cycles, 1912, new shop-soiled models; 1912 3 1/2h.p. 2-speed, £45; 1912 2 1/2h.p. T.T. or touring, £35; 1912 lady's 2h.p. clutch model, £37/10; ditto, 3-speed, £40; 1912 2h.p., 3-speed, £37/10; ditto, single-speed, £30; for cash only; no exchanges.—Humber Depot, 78, New St., Birmingham. [6615]

**MOTOR Cycles.**—1912 Humber, 3 1/2h.p. and Montgomery coach-built sidecar, £46; 1911 Humber, 3 1/2h.p., 2-speed, £32; 1910 ditto, £25; 1911 2 1/2h.p. 3-speed, £32; 1911 Zenith Gradua, £32; 1910 Enfield, 2 1/2h.p., £15; 1911 Humber, 2h.p., £22; 1910 special Humber, 3 1/2h.p., chain drive, £18.—Humber Depot, 78, New St., Birmingham. [6616]

### SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

PLANT Motors, Bedford.

**2 1/2h.p.** Royal Enfield; 16 gns., complete with spares, 24 good tyres, Dunlop belt.

**3 1/2h.p.** Triumph, good condition, spares, Dunlop belt; 228.

**3 1/2h.p.** Alldays-Matchless, nearly new, lamp, Cowey, 1 Dunlop, Mabon free engine, good spares; £35. [6497]

**1909** Free Engine Triumph, in real good order and condition; £27.—3a, Bridge St., Cambridge. [X6060]

**2 1/2h.p.** Minerva, m.o.v., new tubes, just overhauled, in, running order; £4.—W. S. Green, Gt. Barford, Beds. [6527]

**PREMIER.** 2 1/2h.p., 1912 model, not done 100 miles. Used for demonstration purposes; accept £30.—J. T. Jackson, Statham. [X6674]

**TRIUMPH**, late 1908, perfect condition, lamp, watch, new belt, good tyres, all spares, overalls; £25.—L. Jeffries, Acton Sq., Sudbury. [6536]

**1910** Triumph, engine just overhauled by makers, enamel and plate as new, Whittle, lamp, horn, tools, perfect; £35.—Booker, Wreham, Stoke Ferry. [X7233]

**B.S.A.**, 1912, 3 1/2h.p., free engine, shop-soiled, not ridden, usual price £56/10; also 3 1/2h.p. Multi Rudge, only ridden about 100 miles; what offers?—H. W. Miller, Nene Quay, Wisbech. [X7423]

**5 1/2h.p.** Rex de Luxe, late 1910, just had £10 overhaul and replacements at works, perfect running order, used every day, horn, tools, and spares, Palmer cords and butt-enders' trial given; cleest £35, or exchange 3 1/2h.p.—Gordon Parker, Mildenhall, Suffolk. [6554]

### SECTION VI.

Worcestershire, Herefordshire, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

**B.S.A.**, 1912, T.T., perfect condition; nearest £39; spares.—Spratt, 2, Taft Embankment, Cardiff. [6562]

**1912** Clutch Triumph, not ridden 450 miles, condition perfect; £48.—Postmaster, Henllan, Card. [6501]

**BRADBURY.** 3 1/2h.p., 1910 1/2, mag., excellent climbing condition; £30; after 5.—Dunn, Taft St., Treherbert. [6371]

**1912** Multi Rudge, new August, perfect condition; any trial; 46 gns.—Walker, Horsefair, Kidderminster. [6531]

**TRIUMPH.** 1912, P.E., almost as new, all spares, watch, cyclometer; £49.—Weightman, Oshaston, Monmouth. [X7207]

**TRIUMPH.** 1911 1/2, clutch, excellent condition, full spares and kit; £41, or offers.—Marshall, Belle Vue House, Malvern. [6361]

**RUDGE.** 1912, free engine, new August last, perfect condition; £50; owner buying lightweight.—Jones, Leighton Tetbury, Glos. [6572]

**HUMBER.** 1912 1/2, 2-speed, free engine, ridden 500 miles, new tyre, lamp, generator, all accessories, tools, 3 1/2h.p.; £35.—Wm. Rees, The Cedars, Hengoed. [X7145]

**ROYAL** Enfield Motor Cycle, as new, for sale, abundant spare parts, 2 speeds, twin cyls., Palmer studded tyres.—Tunbridge, Northampton Place, Swansea. [6433]

**TRIUMPH.** 1907, recently overhauled at works, Bosch mag., B. and B., h.h.c., splendid condition, also lamp, horn, accessories; first £18 secured.—Williams, outfitter, Cwmfelinfach, Mon. [X7356]

**HUMBER.** 1912, 2 1/2h.p. twin free engine, only 3 months old and only done 1,400 miles, very fast and in perfect condition in every way, plating and enamel as new, Rom combination on back; £39.—J. W. Love, tobaccoconist, 29, High St., Aberavon, Glam. [X7334]

## The Taxation of Motor Cycles.

**T**HE petition forms which we issued a fortnight ago urging motor cyclists to protest against the proposed new rates have daily continued to pour into our offices duly signed by readers, and by Saturday next, which is the day we require all the petition forms in our hands, we hope to have sufficient evidence to convince the Treasury and every member of the Taxation Committee that the recommendations of the latter are unsound, and, further, likely to do an immense amount of harm to a rapidly-growing industry by preventing new converts from taking up the pastime and restricting the use of the motor cycle. This is the fifth consecutive week we have devoted space to show by example how absurd the new taxes if adopted would prove, and every week further evidence of their weaknesses accumulates.

We might mention that we took particular care to see that the members of the Taxation Committee received a copy of *The Motor Cycle* of October 3rd in which our petition was enclosed, and some of the injustices of the recommended taxes clearly exposed. For further ventilation of the subject we have also to thank a number of leading newspapers for their references to *The Motor Cycle* petition, practically all agreeing that in the light of the weaknesses disclosed by the examples we have quoted success is almost bound to attend our efforts.

As our readers well know, our chief argument against the suggested taxes is the absurdity of rating motor cycle engines on the size of the bore, ignoring the length of the stroke as in the case of motor cars. Such a system will not only influence design and restrict progress, but will eventually become a laughing stock. To quote one or two glaring examples: A J.A.P. engine, measuring 90 mm. bore  $\times$  77½ mm. stroke = capacity 493 c.c., would have been taxed £2 2s., yet an 89  $\times$  89 mm. Bradbury of 554 c.c. capacity = just 61 c.c. bigger, or a 4¼ h.p. Precision, 104 c.c. bigger, would have got off with £1. The Scott (535 c.c.), owing to its short stroke, is rated at £3 3s., which will be the tax payable on the powerful twins of much greater capacity, and now we come to the most absurd example of all. A. owns an Excelsior (650 c.c.) and sidecar, the total weight of which is about 4½ cwt., B. a four-cylinder F.N. motor bicycle (494 c.c.), a machine notably light on

tyres and consequently doing no damage to the road. A. pays £1 for his licence, while B. is mulcted to the extent of three guineas!

These are but a few of dozens of absurdities if the Treasury adopt the committee's proposals and tax motor cycles on their cylinder bore alone. United action must be taken at once to combat these unjust rates, and we desire readers—whether actual or prospective riders—to post to us by Saturday next as many signed petition forms as they possibly can, so that we may use them to the best advantage on behalf of the whole community of motor cyclists, whose numbers must now be approaching 100,000.

## Determined Action Necessary.

**T**HE need for action is pressing, as the Treasury has issued the draft of the new regulations, which are to come into force on January 1st next. These follow the recommendations of the Committee on the Horse-power Rating of Motor Cars, and not one of the injustices we have outlined above has been in any way reduced. Luckily, the regulations are at the present moment only in draft form, and there is time for representations to be made to the Treasury, but unless these are made in the strongest possible form the motor cycle will be handicapped by one of the most unjust systems of taxation which has ever been applied to any form of locomotion.

The Auto Cycle Union has not failed to recognise the seriousness of the position, and it is inviting the co-operation of the Automobile Association and Motor Union, the Scottish Auto Cycle Union, the Motor Cycle Union of Ireland, and the Motor Cycle Manufacturers' Union. Our petition will do much to strengthen the hands of these representative bodies. At the same time, it has been a matter of surprise to us that so vital a matter should have been so tardily taken in hand, not only by the A.C.U., the governing body, but by the Motor Cycle Manufacturers' Union. A serious blow has been dealt at the motor cycle industry, which may affect thousands of workmen. Now that the draft regulations have been issued perhaps they will recognise to the full that the time for action is short, and that, unless the strongest possible representations are made, there will be no chance of obtaining a revision of the unjust propositions contained in the draft.

## SILENCERS.

The first instalment of this article appeared in our last issue.

### Increase of Power Caused by Silencers.

It is often said that if a silencer is of good design it should give more power than if an open exhaust be used. This is partly true and partly not. The explanation generally given is one explosion helps out the exhaust of the one that follows it. So far as single-cylinder machines are concerned this is a pure fallacy, because none could possibly carry a pipe long enough to begin to have any such effect, even could it be produced

(which is doubtful), but there is something more in it with regard to multi-cylinder engines. If the cylinder exhausts direct into the atmosphere, then the gases must accelerate the air they impinge upon to their own speed from rest, whereas if it exhausts into a chamber in which the gases are still moving as a result of the previous exhaust,

Fig. 10.

then the power required for the acceleration is obviously less.

On the other hand, there are many very well authenticated cases where speed has actually been taken off a single-cylinder machine when the whole silencer was removed, such silencer having been admittedly of imperfect design. The explanation is more than probably simply this, that when the exhaust pipe has been removed it has left the exhaust port directly facing the direction in which the machine is travelling, so

Fig. 11.

that the gases have had to emerge against the resistance of an appreciable positive pressure, which at a fairly high speed would certainly amount to as much as, if not more than, the assistance of a bad silencer.

One thing, however, is quite certain, viz., that no silencer worthy the name has any need whatever for a cut-out. It is a plain admission of incompetence on the part of the designer, or that the designer's wishes are restricted by the amount of space at his disposal.

### Why Water-cooled Engines are Quieter.

As has been suggested above, water-cooled engines are quieter than air-cooled engines for the reason that in the former case the temperature of the exhaust gases is less, and hence with the same, or equal silencers, the final outlet velocity has less well-marked peaks in it; or, in other words, is more nearly constant. This matter of cooling is, as may be gathered, of the utmost importance; and that being pretty obviously so, it may well be a source of continual wonder to anyone who has given the matter a moment's thought that so many machines are turned out with nickel-plated exhaust pipes, which accordingly present to the atmosphere the very worst possible radiating surface. No doubt it is done with the laudable intention of making things look nice and keep nice, but it is unquestionably bad from the point of view of the silencer designer. Surely it is possible to devise some matt black surface that is more or less imperishable and looks well.

For the same reason, exhaust pipes should be as thin as possible, and should be made of some material that is more or less dead, as far as producing sound waves of its own is concerned.

### The Shape of the Exhaust Pipe.

If the rate at which the exhaust impulses are felt by the pipe correspond, or are a simple multiple of the vibration period of the pipe itself, a noise due to harmonic vibration will be set up. The best exhaust pipe that can be practically considered would appear to be a very thin cast iron, or cast malleable iron, tube furnished on its outside with a number of radiating flanges fixed at right angles to the axis of the pipe, whilst inside there might be longitudinal fins, which, while enormously increasing the radiating surface, would affect the actual resistance of the pipe to no appreciable extent. A sketch of a half section of the suggested pipe is given in fig. 6, in order to make the idea clear. The pipe would probably have to be made in two halves, so that the internal surfaces could be filed smooth and to allow for thorough cleansing of the interior.

I have already mentioned the very great importance of proper regard being paid to resistances close to the cylinder, where the exhaust gas speed is very high. This is where really good engine design comes in, on account of the effect which is

Fig. 12.

exercised by the shape and contour of the exhaust port itself. It need hardly be said that no silencer, however well planned, can possibly neutralise the initial ill-effect of a badly shaped port. A point where power may easily be lost is in the fitting of the pipe itself. Where, as shown in fig. 7, a union joint is used and the internal diameter of the pipe is slightly less than that of the port, considerable resistance is set up by the sharp corners, and in like manner by the fitting shown in fig. 8, in which the pipe is simply thrust into the port and pinned in position. In this case the port should be counter-drilled, as indicated in fig. 9,

### A Typical Motor Cycle Silencer.

In fig. 10 is given a rough sketch of the typical motor cycle silencer such as is used, with, in some cases perhaps, slight modifications, by a great many manufacturers. Briefly described, it is a cylindrical box with a number of small holes either at the side or in one of the ends. Since it is simplicity itself, if not actual crudeness, it would quite naturally be supposed, as indeed it is sometimes claimed, that there is no back pressure, whereas, as a matter of fact, such a device could not possibly have any quietening effect whatever unless there was a good deal of back pressure. To start with, the exhaust pipe is of very inadequate length, and consequently the gases get no opportunity to cool as they should do, and as a result they enter the "silencer" proper at an exceedingly high speed. They immediately strike the bottom wall of the box at the point marked A, and rebound thence in all directions, setting up a good deal of resistance by the formation of a complicated series of eddy currents.

Still travelling at a high speed, they are forced to emerge through the small outlet holes, unless the cut-out, which provides an alternative route, is in operation. Such a "silencer" may be best described as an instrument which partially interrupts direct sound waves, but does not attempt to deal with the exhaust gases at all. The chamber is of totally insufficient volume, and cooling is totally neglected.

### Gases entering at a Tangent.

It is rather interesting to note that an attempt to get over the back pressure difficulty due to eddy currents has been made by Mr. James Norton, and is incorporated in the Norton motor cycle. It consists simply in directing the stream of gas tangentially to the wall of the cylindrical box instead of diametrically. Beyond fractionally increasing the radiator efficiency of the wall

**Silencers.—**

in the immediate vicinity of the pipe, it is difficult to see what advantage is to be obtained, as, obviously, eddy currents will still be produced by the gas shooting round only at one end of the box.

Another type of instrument is that illustrated in fig. 11, which is furnished on a few makes of machines. It gives evidence of excellent intentions at all events, if nothing else, but suffers in common with the previous type in having so small a radiating surface, so that the gases never get a chance to cool. A really good silencer should let them emerge almost stone cold, and at so slow a rate that they should hardly be felt when the hand is put close against the pipe. However, in this respect fig. 11 is better than fig. 10, but only because a long pipe to the rear takes the place of the series of small holes.

**A Suggested Design.**

Now, since there is but limited space in which to carry the silencer on a motor cycle, it follows, almost as an axiom, that the cooling should be very efficient indeed, and I have already suggested how such an end can be easily achieved with regard to the exhaust pipe. It seems to me that there is no reason, other than that of slightly increased cost, why a

similar idea should not be applied to the silencer chamber itself—that is to say, furnish it very thoroughly with cooling ribs both inside and out.

By rolling a sheet of iron into the form shown in fig. 12, it would be unnecessary to cast the box, so that additional cost would not be very high. Then, as shown in fig. 13, which may be taken to represent a design for a more effective silencer, the silencer box would be very long as well as of fair diameter, and the exhaust gases, furthermore, would enter it axially. The pipe through which they would leave

for there is not the slightest doubt that it would allow the explosions to be heard; at the same time, it would certainly be very much better than the "silencers" now in use on most machines, and it would be almost completely without noticeable back pressure. I will not pretend that it would either look particularly well or clear easily with its ribs and serrated tubes, but it certainly would be practically effective.

Fig. 13.

the main box would have a sealed end, but a number of large holes at the sides. This pipe would stretch to the extreme rear of the machine, where it would carry another small expansion box. In the middle of this the pipe would be stopped up, and holes bored each side of the partition, as shown in the drawing. To increase the cooling area, both this last box and the long pipe itself could be made of serrated section, and all would be finished a dull black.

It is not suggested that this design of silencer would be anything like perfect,

In considering, however, the real silencing of motor cycles, it must be realised that this is by no means the same thing as the silencing of motor cycle engines. Undoubtedly the engine is the worst offender, so far as noise is concerned, but it is a long way from being the only one, and in some machines there are other things which run it very close indeed. To realise which it is only necessary to coast down a hill, first with the engine switched off, and then immediately afterwards with the belt off.

W. G. ASTON.

**JACKSON CYCLECAR.**

The Jackson cyclecar is now complete with its body. As will be seen from our photograph, it is a striking vehicle with artillery wheels, to which are attached 760×90 mm. tyres and high side doors. The latest type of Jackson cyclecar is not yet on the road, but we are enabled, through the courtesy of Messrs. Reynold, Jackson and Co., Ltd., Brunswick House, High Street, Notting Hill Gate, W., to give a few details concerning it. The engine is the 90° 10-14 h.p. fan-cooled J.A.P., 85×120 mm., which is placed transversely in the channel steel chassis position. The drive is by propeller-shaft to the gear box, which contains two speeds and reverse, whence there is a cross shaft driven by bevel on which the sprocket is carried. Thence to the back wheel the drive is by chain. The rear axle is of ample width, and is carried in a separate tubular frame. The vehicle has great

lateral rigidity, so much so that two people can stand on a board attached to the chassis, one of these being outside the wheel track. The chassis is suspended on coil springs in front. The steering is of the rack and pinion type.

**ARMSTRONG GEAR IMPROVEMENTS.**

A call on the Armstrong Triplex Three-speed Gear Co., Icknield Street, Birmingham, last week elicited the information that their motor cycle hub gear improvements are many. The firm are also adding a new pattern three-speed hub gear to the one already manufactured. This latter has a top direct ratio of  $4\frac{3}{4}$  to 1, a middle ratio of  $7\frac{1}{4}$  to 1, and an emergency gear of 11 to 1. It is so constructed that the engine can be started with the driving wheel on the

ground. Mr. Reilly, the manager, informed us that they had had so many applications from sidecar owners for a gear which would give a bottom ratio of 11 to 1 that they had decided to make that their standard for sidecars. This confirms what we have written about hub gears for single-cylinder machines requiring an emergency gear, which should be sufficiently low to make climbing the severest hill a certainty instead of an uncertainty.

Another improvement is the strengthening of the gear operating rod. This in future will be equal in diameter to the clutch push rod. The spindle diameter will be increased to  $\frac{1}{4}$  in., and a new control dispensing with the trigger will also be ready by the date of the Olympia Show.

The company, while kindly providing us with these particulars, wish us to point out that they are not in a position to supply the public at present, but will be ready to make deliveries immediately after the end of next November.

A refinement in the control is the fitting of a horn handle in lieu of the metal handle previously supplied. Detachable brackets for carrying the control lever will be made in three lengths to suit various widths of tank, and the brazed-on type will also be supplied in three lengths— $2\frac{1}{4}$  in.,  $2\frac{3}{4}$  in., and  $3\frac{1}{4}$  in. centres. The clutch pedal will be oval, and the clutch rod will be pushed in by means of a worm and nut instead of the usual levers.

The indirect top gear pattern, which we have had in use for months on New Hudson and Humber machines, will be continued; in fact, the firm are specially arranging to supply both types to cater for different requirements. Some favour the indirect top and others the direct top gear pattern. In 1913 both tastes will be satisfied.

The latest model Jackson cyclecar, propelled by a 90° air-cooled twin engine set transversely.

## THE J.B.S. CYCLECAR.

(1) Side view of the J.B.S. cyclecar. (2) Front view showing how the bonnet tips up and renders the whole of engine, carburettor, clutch etc. accessible.

**T**HE other day a representative of *The Motor Cycle* had the pleasure of a trial in one of these cyclecars, which are being placed on the market by Messrs. J. Bagshaw and Sons, Ltd., of Batley, Yorkshire.

The machine, which has now completed a thousand miles trial, including three clean ascents (successive) with a passenger up Keighley Gate (the hill that caused a great deal of trouble to the competitors in the A.C.U. 1911 Harrogate trial), behaved very well whilst we were testing it on the rough West Riding highways, and held the road nicely at speeds up to about 35 m.p.h. This speed can be exceeded when occasion offers. The seating accommodation for two is ample and comfortable, while under the seat and also at the back are fitted receptacles for all tools, spares, etc. The overall dimensions of the chassis are approximately 9½ ft. x 4½ ft. It is built up of tubular steel and sprung by means of semi-elliptical springs fore and aft.

The engine, an 8 h.p. J.A.P., is placed at the extreme front of the chassis, and therefore receives the full wind pressure for cooling purposes. A leather-to-metal clutch is used with a three-speed gear box and propeller-shaft.

The steering gear is on car lines, as also the general operation of control, one pedal being for a brake fitted on the propeller-shaft, another pedal working the clutch, and a third being for the foot throttle. There are two side levers, one being for the internal expanding brakes on the rear wheels and the other for operating the change speed. There is one lever fitted to the steering column, and this is for advancing and retarding the magneto, which is a Bosch. A single control Lukin carburettor forms part of the regular equipment, and has given very satisfactory results. The petrol and oil tank is placed on the dash, petrol being gravity fed and oil by the J.A.P. automatic lubricator, and also an ordinary pump. The body is of metal, the complete machine weighing about 6 cwt. The position of the engine and the removable footboards make everything very get-at-able.

Altogether the machine behaved satisfactorily, and after one or two slight modifications (which road tests have shown desirable) have been made should prove itself equal to, if not better than, a large number of small cars now seen on the roads.

## The Taxation of Motor Cycles.

A few opinions from readers concerning "The Motor Cycle" Petition.

Sir,—We shall be very pleased to co-operate with you in obtaining as many signatures as possible protesting against the suggested motor cycle taxation, and will have the petition form signed and returned to you in a day or so.

CALCOTT BROTHERS, LIMITED.

Sir,—We will certainly obtain as many signatures as possible for the petition to the Motor Car Taxation Committee.

THE WILKINSON T.M.C. CO., LTD.

Sir,—I enclose my petition together with signatures. I have sent letter to Sir John Simon, and trust every motor cyclist will take this up enthusiastically.

Congratulating you upon your action, and trusting you will fight this to a finish.

E. J. BOWEN, JUN.

Sir,—I beg to enclose you herewith four lists of signatures for the petition against the proposed increased taxation. I trust that your efforts will not be in vain.

Wishing *The Motor Cycle* every success,

E. S. DANGER.

Sir,—I return petition duly signed. Well done! *The Motor Cycle*. We wish you every success.

E. B. BARTON.

Sir,—Please accept my best thanks for the great effort you are making on behalf of all motor cyclists.

T. A. DYER.

Sir,—We shall be very pleased to co-operate with you to obtain as many signatures as possible in protesting against the recommendation of the Motor Car Taxation Committee to tax motor cycles on the motor car basis. If you will kindly send us two or three forms we will have them put in a prominent position here so that our customers may sign.

BOWDEN WIRE, LIMITED.

Sir,—We have much pleasure in returning petition duly signed. We sincerely trust your energies will be rewarded by the proposed new taxation falling through.

THE PREMIER CYCLE CO., LTD.

Sir,—I have much pleasure in sending a few signatures from members of the stock exchange who own motor cycles (and ride them).

PAUL DRINKWATER.

Sir,—Regarding the petition for protest against increase in taxation on motor cycles. You can leave it to us to get as many signatures as we possibly can.

THE REX MOTOR MFG. CO., LTD.

Sir,—I enclose herewith signatures for petition and wish you every success with your project. I had a typewritten copy of your suggested letter written, and rode four miles to hand it personally to our member for Eccles. He promised to attend to it.

F. SHACKLETON.

by "IXION"

## Waterproof Magneto.

As the makers of the waterproof magneto very properly assert, trouble in wet weather can only arise from bad fitting of the cable. The unfortunate thing is that the original fitting may have been carelessly done by an agent, or after having been properly done in the first instance, may be disturbed by the owner and carelessly refitted, as, for instance, when the cable is removed to see how it is fitted, when it is accidentally pulled out of its socket, or when the owner takes it out unnecessarily in the effort to trace a trouble. Two points should always be verified before a machine fitted with a waterproof magneto is taken out in bad weather:

(1.) The cable should be a tight fit in the ebonite bush by which it disappears into the endplate.

(2.) The cable should be caulked into the ebonite bush with wax. The Bosch Co. recommend running melted paraffin wax round the cable at this point, but it is quite sufficient to let a candle drip round the joint.

When these two precautions are taken trouble is impossible. It is, of course, suicidal to remove the endplate in the open air when rain is falling, for the armature has no other protection than the endplate, and water is sure to be blown in under the arch of the horse-shoes. It is wiser to push two miles to find shelter rather than interfere with the endplate in the open.

## Tyre Bursts.

In his article on his personal cyclecar fads Mr. Davies introduced the question of tyre bursts, with special reference to three-wheeled cyclecars. He did not extend the scope of his remarks and apply them to all pneumatically tyred vehicles, and it should not be forgotten that a tyre burst is always a nasty thing, and that no sensible man will use tyres in such bad condition that a burst is at all probable. If we compare the risks attaching to tyre bursts with two, three, and four-wheeled vehicles, I suppose it is beyond contention that a burst is least perilous on a four-wheeler. Mr. Edge's public demonstration over razors and broken bottles with a Napier car at the Crystal Palace some years ago was generally discounted by the fact that a magnificent driver was permanently on the *qui vive* to correct the swerves resulting from a burst cover. But I have personally sustained several sudden bursts on four-wheelers, and I do not regard them as really dangerous. In particular I remember how a front cover burst two years ago when I was driving a light racing car downhill at an excessively illegal speed, and yet I brought the vehicle to a standstill without real difficulty.

The case of two-wheelers is very different; a bad swerve is inevitable; but, as de Rosier showed us when he was travelling at over 70 m.p.h. in his Brooklands race with Charlie Collier, the accident need not produce a smash. *The salvation of the*

*motor cyclist who bursts a tyre at speed lies in his ability to jam his feet down.*

The case of the modern three-wheeler is short of evidence at present, and it would be interesting if owners who have burst tyres on modern three-wheelers at speeds well in excess of legal limit would write to the Editor. I know of one 1906 tricar which sent three people into hospital for this cause before it caught fire last spring, and made tardy atonement for its misdeeds by realising £100 insurance money—about three times its face value!

This machine, like many of its contemporaries, was absolutely unsteerable with a flat back tyre, and its owner could only pray that bursts would occur when there was a pile of hay, or other soft material, somewhere adjacent. I presume the latest three-wheelers are steerable at low speeds with a flat back tyre, and that at high speeds the owner must be content to take his chance, like all users of pneumatically tyred vehicles, from the owner of a racing car to the modest motor cyclist.

Could not some leading manufacturer of three-wheelers give a public demonstration at Brooklands? Whatever danger exists can best be met by only using sound tyres on the driving wheel, by avoiding high speed work in hot weather, and by being very methodical in fitting new tubes. For the circumstances under which bursts are probable are:

1. Using badly worn tyres.
2. Driving too fast on hot days.
3. Nipping new tubes.

H. Vandyk, the well-known Court photographer, with his specially fitted up 1912 P. and M.

## Motor Cycles for Colonial Use.

**W**ITH experience of road surfaces in Australia, Cape Colony, and Rhodesia, as well as in England, possibly my notes on the subject of the ideal Colonial mount may be of interest.

During the last twelve months or so the number of motor cycles in Rhodesia has increased rapidly, and most of the best-known British makes are represented. Beyond the municipal areas macadamised roads do not exist. The "natural" roads of the country are, as a rule, rideable only in the dry season (*i.e.*, the winter), from about April to November, and occasionally in between spells of rainy weather; but during the summer months wheeled traffic converts the surface into a series of ruts along which progress on a single-tracker is impossible. When the surface is wet—except in sandy country—the wheels become clogged with mud and immovable in a few revolutions.

As has often been mentioned in *The Motor Cycle*, manufacturers have as yet paid no special attention to colonial requirements. When they do, I think the sale of suitable machines will be largely increased. For use in or near the larger towns, both in Australia and South Africa, where macadamised roads are general, the standard models fill the bill satisfactorily; but for outside use the design of the whole machine needs to be very carefully considered, and a special colonial model might be turned out for export.

### Height of Magneto and Crank Case Clearance.

For Rhodesian use, the position of the magneto is an important matter. It should be placed as high as possible. Some of the best-known machines cannot be pushed through more than a few inches of

water without the magneto being submerged, and this is a serious drawback where streams have to be forded. In nearly every machine both the silencer and the crank case are so low that great care has to be exercised not to get them damaged by contact with projections on uneven surfaces. Tyres of not less than  $2\frac{1}{2}$  in., and preferably 3 in., in diameter, of greater thickness and strength than are usually supplied with the machines, would give greater satisfaction. Rims and spokes, especially in the back wheels, should be heavier in proportion; and wide hubs, giving greater lateral strength, are advisable.

The transmission question is not such a troublesome one here as it is in a wet country, since very little riding can be done in the wet season. The dry atmosphere at an altitude of 4,500 feet has a deteriorating effect on rubber, and for this reason leather belts are being used a good deal. The conditions of road surface change so much and so rapidly that variable gears give an enormous advantage. What form these should

take—whether hub-contained, counter-shaft, or variable pulleys—is not of so much consequence as that the system shall be absolutely reliable and simple. An important point in favour of a belt or chain drive through a counter-shaft is that the usual large-diameter belt rim, with its great risk of damage from projections, is replaced by a comparatively small rim or a chain wheel.

A free engine clutch and a kick starter give a great advantage to the rider. Although a vigorous man *can* start a fixed geared machine up a steep gradient or on a sandy surface, it is too strenuous an exercise for most people. On bad roads, with perhaps

A "Douglas" rider going through a stream near the Matopo hills, twenty miles from Bulawayo.

(1) The same stream, crossed a mile farther on. The machines are—a Rudge, Triumph, Douglas, and an N.S.U. (2) A Rudge and a Singer descending the hill from the Matopo Hotel towards Bulawayo. Gradient 1 in 7.

**Motor Cycles for Colonial Use.—**

numerous streams to be crossed, dismounts are generally frequent, and the energy saved by being able to restart from the saddle can only be appreciated by those who have tried other methods.

The type of engine most suitable is, of course, a debatable point. From the fact that it gives more clearance than a vertical engine, I favour the horizontally-opposed twin-cylinder type as used on the Douglas machines. With slightly increased cylinder capacity and a choice of gears, such a high engine speed would not be necessary. A single cylinder is less trouble to keep tuned up, and this type will no doubt always find its advocates. The greater part of Southern Rhodesia averages 4,500 feet above sea level, and engine power is consequently reduced by

something like 25%, so that allowance must be made for this loss, either by increasing the original power or by using lower gear ratios. Naturally, high speeds are not often possible, and an average of from fifteen to twenty miles an hour is considered quite respectable travelling, so that gear ratios of, say, 4, 5½, and 8 to 1 would be most satisfactory.

Motor cycles are more often adopted in Rhodesia as a means of getting from place to place, than as a pastime. It is comparatively expensive, and the absence of "made" roads detracts very much from the pleasure, though the "sporting" nature of some of the rides appeals to the more adventurous. Most of the best machines are sold at an advance of 30% to 40% on the English price; and petrol at 3s. 6d. per American gallon. **BERTRAM WOODS.**

## A Run on an 8 h.p. Cyclecar.

**L**ATELY we made a careful inspection of the 8 h.p. Duo car built by Duo Cars, Ltd., York Street, Westminster. The engine, which is set longitudinally in the frame, drives by chain to the counter-shaft, at each end of which are two adjustable pulleys, which are controlled by a side lever, which also pushes backwards or forwards the rear wheels, thus keeping the tension on the belts equal, irrespective of the gear in use. The movable flange slides on a square shaft, and the expanding or contracting of the pulleys is effected by means of a quick pitch thread. The whole is packed with grease and will run without attention for about six months. The steering is worthy of note. The front axle ends forming the bearings for the steering pins are raked, and the arms connecting the tie rod are slightly out of centre, giving a trailing action tending to keep the wheels in a straight line. The movement of the wheels is effected by three strong wire cables wrapped round a fibre pulley, each being provided with a spring at one end to ease the strain, save the wire, and allow for any stretch. The side brake shoes are shod with Service belting (the same type of belt is used in the transmission), and a limited oscillating movement is permitted, allowing the shoe to adapt itself to the rim, while means of adjustment are provided. The wheel hubs are of large size and ball bearings of the cage type are employed, rendering the wheels detachable. The throttle and ignition control are by wire. The engine is the well-tried 8 h.p. J.A.P. with extra outside flywheel. The cooling is assisted by an aluminium fan running on ball bearings.

### The Touring Model.

When Mr. de Peyrecave suggested a trial run, he invited a choice of two vehicles, a racing-looking machine and a smart, well-finished cyclecar fitted with hood and screen. We chose the latter.

During the early part of the run Mr. de Peyrecave took the wheel, and skilfully threaded his way through the traffic to Ealing, thence through the lanes to Denham. When once well away from the haunts of men we took over the control ourselves. The side lever which controls the free engine and gears, if pushed forward applies the brakes, while a second side lever puts extra tension on the belt. Of the two pedals, that on the right hand works the brake, while

that on the left is the accelerator. The steering was good and we did not spare the car. In fact, we drove as fast as the winding nature of the lanes would allow, and yet the perceptible rise up Red Hill, the first gradient encountered on the main road, was taken without a falter. All went well until we were a mile or so from Gerrard's Cross, when the vehicle suddenly gave a heavy list to port, necessitating a quick pull up. An examination revealed that the near side spring shackle plate bolted to the frame had come adrift, as both bolts holding it had sheared. Fortunately, a motor furniture van came by and one bolt was procured which saw us into Beaconsfield. Here another was purchased, and the rest of the run was concluded without further trouble. The several steep pitches between Beaconsfield and Amersham were taken in comfortable style, also Rectory Hill. After tea we followed the same route in the reverse direction, taking Gore Hill with plenty of power in hand and the other short but stiff ascents on top gear.

The springing was good, but a little more care might be bestowed on the design and upholstery of the seats. On the whole the vehicle impressed us most favourably.

An 8 h.p. Duo competing in a hill-climbing contest.

### How to Become a Military Motor Cyclist.

**T**HANKS to the indefatigable efforts of those who have taken up the cause, motor cyclists have at last been acknowledged by the military authorities, and a place has been found for them on the establishments of the Territorial Force—(1) with the Divisional Telegraph Companies of the Royal Engineers, and (2) with the Cyclist Battalions. In order to join, all that is necessary is to write a letter to the "Officer Commanding" the most convenient unit and to ask to be enrolled. I append a list of units:

#### (1.) ENGINEERS.

E. Anglian Divisional Tel. Co. R.E., 13, Hassett Street, Bedford.  
 Highland Divisional Tel. Co. R.E., 80, Hargate Street, Aberdeen.  
 Home Counties Divisional Tel. Co. R.E., Coombe Road, Brighton.  
 East Lancashire Divisional Tel. Co. R.E., Seymour Grove Old Trafford, Manchester.  
 West Lancashire Divisional Tel. Co. R.E., Engineers' Hall, Cropper's Hill, St. Helens.  
 First London Divisional Tel. Co. R.E., 10, Victoria Park Square, E.  
 Second London Divisional Tel. Co. R.E., 67, College Street, Chelsea, S.W.  
 Lowland Divisional Tel. Co. R.E., 192, Main Street, Rutherglen, Glasgow.  
 N. Midland Divisional Tel. Co. R.E., Shelton, Staffs.  
 Northumbrian Divisional Tel. Co. R.E., Barras Bridge, Newcastle-on-Tyne.  
 S. Midland Divisional Tel. Co. R.E., 32, Park Row, Bristol.  
 Welsh Divisional Tel. Co. R.E., 59, Charles Street, Cardiff.  
 Wessex Divisional Tel. Co. R.E., The Priory, Colleton Crescent, Exeter.  
 West Riding Divisional Tel. Co. R.E., Glossop Road, Sheffield.

#### (2.) CYCLIST BATTALIONS.

London Cyclist Battalion, Fulham House, Putney Bridge, S.W. (Detachments: Leigh and Finsbury Park.)  
 Kent Cyclist Battalion, Drill Hall, Tonbridge. (Eastbourne, Canterbury, Chatham, and Maidstone.)  
 Hampshire Cyclist Battalion, Southampton. (Farnborough, Havant, Winchester, and Basingstoke.)  
 Sussex Cyclist Battalion, Ship Street, Brighton. (Also East Grinstead, Hastings, Battle, etc.)  
 Devon Cyclist Battalion, Exeter. (Torquay, Cullompton, Crediton, Dartmouth, and Plymouth.)  
 Welsh Cyclist Battalion, Park Street, Cardiff. (Swansea, Neath, Bridgend, Barry, and Aberavon.)  
 Highland Cyclist Battalion, Birnan, Perth, N.B. (Stirling, Forfar, and Fife.)  
 Lowland Cyclist Battalion, Headquarters Linlithgow. (Boness, Armadale, Bathgate, Uphall, Fauldhouse, West Calder, and Kirkliston.)  
 Northern Cyclist Battalion, 7, Ridley Place, Newcastle-on-Tyne. (Sunderland, Hartlepool, Chester-le-Street, Gosforth, and Whitby Bay.)  
 E. Yorks Cyclist Battalion, Hull. (Howden, Beverley, Bridlington, Hornsea, and Filey.)  
 Norfolk Cyclist Battalion, York House, Rosary Road, Norwich. (Framlingham, Cromer, etc.)  
 Suffolk Cyclist Battalion, Ipswich. (Saxmundham, Lowestoft, Yarmouth, etc.)  
 Essex Cyclist Battalion, Colchester. (Chelmsford, Brentwood, Malden, Rochford, Leyton.)

### The Conditions of Service.

Men between the ages of seventeen and thirty-six are eligible, provided they come up to the physical standard required and pass the doctor as to fitness. They engage to serve for four years, but should they wish to resign before the expiration of their service they are entitled to do so on payment of a sum which is usually assessed as follows: During the first year £3, second year £2, third year £1, and in the fourth year nil. If, on the other hand, the reason for retirement is justified on the plea of business or absence abroad, a free discharge is granted.

During his first year the recruit must put in forty hours of attendance at military exercises, such as recruits drills, lectures, and field days. In subsequent years only ten hours are obligatory.

The attendance at camp (or army manoeuvres in lieu) is for fifteen days, unless a certificate from the employer is produced saying that the man can be only spared for eight days or not at all. Then leave of absence is granted and no penalty exacted. Each man is supplied free with a complete set of arms and equipment and two complete suits of uniform. Whilst at annual camp, in addition to the pay and allowances of his rank, a motor cyclist draws 6s. 6d. a day petrol allowance, whilst in a Cyclist Battalion he also draws £1 a year cycle grant and has any damage made good which is incurred whilst on military service. When attending army manoeuvres the motor cyclist draws 8s. a day petrol allowance (this covers breakages and insurance), and another 8s. a day for hotel expenses if he is not provided with board and lodging.

No man can be called up on any particular day except in the event of a national crisis, when a general mobilisation has been called by an Order in Council.

It will, therefore, be seen that the terms of service are by no means as onerous as some people believe.

### The Social Side.

The class of motor cyclist who joins the Territorial Army is typical of the sport, and nobody but an arrant snob could find anything to grumble at in the company he will have to keep. Moreover, the motor cyclists, whether it be in the Engineers or in the Cyclist Battalions, usually hang together and form a little mess of their own, and here Stock Exchange men, solicitors, doctors, insurance agents, and mechanics hob-nob together and learn to appreciate one another's good points and to get a wider outlook upon life. Even when two men can find no other common topics of conversation, there is always that inexhaustible topic—the motor cycle—for them to discuss and to wax friendly over.

As described above, there is at present room on the Territorial establishment for 112 motor cyclists with the Engineers and 221 motor cyclists with the Cyclist Battalions. About half of these vacancies are already filled, and there appears to be quite a rush for places.

## The Progress of the Motor Cycle.

Impressions by the New President of the Institution of Automobile Engineers.

**I**N the course of his presidential address, read on Wednesday, the 9th inst., before the Institution of Automobile Engineers, Mr. T. B. Browne, M.I.Mech.E., dealt with the progress of the motor cycle. We publish below an extract from his address:

A branch of our craft which has extended enormously within the last year or two, and which has attracted quite an appreciable amount of capital, is the motor cycle industry. It is but a few years since many scoffed at the idea of a successful motor cycle, as they did at the idea of a successful motor omnibus, and as we have seen, the number of motor bicycles registered in this country is about 130,000, not to speak of a large number spread throughout our colonies. I can give you no authentic statistics in relation to the number of motor bicycles now actually in use, for the reason that registrations once made are seldom cancelled, though the machines to which they refer may have been placed on the scrap-heap. However, 100,000 is a round number sufficiently accurate, and it is being added to very rapidly, and it is quite certain that where there is a demand for one car, there will be room for at least a dozen motor cycles. Large makers are now turning out machines by the thousand, and there is a host of smaller makers also busily at work. It will be remembered that a few years back the motor cycle sprang into popular favour, and a large number of these machines were to be seen on our roads, but, curiously enough, after a short period of popularity, they seemed to fall into disuse, until at last it was quite rare to meet a motor cycle anywhere.

The reason of this strange disappearance was due to the fact that the motor cycle had come before its time. Two very important adjuncts had not been sufficiently perfected to make it reasonably safe and reliable. The first was the non-skid tyre, which is an absolute necessity for motor cycles, and the other was the magneto ignition. In the early forms of motor cycles the vibration experienced was so great that no accumulator could be made to stand up against it, with the consequence that frequent breakdowns and renewals of batteries were experienced. The excessive vibration was also so trying to the rider that only the hardy athlete was capable of enduring it.

### The Comfort of the Sidecar.

By going carefully into the question of spring suspension this last objection has been entirely removed, and the problem of springing is, indeed, much easier than with the cars, the weight being so much less. Only those who have taken a ride in a sidecar can realise how very smoothly these lightly sprung vehicles run.

That this is so may be seen in the adoption of the motor bicycle for pleasure purposes by quite middle-aged men, who take out their middle-aged wives in sidecars, and also in the wide use of the machine for commercial purposes in carrying light and delicate goods. It is now no novelty for business firms to equip their travellers with motor bicycles, and they find that it pays them to do so, particularly in districts badly served by the railways, or where railways are few and the distances to be covered great.

This combination of circumstances has been instrumental, in our colonies especially, in bringing prominently before business men the advantages to be derived from the use of the motor bicycle. In several districts in England, Post Office contractors have adopted the motor cycle in their work with great success, the reliability of the machines making its adoption for such a class of undertaking quite safe. In the recent floods at Norwich, motor bicycles and sidecars were used with great success for carrying mails to the beleaguered city when the railway facilities had failed entirely.

As in the car world, each year sees new ideas put forward, but progress in design is necessarily slow, and one step has to

be proved sound before another can be taken. In cycle engine design, the past year has seen no wonderful changes, but there are several interesting portents. For instance, the Tourist Trophy race of 187½ miles, held in the Isle of Man, was won by a two-cylinder, two-stroke, water-cooled, chain-driven machine, at an average speed of 48.69 m.p.h., the cylinders being 69.8 mm. bore and 63.5 mm. stroke. This was not mere luck, for during the race in 1911 such a type of machine covered a lap of 37 miles at a higher speed than any of its competitors, and its victory this year was freely predicted. The extensive experiment with water-cooling which has been going on throughout this year and last thus received very welcome encouragement, especially as water-cooled machines of other makes, though failing in the race owing to tyre and minor troubles, showed a gain in speed on the hills. The result is that water-cooling for motor bicycles is receiving more attention than ever, and is making steady progress towards wide adoption.

This year has seen the production of several cycle engines with rotary valves, but these have not yet been placed on the market in the ordinary way.

### Features of Present-day Motor Cycles.

Other noticeable features of the development of motor cycles shown during the year are the almost universal use of the chain for transmission on high-powered machines, the very common fitting of clutches, and of a foot-starting device, and the wide use of change-speed gears.

Three-speed and gradually variable gears have come much into favour, giving, as they do, a wider selection of ratios with which to meet changing conditions of road and load.

There is also a noticeable increase in the favour with which automatic carburetters are now regarded, and next year several machines will be fitted with these devices. Whatever may be the excellence of the carburettor with adjustable air supply in the hands of the expert, it is certain that the automatic carburettor gives better service in the hands of the ordinary motor cyclist.

These, then, are the principal lines on which mechanical development has taken place in the motor cycle of recent times.

As regards the capabilities of the machine, there is practically no hill in the British Isles which the motor cycle cannot climb, while on the track it has attained a speed of 93 miles an hour, has covered over 3,000 miles in six days, and 20,000 miles in twenty-one weeks with a sidecar, and 40,000 in forty weeks as a solo machine.

A 3½ h.p. B.S.A. two-speed machine climbing Weathercock Hill with a total weight (including sidecar) of 66 stones.

## 1913 MODELS.

**The Williamson.**

Several refinements have been carried out on the new model Williamson, but the most important is the fitting of a spring device in the rear sprocket, so as to abolish any chain snatch. The device

Williamson inlet pipe showing new carburettor position.

consists of two plates, on one of which is fitted the rear or driven sprocket, while the other carries a series of buffer and recoil springs mounted on a circular steel rod, and arranged between stops. Similar stops are arranged on the sprocket carrying plate, and these, when the device is erected, lie between the pairs of washers (marked A in sketch). Thus when the sprocket is revolved the drive is conveyed through the springs to the hub. In actual practice the device works admirably, and a very considerable motion of the sprocket can be obtained relative to the wheel. Other improvements consist of a new inlet pipe, which carries the carburettor inside the frame and behind the magneto, and an improved system of chain guarding.

We had a short trial run on an air-cooled model, and were impressed with the smooth starting due to the spring

drive and the wonderful absence of vibration for so large a twin-cylinder engine. One is apt to consider the Williamson as a sidecar machine only, and though it is built specially for that work we found the air-cooled model very comfortable and handy as a solo mount. It has a wonderfully quick pick up, and yet is as quiet as a lamb in traffic. Mr. Williamson is preparing to manufacture in quantities, and we should not be surprised if the machine becomes extremely popular.

Spring shock absorber fitted to Williamson rear sprocket.

**Two Large Contracts.**

We understand that the Triumph and Humber companies will fit the Sturmev-Archer three-speed hub gear for 1913, these two contracts alone calling for 200 gears per week.

**Zenith Motors, Ltd.**

The chief improvements in next year's Zenith machines will be the introduction of a plate clutch in the hub and a kick starter, which refinements will be supplied as an extra, some original innovations as regards mudguarding and the fitting of a more comfortable saddle. Messrs. Zenith Motors, Ltd., are busy at present with their colonial models, which have a good crank case clearance and yet allow the cylinders to be readily dismantled without removing the engine from the frame.

**Auto-carriers, Ltd.**

For next year very little will be altered in the A.C. Up to the present the most recent improvements have been the fitting of enclosed front wings, the provision of cast iron steps each side of the floor-board of the front seats, rubber covered control pedals, and a new method of operating the top gear. The latter is now controlled by a side lever which works the top speed clutch with the aid of Bowden wires attached to the rod working the expanding mechanism. If the lever is pushed forward the high gear is engaged, if pulled right back the brake is applied. The new automatic Brown and Barlow carburettor, allows the engine to be run slowly.

## AMONG THE ACCESSORIES.

**An Extension Piece for Belts.**

The Stanley Motor Belt Co., 32, London Road, Bromley, Kent, send us particulars of a new belt link. It has been patented by Stanley Webb, and fills a want in that it enables a belt to be shortened or lengthened in a minimum of time. The usual drawback to belt fasteners with long hooks is that a considerable length of the belt is unsupported when passing over the small diameter of an engine pulley. In consequence, there is a jerk which is quite noticeable when the engine is turned slowly, but not very apparent when the machine is running at speed. The

Stanley new hook link.

Stanley link fills this gap, and consists of an ordinary hook fastener at one end and a pin at the other. The link is brought up to the full section of the belt by means of fibre blocks, one on each side. If it be desired to increase the length of the belt, more than one link can be used, and it is claimed that the link is unnoticed and quite silent when running over the pulley.

**Skew Non-skids.**

Our sketch shows the latest pattern Skew non-skid tyre. This tyre is giving the greatest satisfaction on motor bicycles. It will be noticed that the tread is square with a series of recesses situated at intervals around the circumference of the cover. The cover is built absolutely on car lines, and the greatest care is used in its manufacture, while there is an ample amount of rubber on the tread.

Section of the Skew non-skid.

Another form known as the Non-skid is of similar pattern except that the tread is round and it is not quite so heavy. The Skew tyre is made in the following sizes: 26in. x 2½in., 26in. x 2½in., and 26in. x 3in. We hope to submit shortly one of these to a strenuous test, after which we will report on its behaviour.

**A New Leather Belt.**

We illustrate a leather belt made by J. T. Bradford, of 91, Burnley Road, Colne, Lancs. It is constructed of special leather cut in strips, and riveted together with a washer on the top of each rivet so as to keep it in shape. On

Bradford's leather belt.

the inside of the belt alternate ends are allowed to project loosely for an inch or two, so that the belt must always be run in the same direction. This is an important detail which is too often forgotten. We have one of these belts under trial at the present time, and shall report upon it shortly. The belt is very flexible and will bend round the smallest of pulleys.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### Inconsiderate Riding.

Sir,—Re your note respecting Midland riders and the chief constable of Birmingham.

I hope good results will follow the efforts of the A.A. It is a shame that a few would-be "knuts" and budding motor cycle manufacturers should bring obloquy on us all. There is a small band of riders (whose names and numbers are known), and if they do not modify their speeds (and their noise), it will be a simple matter to bring them individually to the notice of the authorities. Some of these riders are quite good performers in hill-climbs, but the majority are "swankers."

Why do they not go and practise on Dinas Mawddwy if they want to let off steam? Though I do not suppose there is more than one of them who could climb Dinas on a single-gear 3½ h.p. machine.

FT 3698.

#### An Appeal to Car Drivers.

Sir,—With reference to a letter by "Medicus" asking for someone to suggest a scheme which will bring "chauffeurs" (I would suggest the word "drivers" here, as chauffeur suggests the paid driver, who, in my opinion, is not the worst offender) of large motor cars to give motor cyclists and sidecarists more room.

As this is the first letter I have noticed complaining of this treatment, I have thought that my own experience must be exceptional, and that I was a most unfortunate individual to meet so many road hogs.

I have driven several makes of machines since 1903 without an accident and without coming into contact with the police, so may claim that I am a careful driver; but many a time I have had to take to the footpath to save a smash.

It is difficult to suggest a scheme to deal with this effectively, but I think that if others like "Medicus" and myself, who feel they have good cause to complain, were to make an effort to secure numbers of offending cars, and send a complaint, with the number, to the R.A.C. and M.U., if they were members of either association this would reach them and probably bring forth an apology.

S. JEFFORD.

#### Hub Gears and Belt Drive.

Sir,—With regard to "Ixion's" query as to the life of three-speed hubs, it is quite probable that the wretched summer has prevented the piling up of big mileages, but I know of one instance in which over 7,000 miles have been covered very satisfactorily by a 5 h.p. machine and sidecar. Of course, this is not a great deal, but it shows that these hubs are getting out of the experimental stage. Within the next twelve months I hope to cover over 10,000 miles on a Triumph with Sturmey-Archer hub in the way of business and pleasure.

I notice that "Ixion" puts in a good word for the direct drive by belt if a large belt is used with a large engine pulley. With a small neat belt guard near the pulley, this drive will be hard to beat, and is much neater in appearance than the combined drive.

Inferior belts of small section made the combined drive necessary, and your contributor did well to champion this arrangement, but now belts are improved and larger, belt fasteners stronger, and bigger engine pulleys can be used, there does not appear to be any particular need for the primary chain, and it is by no means an ornament.

I should think that belt drive, being smoother, will considerably lengthen the life of the gears, as is the case with other kinds of machinery.

ENGINEER.

#### Hill-climbing.

Sir,—I should be glad to know if any 3½ h.p. motor cycle has climbed the hills around Mevagissey (South Cornwall) with a passenger on the carrier. On the 22nd ult. I climbed New Road Hill and (I think it is called) Polkirk Hill with a 12 stone passenger, my weight being 11 stones. A rider of a Scott machine witnessed our ascent, and said he thought we were the first 3½ h.p. to climb these hills.

CHIMPEE.

#### The Definition of Cyclecars.

Sir,—Referring to the letter over the initials "W.S." in a recent issue of *The Motor Cycle*, may I, as a possible purchaser of a Singer cyclecar, express the hope that the makers will not fit wire wheels, as suggested by your correspondent, but that they will adhere to their announced intention of fitting Sankey wheels, which to my mind will be more suitable in every way. They will certainly add to the appearance of the little vehicle, and they are much more easily cleaned.

VERDANT.

#### Cyclecars for Commercial.

Sir,—This is a subject you have broached on occasion, and for the benefit of your readers I can give them a few facts that may help.

The cost to run the G.W.K. works out at 2½d. per mile. This includes petrol, oil, garage, insurance, depreciation, and wear and tear. The enclosed photograph shows the special body I have had made for samples. (It is interchangeable with touring body in two minutes.) The machine is thoroughly reliable, except for it being a little too lightly built in places, but the friction drive is perfect. The machine will climb any hill, and beat nine out of ten cars on any incline. I have done 3,000 miles in two months, which in itself is a testimonial.

My experience of a 3½ h.p. motor cycle is that it works out at 1½d. per mile on 20,000. (You will notice I do not base my figures on petrol only.) I ran an A.C. for a season, which worked out at 2½d. per mile. As encouragement to any commercial interested, I have trebled my turnover in three years, solely through the use of motors.

X 1140.

The G.W.K. referred to in letter from X 1140.

### Chivalry of the Road.

Sir,—To put up against "Melanzie's" experience as described in a recent issue, I should like to relate a little experience that fell to my lot.

About two years ago, when in the old country and out on a long business ride, I broke the exhaust valve of my 1909 Triumph. This misfortune happened to me about six miles outside Bridgwater, and the nearest repair shop of any description was in Bridgwater.

I was carrying a "spare" in my toolbag, but when I came to fit it, I found that my agent had given me a 1910 valve, and, as I was riding a 1909 machine, it would not fit. In despair I packed up my traps, took off my belt, raised my saddle as high as it would go, and started to leg it back to Bridgwater. I had not gone a mile when I met another Triumph rider, who immediately stopped, sold me another valve (the right size this time), assisted me to fit it, and finally (being one of those lucky fellows with lots of spare time) accompanied me for the best part of the day and showed me the way over the very intricate country roads which I had to cover that day and with which he was familiar.

Although I am at present a stranger in a strange land, and, unfortunately, without a mount of any kind, yet I would say that when in the old land I always met with every assistance and courtesy possible from passers-by, although, riding a Triumph as I was, I was more often in a position to render assistance than to ask for it.

Ontario, Canada.

A.C.S.

### Sidecarring in Mysore.

Sir,—I enclose photograph of a 2½ h.p. F.N. and sidecar combination. It is a year now since the machine has been used with a sidecar, and has given the greatest satisfaction with least amount of trouble; in fact, it is far more satisfactory than our new 9 h.p. car. We generally use the combination to take us to the shooting grounds and back, covering twenty to 100 miles a trip, on some of the worst roads imaginable, where it is a common sight to see country carts stranded with broken axles, etc. It is marvellous what the little engine can do on these roads, for it averages eighteen miles an hour. We have never as yet been held up with any mechanical trouble.

We find the shaft transmission ideal for our work, and has safely brought us through many a fix where a belt would have given trouble. To quote an instance, we were once caught in a heavy shower of rain which turned the road into a strip of slush in which the wheels sank in from five to seven inches. With the exception of a stop to clean the float chamber of water, we got home (a distance of twelve miles) without trouble.

The upkeep of the combination is very cheap, as it is light on tyres and does over 100 m.p.g. with sidecar.

The Millford Herald sidecar has stood the rough usage splendidly. A few months back a heavy iron-tyred carriage ran into it, one of the wheels passed over the front of the

Sidecarring in Mysore. (See accompanying letter.)

basket on to the seat, and bent the mudguard; the carriage turned turtle; the axle on sidecar or the tube carrying it was not affected in the least.

Mysore, South India.

WILL THEO.

### A Double-seated Sidecar.

Sir,—Enclosed is a photograph of my wife, daughter, and myself in my special sidecar turnout, taken on Brickfield Hill, on the occasion of the Feilding Motor Cycle Club

Double-seated sidecar referred to by E. F. P. Hinds.

Hill-climb. We successfully climbed the hill, which has a gradient of 1 in 4½; and in the competition for solo machines, which I won, several failed to make the ascent.

The car has a wheeltrack of 3ft. 6in., with two elliptical springs fitted on main axle underneath the body, making seat position very low and comfortable. We have two main frame tubes joining back axle, and these are brought up to one lug, which connects to the main tube at head of cycle. This, with the extension at back, makes it very rigid. The seat and back are upholstered with springs, and I can assure you it is luxury itself to ride in.

Palmerston North, N.Z.

E. F. P. HINDS.

### Petrol Consumption Better on Hilly Roads.

Sir,—The letters in your much appreciated paper respecting petrol consumption and costs of motor cycling suggest that it might interest your numerous readers to learn of my experiences.

Seven months ago I landed a motor cycle with an 85 x 85 mm. J.A.P. engine, Chater-Lea pedalless frame, Druid forks, B. and B. carburettor, Mabon clutch, and Dunlop rubber-studded tyres. I have travelled just on 2,000 miles since, over the very indifferent roads of New South Wales, during which distance I used Shell petrol, averaging 99¾ m.p.g., or a cost of 1s. 2½d. per 100 miles. My total running costs are exactly 1d. per mile. This includes petrol, cylinder oil, tools, lamp, coat, leggings, cap, spares, punctures, *The Motor Cycle* (2d.), "Hints and Tips," "Motor Cycles and How to Manage Them" (1s. 6d.), maps, repairs, licences, etc. I got three punctures and broke three springs in my Druid forks.

On one occasion, in riding over the mountains, I averaged 155 m.p.g. petrol consumption, the roads very, very billy, rising 4,500 feet, in one place over 2,600 feet in twelve miles, and the temperature 24° to 29° Fahr. On another occasion I averaged 125 m.p.g. on a trip of 237 miles, when the temperature during the hottest part of the day was 155° in the sun, say 113° to 116° in the shade; and made yet another run of 258 miles on 2½ gallons.

On some of the roads the surfaces are almost unmade, and they are rough and hilly, 1 in 4, 5, 6, and 8 grades being frequent.

Sydney, N.S.W.

W.G.W.

### The Definition of Cyclecars.

Sir,—In your last issue I notice a paragraph in which "Ixon" refers to a certain make of cyclecar which competed in this year's Six Days' Trials, and suggests that this vehicle cannot have conformed to the rules governing that event.

If I am not mistaken, the cyclecar which "Ixon" has in his mind is one in which the body is separable from the chassis, and therefore it can only be the chassis weight that is in question. The heaviest chassis of any of the competing cyclecars turned the scale at 5 cwt. 3 qrs. 27 lbs., and therefore conformed to the definition of a cyclecar.

T. W. LOUGH OROUGH, Secretary A.C.U.

[According to this letter the body and spares of the cyclecar mentioned by "Ixon" weighed 5 cwts. 2 qrs. 8 lbs.—almost as much as the chassis.—Ed.]

### Importance of Efficient Lubrication.

Sir,—We observe that frequently no distinction is made between "mechanical" and "forced" lubrication. The letter under the above heading in your issue dated the 10th inst. is a case in point. We should, therefore, like to make our point quite clear.

In the W.D. engine the main bearings, crankpin, and gudgeon pin are force lubricated under a pressure of 10 lbs. per square inch (or more, if desired). In the Veloce engine the oil is not pumped under pressure to the bearings; the main shaft runs on ball bearings and oil is thrown on to the big end of the connecting rod, whilst the small end is lubricated in the ordinary way by the oil thrown from the revolving parts.

May we quote from *The Engineer* for November 11th, 1911, and leave your readers to judge whether the claim made by Veloce, Ltd., "to lubricate their engine and gears mechanically in a more efficient manner than is accomplished in any other motor cycle is valid."

*The Engineer* says: "The whole problem of lubrication is to supply the maximum possible amount of oil to the bearings without getting too much on the cylinder walls. The right way to do this is to force the whole of the oil through the bearings before any of it can be thrown into the cylinder, and the only system which does this is the forced feed."

W.D. MOTORS.

### The Stanley-Bailey Match.

Sir,—I notice in your paper of the 10th October a suggested match between Bailey and Stanley at Brooklands, which seems to be of a very sporting nature.

There is another match in contemplation which is also, I believe, for £100 a side, between the Vauxhall and the Sunbeam, and I think this is to be a three-lap race.

Would it not be possible to hold both these events on the same day?

The date at present suggested for the Vauxhall and Sunbeam match is Saturday, October 19th, although nothing is absolutely settled about this.

I think Percy Lambert is making the arrangements.

A combination match between two of the most successful motor cars and two of the most successful motor cycles of the year held at the same time would, I think, be a great attraction.

F. LINDSAY LLOYD,

Clerk of the Course.

[The above suggestion has been placed before Messrs. Whitworth and Mansell.—Ed.]

Sir,—As the acceptors in this challenge, we think we ought to inform your readers that the whole of the details connected with this race have not been settled.

The point that was overlooked by us is that Mr. Bailey himself is having something to say in the matter, and he feels that in a competition of this nature the events should be such as to bring out the relative merits of both machines and riders under conditions with which both parties are equally familiar.

Mr. Bailey is very jealous of his own reputation, and in a letter we have received from him recently he points out that, while Mr. Stanley has had a great deal of experience in road hill-climbs, and is experienced in this form of competition, he himself (Mr. Bailey) has only ridden in one road hill-climb, and he suggests that the Brooklands hill shall be used as one of the events.

A conference is being arranged between Mr. Stanley and Mr. Bailey, and we trust that all difficulties will be got over satisfactorily.

THE COLMORE DEPOT.

### Motor Cycle Taxation.

Sir,—I have much pleasure in enclosing the petition against further taxation of motor cycles, and will certainly send a copy of the proposed letter to our parliamentary representative.

W. R. ROWE.

Sir,—In reference to taxation of motor cycles, the only way as far as I can see in regard to taxation of motor cycles and motor cars is for the Inland Revenue tax to be abolished altogether and put on petrol. It is the only fair way of dealing with this question. If the tax be put on petrol, it will not matter whether you run a 1 h.p. or a 60 h.p.—you will just pay your share whether you run one mile or 1,000 miles. The bigger and heavier the vehicle, the more petrol it will use. What can be fairer?

J. T. BRADFORD.

Sir,—It is with great pleasure that I forward you enclosed list of names protesting against the unfair taxation which the authorities are trying to thrust upon us. I hope our efforts will be successful, as I think we are taxed too heavily now. I, for one, cannot think of keeping a motor cycle if it comes to pass, and I am only voicing the opinion of many others. I am only a working man in the motor trade and could not afford it. Hoping you will not spare any effort on your part to remove the present recommendation, and to reduce the present tax.

J. HAMPSTON.

Sir,—In this district (Gainsborough) we have approximately 150 motor cyclists, the greater part of whom work in the engineering works here. These men are in receipt of a weekly wage of say, 30s. per week, and the value of their motor cycles range from £5 upwards. I should say that fifty per cent. of these are accumulator models, and you know these have a very low value. I feel sure there must be thousands of the working classes, who by dint of hard work and thrift have managed to scrape up sufficient to buy a motor cycle, and who are a credit to the roads so far as their behaviour is concerned. This increased taxation would bear far heavier on them than the more prosperous rider could imagine, and will most certainly compel many of them to give up their best means of recreation.

G. C. WILSON.

Sir,—I have read with dismay that there is a proposal on foot to increase the present tax on motor cycles. This will, I trust, be opposed by all who are interested in this means of locomotion.

If the suggestions become law, then the industry is sure to suffer.

Take my own case as an example. In 1908 I was the owner of a 6 h.p. combination with sidecar, and fitted with a two-speed gear (which I found was indispensable with all its imperfections). Through monetary considerations, I had to give up the pastime. I now want another 6 h.p. sidecar combination, for business and pleasure purposes, and have been in communication with several makers for a new outfit, and I had practically settled for a well known make.

This latest proposal has squashed the whole scheme until I know what is going to happen, as I certainly will not pay £3 per annum tax, besides driving licence and petrol tax.

I reside in Wales, so require 6 h.p. in order to get about with any degree of comfort. If the Chancellor wants something to tax, let him put a £20 tax on those modern "Juggernauts" called steam lorries, etc., which tear about this part of the country in dozens with loads of four and five tons at ten miles per hour. They tear up the roads in a few weeks after steam rolling; consequently it is positive torture for one to ride in a well sprung modern car at more than fifteen miles per hour. I cannot quite agree with your remarks in your leaderette of September 26th, "We do not say this because motor cyclists, generally speaking, are men who cannot afford more, but because we think that on the lines of a general taxation motor cyclists are sufficiently burdened already." The majority of motor cyclists round Merthyr cannot afford more, and, if the tax be increased, then they will have to get rid of their machines. To some who own 5 h.p. and 6 h.p. machines two and three years old, the extra £2 per annum means half of their present running expenses, as they only go out at week-ends for short rides.

MAGNETO

# The B.M.C.R.C. Open Championship Meeting.

## A BIG PROGRAMME.

Sidecar records broken by Barnes (Zenith) and Garrett (Regal-Green).

(1) F. W. Barnes (Zenith sidecar), winner of the hour sidecar race.

(2) Hugh Gibson (Bradbury) filling up and making adjustments at the depot.

(3) S. F. Garrett (Regal-Green), who finished third. Garrett captured the one and two hours sidecar records last Friday at Brooklands.

**H**ELD in glorious weather and with a large number of spectators in attendance, the B.M.C.R.C. Open Championship Meeting was a great success. The fog at the outset was very thick, so bad in fact that the track could not be used, and so dense that people were seriously delayed on their journey down. At 11 a.m., one hour after the advertised starting time, Major Lloyd asked us to go round the track and report on its fitness for racing. We did so, and found the fog clearing off, so the Clerk of the Course, on hearing our report, gave the large assembly of competitors twenty minutes for practising, and at 11.45 the cyclecar race was started.

### The Cyclecar Race.

By this time the fog had almost cleared off, the sun shone brightly, and the air became so warm that overcoats could be taken off. The one hour cyclecar race was for vehicles complying with the R.A.C. and A.C.U. definitions, (i.e., not exceeding 1,100 c.c., chassis weight not exceeding

6 cwt., or if the body and chassis are not separate 7 cwt.) Prizes, the club's gold, silver, and bronze medals and certificates to all who finish.

Though a dozen entries had been received, only five competitors turned up at the starting line. Among these was Robert Bourbeau, the designer of the Bedelia, whom as a mark of hospitality on his visit to our shores, the police saw fit to trap near Surbiton the day previous. Bourbeau was driving the same machine he used at Le Mans.

At the end of the first lap the G.W.K. established a fine lead. Ward driving a Bedelia with a J.A.P. engine came next, followed by the Rollo and Bourbeau, who was not travelling particularly well. Wood on the G.W.K. began lapping at 52, and later increased his speed to 53.99 miles an hour. He maintained his lead, and in the eighth lap was a lap ahead of Ward. In the fifth lap the Sabella started about twenty minutes late, but, despite this fact, put up a good performance. On his tenth lap it was noticed that Wood's off side rear tyre was flat, and on the

RACING IN THE FOG

An impression of the sidecars at full speed. Competitors emerging from the fog which was dense on some parts of the track.

**The B.M.C.R.C. Open Championship Meeting.—**

twelfth lap he came in on the rim, the cover having come completely off. A new tyre was put on in about four minutes, and he restarted. The Sabella stopped owing to a belt coming off. Wood stopped again in his fourteenth lap to replace a high-tension wire which had become detached. A. W. Lambert (Morgan-Jap) started 32m. late. Result:

	Bore and stroke.	c.c.	mls.	yds.
1. J. T. Wood (2 cyl. G.W.K.)	86×92	1,058	47	30
2. R. Bourbeau (2 Bedelia) ...	80×100	1,008	39	1,296
3. C. G. Pullin (2 Sabella) ...	85×95	1,080	32	1,698
V Busby (2 Rollo) ...	85×85	965	10	laps
H C. Ward (2 Bedelia) ...			8	laps
A. W. Lambert (2 Morgan-Jap) ...	85×85	965	7	laps

Wood was inside record until he stopped, and his average speed was only 60 yards outside his own record.

**The Sidecar Race—Records Broken.**

The next event was the hour sidecar race for machines with sidecars fitted with engines not exceeding 1,000 c.c., and carrying a passenger weighing not less than 10 stones. Prizes: The club's gold, silver, and bronze medals, and certificates to all finishing. Barnes led at the end of the first lap, but he shed his belt opposite the timekeeper's box. He was followed by Hunter, Tessier, Garrett, Wells, Applebee, Mago, Ware, Griffith, Hill, Woodhouse, Baskill (who was riding the new long stroke Rudge, 85×132), and Wiles. Tessier and Garrett ran neck and neck for the first place in the second lap, while Wells, Barnes, Applebee, Griffith, and Ware followed in a bunch. Garrett maintained his lead for the first eight laps, and then Barnes recovered his lost ground and took the first place, which he never afterwards relinquished. Garrett pluckily stuck to the second place till the fifteenth lap, and then Wells, who had gamely stuck to his task, crept up to second place. Garrett's performance on the 499 c.c. water-cooled Green-Precision engine is little short of marvellous, and a great credit to an engine of which two years ago we prophesied great things. During the race Hunter retired owing to a frozen carburetter and other troubles, and Ware through a broken cylinder. Two records were broken, as will be seen in the results given below:

	Bore and stroke.	c.c.	mls.	yds.
1. F. W. Barnes (2 cyl. Zenith)	90 × 77.5	998	52	200*
2. W. H. Wells (2 Indian) ...	82.5×93	994	51	840
3. S. F. Garrett (1 Green-Precision) ...	85 × 88	499	50	1,740†
4. F. A. Applebee (2 Indian) ...	82.5×93	994	48	1,734
5. J. Woodhouse (1 Regal-Precision) ...	85 × 88	499	45	1,700
6. G. Griffith (2 Zenith) ...	90 × 77.5	998	44	1,257
7. A. Mago (1 Bradbury) ...	89 × 89	544	43	530

\*Barnes beat his own record, Class E, 49 miles 1,233 yards, March 27th, 1912

C. R. Collier (8 h.p. Matchless-Jap), winner of the five lap race.

†Garrett beat the record he gained last Friday, 46 miles 1,333 yards, which supersedes Stanhope Spencer's record on August 30th this year of 46 miles 557 yards.

Barnes also improved on the fifty miles record time, 57m. 32½s., beating his own record on March 27th, 1h. 0m. 18.6s. Garrett also beat his own record of 1h. 3m. 55½s., 46.93 m.p.h., of the previous Friday, by 5m. 10s. On Friday Garrett also gained the two hours' record, covering in that time 87 miles 889 yards, 43.76 miles an hour. Previous best, Stanhope Spencer (Rudge), 30th August of this year, 86 miles 115 yards.

**Mechanical Notes.**

The contrast in sidecars was distinctly interesting. Tessier had one of the lightest possible sidecars attached to his machine. Others used coach-built sidecars of the Canoelet pattern. Of the machines entered the majority were single geared, and as in these days single geared sidecar machines are an anomaly, it is a pity that variable gears are not rendered compulsory in sidecar races, a starter being forbidden. It is pleasing, however, to note that Barnes, of course, used the Zenith-Gradua gear, and Wells came in second, using the Indian two-speed gear and clutch. Mago (Braibury) had a curiously shaped bell-mouthed air intake, the bell-mouth facing forwards, so that the air was forced up against the end thereof and then back up the pipe into the carburetter.

Start of the hour race for Junior T.T. machines. G. E. Stanley (2½ h.p. Singer) proved victorious.

The long line of starters for the Hour Championship for "The Motor Cycle" cup—at which J. L. Emerson (3½ h.p. Norton) proved the ultimate winner, covering 63 miles 1289 yards in the hour.

### The Junior Hour Race.

The Junior Hour A.C.U. Championship race was really an exciting event. The first prize was *The Auto Challenge Cup* and the A.C.U. gold medal, the second the club's gold medal, the third the club's silver medal, and as fourth prize the club's bronze medal. The winner in 1911 was Harry Martin. McNab rode a Regal-Jap, which looked diminutive beside his bulky form. Scorning a push off which some kind spectator offered him, he said, "Oh! no thanks, I can throw it away if I don't like it." He did not follow out this threat to the letter, but gave up in three laps. Bailey led at the end of the first lap, followed by Newsome, who was seen on a Douglas for the first time, then came Weatherilt, Stanley, Kickham, Colver on the new Enfield, Barnes, Cox, Bashall, Dawson, Martin, and Roberts. In the next lap Stanley took first place and Bailey followed close in his rear. Right up to the fourteenth lap it was a ding-dong race between Bailey and Stanley. The latter's 299 c.c. engine was running in the most extraordinarily efficient manner. Martin, who was running the only accumulator ignited machine, retired owing to the earth wire coming adrift. Barnes gave up through plug trouble. Weatherilt's cylinder blew to pieces in a manner very similar to Ware's in a previous race. Bailey, who was leading in the thirteenth lap, had a valve break in the fourteenth, and Newsome had the valve spring cup come adrift in the thirteenth, but restarted. These various retirements brought Stanley into the first place, and Colver and Kickham into second and third respectively. The result was as follows:

	Bore	and stroke.	c.c.	mls.	yds.
1. G. E. Stanley (1 cyl. Singer)...	69	× 80	299	55	1,260
2. H. V. Colver (2 Enfield) ...	54	× 76	348	53	10
3. E. Kickham (2 Douglas) ...	60.5	× 60	350	52	1,390
4. W. F. Newsome (2 Douglas)...	60.5	× 60	350	50	36
5. W. H. Bashall (2 Douglas) ...	60.5	× 60	350	48	85

The next event was the Five Lap A.C.U. Championship Race, for machines up to 1,000 c.c. First prize the *Motor Car Journal Challenge Cup*, and the A.C.U. gold medal; second prize the club's gold medal; third prize, the club's silver medal; fourth prize the club's bronze medal. The winner in 1911 was C. R. Collier. This time Collier was out to win again, and we noticed he had fitted a forced induction arrangement in the shape of a pipe from the crank case to the bottom of the jet. Collier led from the start, and increased his lead throughout the race. The first lap order was Collier, Bashall, Reed, Godfrey, Baragwanath, Hunter, Printz, Jamieson (who started late), Garrett, Da Silva, and Mills. Second lap order, Collier, Reed, Bashall, Godfrey, Jamieson, Baragwanath, Hunter, Printz, and Garrett. Third lap order, Collier, Reed, Godfrey, Jamieson, Bashall, Hunter, Garrett, and Baragwanath. Fourth lap order, Collier, Godfrey, Jamieson, Hunter, Garrett, Printz, Bashall, and Baragwanath. Collier won easily. Results:

	Bore	and stroke.	c.c.	m.	s.	m.p.h.
1. C. R. Collier (2 Matchless) ...	90	× 78.4	999	10	53½	74.65
2. O. C. Godfrey (2 Indian) ...	82.5	× 93	994	11	45½	
3. H. Hunter (2 Zenith) ...	90	× 58	738	12	40½	

The last event of the day was the Senior Hour A.C.U. Championship Race for *The Motor Cycle Challenge Cup*, presented by this journal. This and the other cups competed for

in the championship races were given to the R.A.C. in 1900 as perpetual trophies for motor cycle events, and as there was to be no A.C.U. race meeting this year they were run off at the B.M.C.R.C. meeting.

The first lap was completed in the following order: Stanley, Emerson, Hill, Spencer, Garrett, Martin, Woodhouse, Godfrey, Collier, Carter, Miller, Vallis, Oliphant, and Tollady. Stanley kept his lead for the next lap, but in the third gave way to Emerson, who kept his place for two laps, and then surrendered the lead to Hill. Emerson again led, then Hill, and finally Emerson, who never again lost his place; in fact he was at one time two laps ahead of Godfrey, who was second when he (Emerson) stopped to replenish. Collier, C. R. Martin, and Godfrey kept together during the greater part of the race. Emerson's long stroke Norton ran like a dream, winning by over a lap, and carrying off *The Motor Cycle Challenge Cup*. The result was as follows:

	Bore	and stroke.	c.c.	mls.	yds.
1. J. L. E. Emerson (1 Norton) ...	79	× 100	490	63	1,289
2. C. R. Collier (2 Matchless) ...	70	× 64.5	497	60	1,660
3. C. R. Martin (1 Triumph) ...	85	× 88	499	60	1,650
4. O. C. Godfrey (1 Indian) ...	82.5	× 93	497	60	1,640
S. F. Garrett (1 Regal-Precision) ...	85	× 88	499	56	740
J. Woodhouse (1 Regal-Precision) ...	85	× 88	499	56	700
T. A. Carter (2 Martin-Jap) ...	76	× 64.5	499	56	660

It will be noticed that only twenty yards separated the second, third, and fourth men. Last year C. R. Collier won *The Motor Cycle Challenge Cup*. The meeting was one of the most successful the B.M.C.R.C. has yet held, alike as regards entries, organisation, and attendance.

As the time trials were postponed owing to the fog, these will be run off at the next B.M.C.R.C. meeting to be held on November 9th.

C. R. Collier (Matchless) and P. Weatherilt (Zenith) at full speed in the Hour Championship Race.

## THE PREMIER CYCLECAR.

Features: 7-9 h.p. M.O.I.V. Engine, Tubular Frame. Chain Drive, Two Speeds.

**L**IKE many other large firms of motor cycle manufacturers the Premier Cycle Co., Ltd., Coventry, have built a light four-wheeler, and the first example was completed at the beginning of this week. It is a very simple little vehicle, so constructed that there is the least possible chance of anything going wrong. The engine is the 7-9 h.p. twin-cylinder described and illustrated in our last issue, and drives through a single chain to a two-speed gear placed amidships. The engine drives from the off side, the valve gear being disposed on the near. A leather to metal cone clutch is mounted on the primary shaft of the gear box, as also is

Chassis of the Premier. The absence of rear springs will be noted.

The gear box is mounted on two flat members and may be slid backwards or forwards for chain adjustment.

as to provide an adjustment for the rear chain.

Front hinge for the body.

a large brake drum. The gear box is of the dog clutch type, the gears being always in mesh and the change being effected by sliding dogs; a direct drive is obtained on top gear.

### Chain Drive Throughout.

From the gear box the drive is transmitted by a single chain to a differential mounted centrally on the rear live axle. This axle follows the usual practice and carries at each end the shoes of powerful expanding brakes which operate one on each rear wheel. The frame is of somewhat unusual construction, being of the braced tubular type, the fore part being narrowed to allow of a big steering lock and raised to permit good axle clearance.

The two-speed gearbox and chain wheels.

The rear axle is bolted direct to the frame members by means of two pairs of flat plates. These plates are slotted so

### The Suspension of the Body.

In front the chassis is suspended on semi-elliptical springs, while the fore end of the body is hinged, the rear being supported on quarter elliptical springs. Steering is by worm and sector, a 14½ in. wheel being fitted. 26 in. x 2½ in. tyres are used, and the machine has a 4 ft. track and 6 ft. wheelbase. The body gives comfortable room for two people to sit side by side, and ample accommodation for tools and luggage at the rear; both brake and change speed levers lie inside

Method of springing the rear of the body.

the body. A dummy radiator adds to the appearance of the little vehicle without interfering with the cooling, for five air scoops are fitted on each side of the bonnet.

### PEUGEOT 1913 MODELS.

The firm of Peugeot Frères will exhibit at the forthcoming shows the following new models. A 3½ h.p. single-cylinder, 84 x 90 mm., with Bowden controls throughout. A stand, carrier, and specially wide mudguards will be fitted to bring this mount up to British requirements. The sidecar model will have a V twin air-cooled engine of 5 h.p., 75 x 75 mm., and arrangements are being made to fit the Armstrong hub gear as a standard. A Millford sidecar will probably be adopted, and the tank of the motor cycle will be enamelled.

The complete vehicle, which, as will be noted, has a dummy radiator

# CURRENT CHAT

## TIME TO LIGHT LAMPS.

" 19th	...	5.58 "
" 21st	...	5.54 "
" 23rd	...	5.50 "

## Short Measure in Petrol Cans.

A reader asserts that nine out of ten tins of petrol he recently purchased were not full and contained less than the two gallons of spirit paid for. It is bad enough in all conscience to pay 1s. 6d. per gallon, but to have short measure in the bargain is really serious.

## Yorkshire made Motor Cycles.

Both the P. and M. and Scott firms are considerably extending their works capacity to enable a larger output of motor cycles. These two Yorkshire products are among the most popular on the market, and for some time the demand has far exceeded the supply.

## Police Trap.

We are informed of the presence of a police trap on the Pinner-Northwood Road. This is always working during week-ends, and occasionally during the week. The distance is a measured furlong, including the Eastcote-Watford cross roads.

## English-Dutch Trial.

Messrs. A. Citroen and J. Ferwerda, the donors of the N.M.V. Beker in the English-Dutch International Trial, have decided that the cup will be won outright by the country winning it on two occasions. In 1913 the trial will be held in England, consequently, should this country prove victors, the final decision will be in Holland in 1914.

## Trips to Olympia.

Trips are already being arranged to the Olympia Cycle and Motor Cycle Show next month. On Saturday, the 30th prox., the Birmingham Centre of the Cycle and Motor Cycle Trades Benevolent Fund will run a trip from Birmingham. Full particulars can be obtained from Mr. A. B. Williams, 13, Weaman Street, Birmingham, or Mr. J. Francis, 50, Alexander Road, Acocks Green, Birmingham.

## An Appeal before the Stewards of the R.A.C.

For the first time since the founding of the Royal Automobile Club the stewards have met to hear an appeal against the decision of a committee. It may be remembered that Vernon Taylor was recently suspended *sine die* by the A.C.U. Committee, and it was against this decision that he appealed. Sir David Salomons, Col. H. C. L. Holden, and Mr. F. P. Armstrong heard the case, and dismissed the appeal after giving the matter due consideration.

## A Thousand Motor Cycles Wanted.

We have received an enquiry for the name of a firm who can deliver a thousand  $3\frac{1}{2}$  h.p. motor cycles next year, with and without three-speed gears. Replies should be addressed "M.T.C.," c/o the Editor.

## Liverpool A.C.C. Hill Climb.

By the kind permission of Sir William H. Lever and the Liverpool Corporation Waterworks, the club has secured the use of the private road up Rivington Pike, Horwich, for its open hill-climb on Saturday. The course will be just under three-quarters of a mile long, with an ideal surface. It is practically straight and has an average gradient of 1 in 10, the worst part being 1 in 8. The club headquarters for the climb will be the Royal Hotel, Wigan. The nearest towns to the hill are: Wigan, Chorley, and Bolton, each of which is about six miles from the hill. 150 entries had been received on going to press, including Harry Martin, F. W. Barnes, P. Weatherill, H. C. Newman, F. G. Edmond, W. E. Cook, F. S. Whitworth, S. W. Phillpott, A. J. Dixon, H. Petty, and K. H. Clark. Further entries will be accepted at double fees.

## SPECIAL FEATURES:

### THE NEW TAXES.

### B.M.C.R.C. OPEN CHAMPIONSHIP MEETING.

### COLONIAL MOTOR CYCLES.

## The A.C.U. Silencer Trial.

It has definitely been decided that this event will take place this year, probably during the third week in December. The standard silencer has been copied, and the regulations are to be sent out immediately.

## The Taxation Petition.

Thousands of forms have been received from readers protesting against the proposed new rates of taxation for motor cycles, but still more are wanted. Motor cyclists should note that all *The Motor Cycle* blue sheets should be returned by Saturday next, the 19th inst.

## M.C.C. Winter Run.

The date of the Motor Cycling Club's annual twenty-four hours' winter run has been altered from Boxing Day night, December 26th, to the 27th inst. The turning point will be Exeter, but in all probability some alteration will be made in the route.

## Partially Illuminated Number Plates.

Motor cyclists whose lamps only partially illuminate the number plate should be careful in Warwickshire. A number of Coventry riders have been summoned and fined, and on Saturday evening some members of the Coventry and Warwickshire M.C. were stopped on the Kenilworth Road. Two, unfortunately, had left their licences at home, so a double summons is likely to follow.

## New $3\frac{1}{2}$ h.p. Sidecar Records.

The Green-Precision water-cooled engine used by S. F. Garrett when he broke the one and two hour single-cylinder sidecar records at Brooklands so handsomely, is the same one he rode in the Isle of Man and other races since. The only difference between the engine and the one Messrs. F. E. Baker, Ltd., will market after the show is that the connecting rod and piston have been reduced in weight to a greater extent than would be advisable for touring engines. Timing, compression ratio, and other essential details are, we are assured, standard. The 1913 engines will, however, have rather larger valves. It is worthy of mention that Garrett weighs nearly 12 stones, and his passenger was no lightweight.

Plan view of the new 7-9 h.p. Premier cyclecar described on page 1179.

**The Trade and the T.T.**

Mr. A. Bednell, secretary of the Motor Cycle Manufacturers' Union, assures us that the manufacturers have not yet discussed their 1913 competition programme.

**A Douglas Cyclecar Promised.**

The latest cyclecar announced is the Douglas, but the machine is not yet ready, as it has not been tested. After all, as Messrs. Douglas Bros. possess such an excellent power unit in their 8 h.p. twin-cylinder horizontal water-cooled engine, it is not surprising that they have been tempted to mount one on four wheels.

**Regrettable Accident to a Club Secretary.**

We regret to report a fatal accident to the secretary of the Bradford-on-Avon M.C.C., Mr. A. W. Wheeler. Mr. Wheeler was riding a 2 h.p. lightweight last week-end and collided at a bend in the road near Norton St. Philip, Bath, with another motor cyclist on a twin-cylinder machine, who was carrying a passenger on the carrier. The other two riders escaped with severe cuts and a shaking.

**"The Motor Cycle" Petition.**

The new rates of taxation are to come into force on January 1st next, unless sufficient pressure can be brought to bear on the authorities. Readers are urged to do their utmost to obtain further signatures and forward the petition forms to us by Saturday next. The example of Mr. A. Eades, 28, Anderton Road, Birmingham, might be copied. He has sent us a lengthy form containing no less than 118 signatures.

**Auto Cycle Union Notes.**

**THE LIVERPOOL CONFERENCE.**—At the Liverpool conference of motor cycle clubs, which will be held on the 25th inst.—the day before the Autumn One-day Trial—the amateur question will be fully discussed. As most people are aware, the matter is one which has engaged the attention of those who take an interest in motor cycle politics for a long time, and a solution to the difficulty is hard to find. It is thought that by suggesting to the clubs that in their competitions classes be instituted for "novices" and "experts" some of the difficulties may be removed. By "novices" are meant those who are private owners who have not gained any award in competition, and by "experts" those who have won prizes. Club secretaries are finding that they cannot run competitions without trade support, and yet they cannot get sufficient entries from private owners, since the latter are unwilling to compete against men whom they have no possible chance of beating. Perhaps at the Liverpool conference some solution may be found.

**THE INTERNATIONAL FEDERATION OF MOTOR CYCLE CLUBS.**—A meeting of the representatives of Scottish, Irish, and foreign motor cycle clubs will be held at Olympia during the show week.

**HONOURS TO THE TAUNTON M.C.C. OFFICIALS.**—Messrs. W. G. Potter and T. Goldsworthy Crump will be awarded the A.C.U. gold medal in recognition of their services to the A.C.U. during the 1912 Six Days' Trials.

FUTURE EVENTS			
Oct.	19.	Liverpool A.C.C. Open Hill-climb.	
"	26.	A.C.U.—Autumn Open One Day Trial.	
Nov.	2.	N. Middlesex M.C.C. Open Winter Reliability Trial.	
"	8-16.	MOTOR CAR SHOW AT OLYMPIA.	
"	25-30.	MOTOR CYCLE SHOW AT OLYMPIA.	
Dec.	..	Auto Cycle Union Open Silencer Trial.	
"	27-28.	Motor Cycling Club Annual Winter Run.	

**The Stanley-Bailey Match.**

On going to press we heard that though Major Lindsay Lloyd's suggestion in our correspondence columns this week to run off the match at Brooklands on the 19th inst. had been considered, it was feared that the time was too short to enable arrangements to be completed for this date. We understand that Stanley is quite ready, but Bailey is preparing an exceptionally light machine with single forks, wood rims, and other light parts. It will be capable of over 60 m.p.h.

**Successful Year's Trading.**

We are very pleased to record the fact that the balance-sheet of Rudge-Whitworth, Ltd., shows a nett profit of £25,098, which with £14,776 brought forward from last year shows an available balance of £39,874. This sum will be appropriated as follows: Two years' 6% preference dividend, £11,200; 5% dividend on ordinary shares, £5,000; to reserve fund, £10,000; to carry forward, £13,575. The Rudge motor cycles were exhibited for the first time at the Olympia Show in 1910, and a record number have been turned out this year. The machine has also been most successful in competitions.

The Enfield Cycle Co.'s report also shows a good profit, the nett amount being £14,055, which with £6,297 brought forward amounts to £20,352. A dividend of 5% has been recommended on the ordinary shares, and 7% on the preference. £5,000 will be added to reserve and £8,707 carried forward. Owing to the development of the industry, additional works have been acquired.

**Motor Cycle "Show Numbers.**

The first of the special show issues of *The Motor Cycle* will be devoted to passenger motor cycles of all types. This number will appear on Thursday, November 14th, the two further show numbers will be dated November 21st and 28th.

**The A.C.C.F. 1912-1913 Programme.**

This club, which is the pioneer club of the motor cycle revival in France, has drawn up a progressive programme for the future. Among the more important events are a hill climb at Gometz on December 1st, the Circuit de Paris on 23rd and 24th March (Easter), 1913, in which twenty English competitors took part last year, and the International Motor Cycle Cup Race on June 13th. There will also be the Paris-London-Paris trial on 15th, 16th, and 17th August, and in September the Tour de France 3,000 kilometres (1,863 miles).

**222 Hour Record Broken.**

On Tuesday last, the 15th inst., at Brooklands, G. E. Stanley, riding a 3½ h.p. Singer, broke the Class C (500 c.c.) hour record. He covered just over 66 miles in the hour, and did laps at 68.5 m.p.h. Nearing the completion of the performance Stanley unfortunately broke a valve; but for this the speed would probably have been higher. We offer Stanley and the Singer Company our congratulations. The previous best time was Stanhope Spencer's 65 miles 803 yards on a Rudge, October 3rd, 1911.

**English Machines in Bavaria**

A correspondent in München writes as follows: "The first big Bavarian reliability run took place on the 5th and 6th inst. over a most difficult road from Munich to the Bohemian frontier and back again—five hundred miles in all. This time English machines were not barred, and secured first and second places. The two days' trial was run off in beautiful weather, and was controlled by officials in cars. The motor cyclists were not allowed to stop their engines within the controls. Severe mountain roads had to be crossed. Result: 1, H. Fränkel (3½ P. and M.); 2, C. Holste (3½ T.T. Triumph); 3, Nicolay (3½ N.S.U.); 4, Mayerhofer (2½ F.N.) There were others competing, such as Douglas, Peugeot, Wanderer, etc. It looks much like the revival of the motor cycling sport."

## A NOVEL GLORIA SIDECAR.

Front and rear views. This special design admits of a handy tool locker and tyre carrier.

Quite an attraction at the Olympia Show will be the sidecar of novel design which the Gloria Cycle Co., Ltd., are introducing for high-powered motor cycles. The body is shaped like a projectile, coming to a very fine point for ward and ending in a plain circle aft. In the back is a locker fitted with shelves for carrying tools, etc., on the lines we recently suggested, and behind is a tyre carrier.

The suspension is ingenious and embodies the well-known Gloria spring wheel, while the body itself rests on three large compression springs, rolling being prevented by light auxiliary leaf springs attached to the two rear coil springs. The chassis is of particularly stout construction, the main frame being carried right round the front of the vehicle, while a circular stay completely surrounds the two ends of the body. From the top of the front circle a fourth

Suspension of the Gloria sidecar body. The spring wheel is retained.

attachment leads to the cycle head. The body has no door, but a neat metal running board affords a simple method of entry. The machine is beautifully

finished in every detail, and is sure to attract much attention. We suggested a streamline sidecar body some months ago, and this is the nearest approach to it we have seen.

## A.C.U. AUTUMN ONE-DAY TRIAL.

This event will be held over a secret route, starting from Kendal on the 26th inst., and will be the last important Auto Cycle Union event of the year. The following officials have been appointed: Judges, Messrs. S. W. Carty, W. B. Little, and the Rev. E. P. Greenhill; timekeepers, Messrs. C. P. Glazebrook and J. A. Walker; and chief marshal, Mr. S. W. Philpott, secretary of the Liverpool Auto Cycle Club.

## DATES OF CHIEF 1913 EVENTS.

The annual meeting of secretaries of clubs affiliated to the Auto Cycle Union will take place at Olympia on the Wednesday during the show week, when the dates of various competitions will be settled. The following are the provisional dates of the chief A.C.U. events in 1913: March 1st, the Spring One-day Trial; Wednesday, June 4th, and Friday, June 6th, the Tourist Trophy Races; July 14th to 26th, the Auto Cycle Union Long-distance Trials; September 24th, the Autumn One-day Trial. The Tourist Trophy Races will consist of two days' racing of four laps each for the machines entered for the Junior T.T. and two days of five laps each for the Senior machines, with one day of rest in between, during which time the machines will be kept locked up. The engine dimensions are to be the same as last year. There is a suggestion that the A.C.U. Long-distance Trial this year should last over ten days, and be run in conjunction with the Scottish Trials. This would indeed provide a searching test of machines.

A motor cycle projectile! A novel design of Gloria sidecar suspended on spiral springs. The frame work, as will be observed, is of special construction.

## THE 1913 BROWN MOTOR BICYCLE.

We have lately had an opportunity of inspecting the latest model  $3\frac{1}{2}$  h.p. Brown. The dimensions of the engine are  $86 \times 86$  mm., 499 c.c. The engine has been considerably improved, being fitted with a greater number of radiating fins, larger valves, which are placed further apart, adjustable tappets, and valve ports of ample dimensions. The same cylinder fastening, hitherto employed by means of two vertical rods fore and aft of the engine attached to bolts running through the crank case, has been retained. This is a very simple and excellent way of fastening down the cylinder with the aid of two nuts only. The exhaust valve lifter is now of the internal type. The compression tap is placed in a most accessible position. Other features of the machine are low riding position and its comparatively light weight. In fact, Messrs. Brown Bros. claim that it is 30 lbs. lighter than the average  $3\frac{1}{2}$  h.p. The excellent Bowden two-speed gear with kick starter and either hand or foot control is fitted.

1913 model two-speed  $3\frac{1}{2}$  h.p. Brown, with chain and belt transmission.

## A.C.F. AND FRENCH COMPETITIONS.

THE Competitions Committee of the Automobile Club of France met recently in Paris, and in co-operation with the following French manufacturers of motor cycles new regulations were established for the 1913 French reliability trials. The firms represented were: Clément-Gladiator, Terrot, René-Gillet, Peugeot, Griffon, Alcyon, and Bedelia. Representing the A.C.F. Competitions

The new  $3\frac{1}{2}$  h.p. Brown motor cycle showing kick starter and countershaft gear.

Committee were MM. René de Knyff, Surcouf, de la Valette, Longuemare, and Forreau. It was decided that the formation of a Federation would not bring about any improvement in French motor cycle competitions, and that it was better for the pastime to encourage a good sporting spirit under the aegis of the A.C.F. Monsieur de Knyff then announced the formation of a sub-committee composed of members of the Competitions Committee and the manufacturers to deal with motor cycle events. The following regulations were decided:

Class I. for motor cycles, sub-divided as follows:  
Single-cylinders, 250 c.c., weight 40 kgs., tyres 45 mm.  
Single or multi-cylinders, 350 c.c., weight 50 kgs., tyres 50 mm.  
Single or multi-cylinders, 500 c.c., weight 60 kgs., tyres 55 mm.

## Class II.—Sidecars.

350 c.c., weight 80 kgs., tyres 50 mm.

500 c.c., weight 100 kgs., tyres 55 mm.

750 c.c., weight 110 kgs., tyres 60 mm.

1000 c.c., weight 120 kgs., tyres 65 mm.

Variable gears optional, but clutches compulsory.

## Class III.—Voiturettes.

500 c.c., weight 100 to 200 kgs., tyres 50 mm.

1050 c.c., weight 120 to 250 kgs., tyres 55 mm.

The makers present would not hear of a motor bicycle class with cylindrical capacity exceeding 500 c.c.

The following definition of a touring motor cycle was drawn up:

Touring motor cycles competing in events held under A.C.F. rules to have two independent brakes, a toolbag (dimensions to be defined later), front and rear mudguards forming an angle in front of  $120^\circ$  and at the rear  $180^\circ$ , to extend from edge to edge at least 10 mm. beyond the tyres on each side, comfortable saddle, footrests, silencer fitted with cut-out, luggage carrier, and tank to contain a minimum of five litres petrol and one of oil.

The industry in France appears to be anxious to support the A.C.F., and an attempt is to be made to form a union of the clubs in Paris to organise big trials next year.

The decision not to support the formation of an International Federation appears to us to be rather unwise, because if all countries were to meet on level ground and formulate rules for the proper conduct of competitions it would be far better for manufacturers of motor cycles and competitors.

## NATAL M.C.C. HILL-CLIMB.

The N.M.C.C. recently held a most successful hill-climb for the Shiniwell trophy at Inchauga, which was attended by a large gathering of spectators. Nearly all well-known English makers were represented, and the timing was carried out by an electrical apparatus made by Mr. C. Morris. The positions of the leaders were:

Rider and machine.	secs.	Formula.
1. P. Flook (T.T. Triumph) ...	51	3772
2. E. W. Banfield (T.T. Triumph) ...	51	3874
3. H. E. Markham (T.T. Triumph) ...	55	4350
W. A. Berkenberg (T.T. Bradbury)	55	4529
R. H. Christian (Norton) ...	58 $\frac{1}{2}$	4917
C. H. Hope (Triumph) ...	61 $\frac{1}{2}$	5047

## AN AUTO-AVIETTE.

A 2 $\frac{1}{2}$  Royal Enfield, prepared for the Pewsey Carnival. The little twin (with cut-out open) made a noise similar to an aeroplane engine, and the propeller was driven by a round belt from the belt rim on the back wheel. The monoplane was on the lines of the Morane, and measured ten feet across.

## Mersey M.C. Hill-climb at Pen-y-Ball.

A. J. Brewer, in the passenger class. He was travelling well, but when nearing the top his belt broke.

THE Mersey Motor Club was again fortunate in having a perfect day for its open hill-climb last Saturday, the weather conditions being more like midsummer than October. Holywell was a buzzing hive of motors of all descriptions. The natives, however, are getting used to it, and appear to like the noise and excitement, and the hotel proprietors were smiling. Tea was difficult to obtain after the competition, every hotel being full.

During the competition the telephone worked well, which was particularly necessary owing to the system of timing. One timekeeper stood at the top with the receiver at his ear, while the starter, holding the transmitter, was placed about thirty yards above the mark where the competitors lined up. On the course being signalled clear, he would shout, "Number —, get ready. Go." The timekeeper at

the top could, of course, hear all this, and clocked them from the word "Go" till they passed him at the finish. Any competitor who passed the starter was considered to have started. If he failed to get going, he was permitted one more attempt. This arrangement worked very well indeed.

### Time and Formula Results.

There were four classes, and the results on time in CLASS 1 (singles or twins up to 350 c.c.), in which nine competitors took part, were:

	Time.
C. Williams (2½ A.J.S.) ... ..	55½s.
F. S. Whitworth (2½ Colmore-Douglas) ... ..	59½s.
S. W. Phillpott (2½ Humber) ... ..	1m. 3½s.

The formula results give the same positions as above.

CLASS 2 (twins or singles between 351 and 600 c.c.) This class drew the biggest entry, sixteen starters facing the line. Results:

	Time.
K. H. Clark (3½ Corah-Jap) ... ..	52½s.
H. C. Newman (3½ Ivy-Precision) ... ..	54½s.
V. E. Horsman (3½ Singer) ... ..	55½s.

Horsman unluckily had a dry skid on his way to the hill, and damaged both himself and his machine.

Formula results: 1, Horsman; 2, Clark; 3, Newman.

CLASS 3 (twins or singles between 601 and 1,000 c.c.)

Of the ten entrants only six took part. Results:

	Time.
J. J. Cookson (7 Matchless) ... ..	44½s.
N. H. Brown (7 Indian) ... ..	51½s.
A. Marston (8 Matchless) ... ..	56½s.

Formula results same as above.

CLASS 4 (sidecars and cyclecars).

Only four turned out, as the regulations insisted on a full-sized passenger. Result:

	Time.
N. H. Brown (7 Indian) ... ..	1m. 15½s.
H. W. Coopland (8 Williamson) ... ..	1m. 42s.

These two were the only competitors to complete the ascent, and on the formula were placed in the same order as given above.

The Motor Cycle formula was used.

C. Williams (2½ A.J.S.) won the Palmer Tyre prize.

(1) P. E. Tollree (3½ n.p. Bat-Jap) crossing the starting line. The starter's telephone may be seen on the right.

(2) H. D. Ashworth (Triumph) half way up Pen-y-Ball.

## CLUB NEWS.

Competitors who took part in the reliability competition on Saturday for the "Bisby Cup," held by the Sheffield and Hallamshire M.C.C. The photograph was taken at the start from "Crosspool," near Sheffield.

## Walthamstow M.C.

The speed-judging competition for the Henbrey Cup resulted as follows:

- |                                 |     |     |      |
|---------------------------------|-----|-----|------|
| 1. J. H. Kerr (3½ N.S.U.)       | ... | ... | 4s.  |
| 2. W. Wilson (3½ Springfield)   | ... | ... | 17s. |
| 3. W. S. Low (3½ Scott and sc.) | ... | ... | 55s. |

The distance of 51 miles had to be covered at a speed of 20 m.p.h.

## South Birmingham M.C.C.

A reliability trial and flexibility test will take place on the 20th inst. The course will be *via* Stratford, up Sunrising, through Tysoe, Ilmington, Chipping Campden, down Weston-sub-Edge, up Saintbury, down Willersey, up Weston-sub-Edge to Broadway, up Fish Hill, down Saintbury, up Willersey, up Tysoe, up Shennington to Stratford-on-Avon, and Red Hill. In the event of a tie the flexibility climb will decide the result.

## Ilkley and District M.C.C.

The following are the results of competitions held recently:

## THE TEAM TRIAL FOR THE HEMINGWAY TROPHY.

The course was one of about 200 miles, being from Ilkley to Kirkby Lonsdale, Kirkby Lonsdale to Keswick and back. One hour was allowed at Kirkby Lonsdale both on the outward and homeward journey for refreshments. Out of fourteen starters ten completed the journey. The result was as follows:

1. Chas. Ackroyd (5 Matchless sc.) and H.V. Sunderland (3½ Triumph), error 1½ marks; 2. Chas. Thackray (3½ Contrast-Jap) and E. Turner (3½ Rex), error 2½ marks; 3. Bert Platt (3½ Triumph) and A. Drummond (5 Johnson), error 7½ marks.

## HANDICAP HILL-CLIMB FOR THE DIXON CUP.

This hill-climb was run off on the knockout system in heats. The hill, which had a gradient of about 1 in 12, was perfectly straight, with magnificent surface, so some splendid racing was seen. There were eighteen entries. The winner was J. A. Hoffmann (3½ Triumph); 2. Burwin Whitaker (3½ Triumph); 3. Wilfred Moore (3½ Bat).

## SPEED TRIALS FOR THE TRADE CUP.

The speed trials took place on a perfect stretch of road in the Blubberhouse district. The measured course was 645 yards long. Electrical timing apparatus (the invention of Mr. A. Griffiths) was used. Each competitor was given a certain speed to do by the Handicapping Committee, the rider beating his set speed the most, or, in the event of no one attaining his set speed, the one nearest to it, to be the winner. Results:

1. C. Thackray (3½ Contrast-Jap), speed given 58½ m.p.h., speed attained 61.65 m.p.h. = +3.15 m.p.h., winning the cup presented by "The Trade," and the club gold medal; 2. W. Mangham (5 h.p. Matchless), speed given 62½ m.p.h., speed attained 64.67 m.p.h. = +2.17 m.p.h., winning the club silver medal; 3. J. A. Hoffmann (3½ T.T. Triumph), speed given 67 m.p.h., speed attained 68 m.p.h. = +1 m.p.h.

Mr. Felix Scriven has unanimously been elected to the presidency of the Ilkley and District M.C.C.

## Mid-Bucks M.C.C.

On the 3rd inst. the members of the above club held a hill-climb on Kingston Hill. The results, decided on formula, were: 1, C. H. Wright (Rudge); 2, T. Hopperoit (Rover); 3, J. W. Tollady (B.S.A.) Fastest time was made by J. W. Tollady.

## Coventry and Warwickshire M.C.

The speed-judging contest last Saturday proved an enjoyable function. A paper trail of eighteen miles was laid on Warwickshire by-roads by the hon. sec., Mr. G. Smith, from a Fiat car kindly loaned by Rudge-Whitworth, Ltd. Eighteen competitors took part, the winners being:

MOTOR BICYCLES.—W. Gibb (2½ Douglas), 2m. slow.

SIDECARS.—V. A. Holroyd (3½ Rudge), 1½m. slow.

CARS.—M. W. Danks (8 Rover), ½m. fast; D. J. Corser (12 Rover), ½m. slow.

The Humberette made its first appearance in competition in this event. S. Wright, who drove, was 3m. slow.

## Oldham and District M.C.

A hill-climbing competition was held on the 8th inst. on the Yorkshire Moors. The hill, which is about a mile long, is quite safe, and some excellent times were recorded. Results:

	SOLO CLASS.	Formula.	Time.
			m. s.
1.	J. Smith (T.T. Triumph)	101	1 7
2.	F. Wood (F.E. Triumph)	111	1 24
3.	P. Platt (T.T. Bradbury)	123	1 15

## SIDECAR CLASS.

1.	J. Smith (T.T. Triumph)	91	1 41
2.	F. Wood (F.E. Triumph)	93	2 4
3.	F. Whitehouse (F.E. Triumph)	104	2 16

The club's A.G.M. is called for the 29th inst., at 8 p.m., preceded by dinner and presentation of prizes.

A group of competitors at Wellesbourne, the starting point of the Coventry and Warwickshire M.C. speed-judging contest last Saturday.

## Club News.—

## Luton and South Beds. M.C.C.

Inter-team speeds trials v. Herts County A. and Ac.C. will take place on October 19th, at Luton Hoo Park.

## Doncaster and District A.C. (Motor Cycle Section).

The following won prizes in the reliability trial to Baldock and back on the 20th ult.: E. Goult (Rudge), H. Borrill (Triumph), G. Brenchley ( $2\frac{1}{2}$  A.J.S.), E. Cro s (8 Matchless), F. Wells (6 Matchless), C. Barnsdale ( $3\frac{1}{2}$  Rex), and J. Smith (Bradbury).

## Bedford and District M.C.C.

A reliability run was held from Bedford to York and back on the 5th and 6th inst. Results:

Solo Class.—1, G. Crawley ( $3\frac{1}{2}$  T.T. Triumph); 2, Waring ( $2\frac{3}{4}$  Enfield).

Sidcar Class.—1, F. W. Jameson (8-10 Jemmy-Jap); 2, S. Crawley ( $3\frac{1}{2}$  Triumph); 3, H. H. Rapley ( $3\frac{1}{2}$  Triumph).

Jameson and Crawley were only separated at the secret check, being "dead on" at all the other checks. Two men went to sleep whilst riding; the first, N. A. Yarrow (Triumph), ran into a gate and did considerable damage to his machine. The second, Haywood (New Hudson and sc.), ran into a ditch. On the outward journey, stops were made at Stamford, Newark-on-Trent, and Doncaster.

## Dundee and District M.C.C.

Very successful speed trials were held at Lunn Bay on the 7th inst. The sand was hard, but a trifle wet, and the weather fine. There were sixty-four entries, and some excellent performances were made notably by A. J. C. Lindsay, J. R. Alexander, who made fastest time of the day, and C. M'Gregor. Results:

## ONE MILE.

Lightweights.—1, C. M'Gregor (Douglas); 2, C. Y. Miles (Douglas); 3, D. Robbie (Douglas). Time, 1m. 25s.

Under 600 c.c.—1, A. Forr (Rudge); 2, H. W. Braid (Morton); 3, D. Robbie (Douglas). Time, 1m. 18s.

T.T. machines.—1, A. J. C. Lindsay (Rover); 2, J. Steele (Indian); 3, O. G. Braid (Indian). Time, 1m. 3s.

Under 1,000 c.c.—J. R. Alexander (7 Indian); 2, A. J. C. Lindsay (Rover); 3, J. Steele ( $3\frac{1}{2}$  Indian). Time, 57s.

## SIX MILES.

Lightweights.—1, C. M'Gregor (Douglas); 2, C. Y. Miles (Douglas). Time 9m. 56 $\frac{3}{4}$ s.

Under 600 c.c.—1, D. Robbie (Douglas); 2, H. W. Braid ( $3\frac{1}{2}$  Morton); 3, J. H. Ferrier ( $3\frac{1}{2}$  N.S.U.). Time, 9m. 13s.

T.T. machines.—1, J. Steele ( $3\frac{1}{2}$  Indian); 2, O. G. Braid ( $3\frac{1}{2}$  Indian); 3, A. B. Watson ( $3\frac{3}{4}$  Scott). Time, 8m.

Under 1,000 c.c.—1, J. R. Alexander (7 Indian); 2, O. G. Braid ( $3\frac{1}{2}$  Indian); 3, J. Steele ( $3\frac{1}{2}$  Indian).

## DONCASTER M.C.C. RELIABILITY TRIAL.

S. Nettleton and J. H. Wilkinson caught in one of the secret checks.

## Bishop Auckland and Darlington M.C.

The results of the recent hill-climb are:

Touring Class.—C. W. Smith (2 $\frac{3}{4}$  New Hudson).

T.T. Class.—C. Bone ( $3\frac{1}{2}$  T.T. Smith-Precision).

All-comers' Class.—C. Bone ( $3\frac{1}{2}$  T.T. Smith-Precision).

Sidcar Class.—C. Bone ( $3\frac{1}{2}$  T.T. Smith-Precision).

Twin Class.—E. T. Glaister (5-6 Rex).

The formula used was  $\frac{C \times T^2}{W}$ , as recommended by *The Motor Cycle*. The fastest time of the day was made by C. Bone.

Doncaster and District M.C.C. trial to Baldock and back. Checking competitors in Tuxford market place.

## TWO NEW WORLD'S RECORDS

Created at Brooklands, October 3rd and 5th, 1912, by Mr. G. E. STANLEY, on his  $3\frac{1}{2}$  h.p. Singer, using a

## Club News—

K. Holden (B.S.A.), winner of his class in the Birmingham M.C.C. flexibility hill-climb held near Evesham.

## Leads M.C.C.

After several postponements the annual run to Edinburgh took place on the 28th and 29th ult. A start was made at 6.30 a.m. The route left the Great North Road at Scotch Corner and turned across the moors through Bowes and Brough, thence *via* Appleby, Penrith, Carlisle (lunch), Longtown, Eskdale, Mossbail Summit, Hawick, and Galashiels. Out of seventeen competitors seven reached Edinburgh. On the return journey the coast road was taken through Dunbar, Cockburnspath, Berwick, and Alnwick, where a steady downpour commenced. J. Stuart-White (Bradbury) won the solo, and J. Tattersall (Bradbury) the sidecar class. Other finishers within schedule time were A. Mackie (3½ New Hudson), J. Wilkinson (4 Singer), and Brewis (B.S.A.).

## The Brookdale Club, Catford (Motor Cycle Section).

A hill-climb for members was held during the week-end, at Westerham, Kent. There were no mishaps of any kind, and some excellent climbs were made. Results:

## CLASS I.—Machines up to 554 c.c.

	Fig. of merit.
1. R. A. Croucher (Kerry-Abingdon) ...	74
2. S. T. Tessier (Bat) ...	75
3. W. F. Guiver (Rudge) ...	81

## CLASS II.—Machines up to 1,000 c.c.

1. R. A. Croucher (Kerry-Abingdon) ...	73
2. S. T. Tessier (Bat) ...	75
3. W. F. Guiver (Rudge) ...	78

Fastest time of the day: R. A. Croucher, 52½s.

## CLASS III.—Sidecars.

1. H. A. Cooper (Bradbury) ...	72
2. W. F. Guiver (Rudge) ...	83

## Heris County A. and Ae.C. (Motor Cycle Section).

There will be a slow hill-climb on the knock-out system at a hill not far from Welwyn on Saturday, October 26th, at 3 p.m. sharp. Separate classes will be run for single and twin-cylinder machines.

## Furness M.C.C.

The members of the above club held their last competition of the season on Saturday, 5th inst., in the form of a secret reliability run. The course was a circular one of 46½ miles. Eighteen miles per hour was to be maintained throughout the journey. There were no fewer than seven checks, four of which were secret, and Lindale Hill was observed. Possible marks 120. Result: 1. E. E. Clow (6 Zenith), 118½, and H. C. Wilkins (P. and M.), 118½, equal; 3. W. Jones (5 V.S. sc.), 113. Two competitors failed on Lindale Hill and retired.

## Middlesbrough and District M.C.C.

A time trial was held on the 21st ult. for sidecar and solo machines over a course of fifty-three miles. There were eight open and four secret checks, and competitors were penalised a mark for each minute under or over schedule time.

## Winners:

Sidecar Class.—1. B. Ayrtton (3½ James sc.), 5.27m. out.

Solo Class A.—1. C. F. Blincoe (3¼ Scott), 7.20m. out.

Solo Class B.—1. H. B. Beckwith (2¾ Douglas), 9.50m. out.

On the 28th ult. an all equal hill-climb was held on Yearby Bank. D. K. Webster (3½ Triumph) made least divergence from schedule time. During the competition S. Gjertson (7 Indian) made a record ascent of the hill in 44s.

## Newcastle and District M.C.

The Bevan-Goold reliability run and hill-climb was held on the 22nd ult., when the competitors and officials were favoured with glorious weather, and eighteen competitors finally faced the starter; of these nine survived the trial. The course was of a very heavy nature, being *via* Hexham, Brunton Bank, Stagshawbank Top, West Woodburn, Elishaw Bridge, Otterburn, Rothbury, Alnwick (*via* Lakeside and Corby Hills), Wooler, Millfield, Cornhill, Coldstream, Kelso, Jedburgh, Hawick, Langholm, and Brampton to Newcastle-on-Tyne, *via* the Military Road. Competitors were required to make their own feeding arrangements, no time being allowed for this, so making the competition a test for the competitor as well as the machine. Results:

Reliability Trial (Silver challenge cup, presented by Mr. J. E. Goold, and silver tankard).—1. G. W. Raper (2½ A.J.S.); 2. R. J. Robson (8 Chater-Lea sc.); 3. R. Wilson (3½ Triumph); club enamelled silver medals—1. Baty (4½ Dene sc.); F. A. Rudd (6 Rex-Jap), and F. Turvey, jun. (3½ B.S.A.); club bronze medal—Cecil Armstrong (3½ Ivy-Precision).

Hill-climb, Single-cylinder Class (Silver challenge cup, presented by Mr. Edward Bevan, and silver medal).—1. G. W. Raper (2½ A.J.S.).

Multi-cylinder Class (Silver challenge cup, presented by Mr. Edward Bevan, and silver medal).—1. F. A. Rudd (6 Rex-Jap).

Sidecar Class (Silver challenge cup, presented by Mr. Edward Bevan, and silver medal).—1. I. Baty (4½ Dene sc.).

Harry Long (4 h.p. two-speed Singer sidecar), the only motor cyclist who has ever claimed "20,000 miles in 20 weeks without a single involuntary stop," tried his luck on Brooklands recently. He covered a lap at 37½ m.p.h.

# Questions & Replies

A selection of questions or general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

**Benzole for Motor Cycle.**

Can I use benzole for my motor cycle without risk of damage? and can I mix it with petrol? If so, kindly give quantities.—B.H.T.

You may use benzole without doing any more damage to your engine than perhaps sooting it up a little; but you will find it necessary to give more air. You would be advised not to mix it with petrol. See *The Autocar* for October 5th.

**The Motor Cycle in Ceylon.**

I am going to Ceylon rubber planting in a fortnight's time. What are the prospects of motor cycling in Ceylon? Are the roads fairly good? Are there many machines out there? What is the price of petrol and oil, etc.?—A.F.B.H.

The roads in Ceylon are quite good, on the whole—naturally, not so good as they are in England, and they are well graded; but some of the hills are long. The pastime is going ahead very strongly over there. Petrol and oil are slightly more expensive than in England. It is advisable to take some spare parts with you.

**Skirting London.**

I should be very much obliged if you would send me the best route from London to Ipswich. I wish to avoid the London traffic, as I live in West London, and would like to strike on the main road at Chelmsford.—S.S.

Your best route would be as follows: Chiswick, Goldhawk Road, Shepherd's Bush, Wood Lane, which follow straight through till you reach the turning to the Bathurst Gardens, then go straight through West Avenue, Cavendish Road, West End Lane, after which take the right-hand road, which will bring you up to the top of Fitzjohn's Avenue, then go past The Spaniards, down Bishops Road into the Great North Road. Immediately after you have passed East Finchley railway bridge turn right, and continue absolutely straight on till you strike the Ware Road, just after the point where the Seven Sisters Road joins it. Go straight across this through Tottenham Hale, then turn right, continuing straight on across the Marshes to where you join the Woodford Road. (This route is somewhat difficult to explain, but is clearly shown on the R.A.C. Official Map of Recommended Routes Round London, which can be obtained from these offices, price 1s. 7d. post free.) You can then continue through Epping, Ongar, Chelmsford, Witham, and Colchester to Ipswich.

**Eye Levers.**

(1.) Will you please tell me how to remove the back wheel cover from a motor bicycle, having a belt rim one side and a dummy belt rim for the brake on the other? Is any tool sold for the purpose. (2.) Is belt slip readily distinguishable from clutch slip?—G.O.S.

(1.) We do not know of any special lever sold for this purpose. The problem is certainly a difficult one. (2.) Only by making sure that the belt is perfectly tight. If this is the case, it is obvious that the slipping is in the clutch and not the belt.

**London to Bournemouth.**

I am thinking of going from London to Bournemouth, and would like your advice as to the best route, giving mileage, etc., and the charge for admittance to Brooklands, as I should like to have a turn on the famous track. Would it be safe to go on the track with ordinary touring handle-bars?—S.J.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

The route from London to Bournemouth would be as follows: London, Kingston, Cobham, Ripley, Guildford, Hog's Back, Farnham, Alton, Alresford, Winchester, Romsey, Cadnam, Lyndhurst, Christchurch, Bournemouth. The distance is approximately 129 miles. The admission to the track is 1s. You would be quite safe to try your machine thereon.

**Starting on Stand.**

(1.) Would you please tell me in what way I can start up a Douglas two-speed model H 1912 machine on the stand? As it is not a free-engine, I have not yet been able to do so, and there are no pedals to assist in starting it. (2.) Would this machine be suitable for sidecar work?—T.J.K.

(1.) We have tried ourselves to start our own 2½ h.p. Douglas by pulling over the back wheel, but it does not seem to take kindly to it. You really want to run the machine on the low gear, and the first time the cylinder fires throw the lever into neutral. Then you can throttle down and jack up the machine if you desire to. The makers have wisely prevented this machine from being started on the stand, and thereby probably greatly increased the life of the engine. (2.) The machine is not suitable for sidecar work. Though it will take a sidecar, it is not fair to ask it to do so.

**A COMPARISON. 10 H.P. CYCLECAR—20 H.P. CAR.**

The Singer cyclecar being such a perfect miniature of a big car, and to scale in every part, it is difficult to gain an idea of its small size from pictures. The above photograph of the cyclecar beside a 20 h.p. Singer conveys an excellent idea of its relative proportions.

# accepted

That will take place as under—

**At BROOKLANDS, a five lap and a ten lap race, and—a hill-climbing contest on a Hill to be chosen later (dates to be arranged).**

The details were left to a Committee consisting of the Hon. Secs. of the following Clubs: Coventry and Warwickshire Motor Club, Oxford M.C.C., Sutton Coldfield and Mid-Warwickshire A.C., Mersey Motor Club, together with the Editors of "The Motor Cycle" and "Motor Cycling," but one condition was mutually agreed, viz.—

That puncture or belt troubles on the part of either rider, and in either event, should necessitate a re-start.

That's the match—the Tit-bit of the year, and now—

## THE WALL TRICARRIAGE

Built like a car

**Originates—does not imitate.  
Takes its model from the car.**

- \_\_\_\_\_ Shaft transmission. \_\_\_\_\_
- \_\_\_\_\_ Differential axle. \_\_\_\_\_
- \_\_\_\_\_ Two driving wheels. \_\_\_\_\_
- \_\_\_\_\_ No belts or chains. \_\_\_\_\_
- \_\_\_\_\_ Roc patent two-speed gear. \_\_\_\_\_
- \_\_\_\_\_ Easy and safe to drive. \_\_\_\_\_
- \_\_\_\_\_ Cheap to maintain. \_\_\_\_\_
- \_\_\_\_\_ Light on tyres. \_\_\_\_\_
- \_\_\_\_\_ Turns in own space. \_\_\_\_\_
- \_\_\_\_\_ Weatherproof—does not skid. \_\_\_\_\_

**The comfort of a car.  
The economy of a motor cycle.**

Orders are now being executed for the 1913 two-seater model of the same type that will be exhibited at the forthcoming Olympia Show.

Trial runs are available any day by appointment, either at the Works or at the London Agency.

Booklet describing the machine will be sent on application.

Sole Makers and Patentees:

**A. W. WALL, Ltd.,**  
Roc Motor Works,  
**Hay Mills, BIRMINGHAM.**

LONDON:

Messrs. ROBERTSON'S, 157, Gt. Portland St., W.

T. A. Edwin, Eastern Divisional Commander of the Salvation Army, who uses his  $3\frac{1}{2}$  h.p. Brown regularly and speaks in praise of its reliability. The owner's work in East Anglia renders the motor cycle's duties by no means inconsiderable, but he tells us he can run with almost "Bradshaw" precision.

#### Local Taxation Licence.

**?** I own one motor cycle and have purchased a second, and am selling the original one. If I place it in the hands of an agent to sell for me, that is, leave it stored on his premises, may I use the new one without taking out another revenue licence?—F.H.B.

If you do not use your old machine after taking the new one on the road you are not liable for a second licence, otherwise you must have a second licence, which, if purchased after October 1st, will cost 10s.

#### Pitting of Exhaust Valve.

**?** Will you kindly help me out of my difficulty with my 1912 standard motor cycle? My exhaust valve gets badly burnt or pitted after about 100 miles running, so I have to grind my valves often, or the compression goes away entirely. I use a B. and B. carburetter with a No. 32 jet, and Price's Huile de Luxe for lubricating.—W.M.

The trouble is due to the exhaust valve being composed of incorrect material. What you had better do is to write to the makers about this, and if they do not send you a valve which wears better you had better get one specially made.

#### Overheating.

**?** I should be very pleased if you could tell me the cause and remedy of the following: I have a  $3\frac{1}{2}$  h.p. 1910 Fafnir, overhead m.o.v. About two weeks back I took the cylinder down and cleaned it, up to which time I had had no trouble whatever. Since then I have had overheating to such an extent that three exhaust valve stems have broken. I find the valve to be badly pitted after running about five miles. I have tried various mixtures, but fail to remedy. I can, however, run with full air and about one-third gas. Do you think the timing is wrong? I give one pump of lubricating oil about every five miles. I use a sidecar, and run on a 33 jet. Is this too large?—W.M.

It is almost impossible to account for the trouble of which you complain. We

do not see what harm you can have done when taking down the cylinder and cleaning off the carbon deposit. We do not see how the timing can be wrong. The only way to tell whether the timing is wrong is to check this over. A 33 jet is on the large side, but not sufficiently so to account for the trouble. Are your exhaust pipe and silencer choked or obstructed in any way?

#### London to Edinburgh Run.

**?** Next March I intend purchasing a  $3\frac{1}{2}$  h.p. Triumph with a three-speed gear. I am very keen on entering for the M.C.C. London-Edinburgh and back trial, but a friend of mine, who has had some experience of competitions and trials, says I have "no earthly chance" of success. Now at the time of purchasing the machine I should be an absolute novice, but I should spend the Easter holidays on it and all week-ends previous to the trial. I am not of a mechanical turn of mind, but, in spite of this, am disinclined to agree with my friend, especially considering the reputation of reliability this make has won. However, I should value your opinion. Also the 800 odd miles (almost continuous), do you think that would affect the engine to its detriment?—A.B.W.

Anyone who can stand the fatigue of sitting on his machine and allowing it to take him along, and who can keep awake for one night, can get through the London-Edinburgh run and gain a gold medal. All he has to do besides sit on his machine is to keep within a quarter of an hour of schedule time to get the single journey gold medal. To get the double journey medal he has to do the same thing again after one night's rest. To get the cup is certainly more difficult, as this is simply a matter of adhering to a certain speed. There is no further test for the reliability of the

machine; it requires, however, a certain amount of practice. It is not reliability alone which gains the cup, but adherence to schedule time, and simply to the ability of the rider to guess his speed. As the whole ride is taken at a very easy speed, it cannot affect the engine any more than an ordinary run.

#### EXPERIENCES WANTED.

Readers desirous of obtaining the experiences of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries below should be addressed c/o The Editor.

"C.R.W." (Brighton).—8 h.p. Matchless for sidecar work.

"J.H.S." (Dorset).—Reliability of Bowden two-speed counter-shaft gear with  $3\frac{1}{2}$  h.p. Bradbury or other standard  $3\frac{1}{2}$  h.p. machine.

"Dr. N.S." (Wien, Austria).—The Scott for use in the Alps; solo and sidecar.

"P.C.B." (Crawley).—A satisfactory exhaust whistle for a 1912 Douglas.

"W.G." (Newcastle).—Mabon variable gear with Triumph and sidecar.

"C.W.H." (Croydon).—T.M.C. and 8 h.p. water-cooled Williamson.

"W.J.K.B." (Dublin).— $2\frac{1}{2}$  h.p. Levis. Lubrication, liability to overheat, and petrol consumption.

"C.D.M." (Edinburgh).— $3\frac{1}{2}$  h.p. P. and M. and sidecar.

"W.J.P." (Dublin).— $3\frac{1}{2}$  h.p. Triumph. Solo and with sidecar. As regards reliability, hill-climbing, petrol consumption, and wear on belts and tyres.

"J.D." (Cardiff).—Mabon or Albion free engine clutches.

"W.H.T." (Harwich).—Pillion or tandem seats on  $3\frac{1}{2}$  h.p. motor cycle and variable gear used.

"W.T.M." (Dublin).—Binks two-jet carburetter fitted to a  $3\frac{1}{2}$  h.p. 1912 Indian. Is it better than the pilot jet carburetter fitted as standard?

#### THE SIDECAR POPULAR IN SOUTH AFRICA.

With so much attention being paid to cyclecars, it behoves manufacturers to remember that the sidecar is exceedingly popular, and likely to remain in public favour for a long time to come on account of its cheapness, low cost of running and general reliability. Our photograph shows a group of Cape Town sidecarists.

**Connecting Rod Construction.**

This invention is intended for application where two connecting rods drive on to the same crank pin. The connecting rod A is provided with two

side lugs B, between which passes the end C of the second connecting rod. A bush D is then inserted in the eyes of the rods and spun or riveted to the lugs B. Interposed between the crank pin E and the bush D is a floating bush F, the object of which is to reduce wear to a minimum. Suitable ducts are formed to convey the lubricating oil to the various faces.—Blumfield, Ltd., and T. W. Blumfield, No. 25,727, 1911.

**An Interesting Cyclecar.**

The accompanying elevation and plan show clearly the general arrangement of a three-wheeled two-seater vehicle on cyclecar lines. Two wheels A B are arranged in the same plane, and are both operated for steering purposes. The third wheel C is driven through clutch and shaft gearing from the engine arranged at D. Other particulars are readily obtainable from the drawings.—W. Starley, No. 16,820, 1911.

**Accessories to a Record.**

When G. E. Stanley broke the five and fifty miles records he used a Pedley belt, Dunlop tyres, and Wakefield Castrol oil.

**Catalogues Wanted.**

Rag. Guido Parodi, Vico Giannini, 12 Genoa, would like the leading firms of motor cycle manufacturers to send him their latest catalogues.

**A Double Success.**

Continental tyres and a Continental belt were used by E. F. Baxter when he won the Reliance Cup in the Liverpool A.C.C. open reliability trial on a twin Rex machine.

**Changes of Address.**

The Moto-Rève Co., Ltd., inform us that they have changed their address to Moto-Rève Works, Alpertons, Middlesex.

We are informed that the London depot of the Clipper Tyre Co. is at 102, Lennard Street, E.C., off Great Eastern Street, E.C.

**New Sidecar Model.**

With reference to the Swan sidecar illustrated on the 26th ult., page 1,096, the makers, the Midland Motor and Cycle Co., Cowley Road, Oxford, state that they are manufacturing and putting this on the market at once, the chassis, suspension and design of body being all provisionally protected. Reference to the illustration previously published will show its special construction

**Ariel Decompressor.**

The exhaust cam A and decompressor cam B are arranged in parallel planes, the former acting through a rocker C as usual. The decompressor rocker D is pivoted at its centre on the rocker C, and is provided with a beel F engaging a cam G, which is provided with a recess H as shown. This cam G

can be moved into either of two positions by the lever J and rod and pedal mechanism K, the latter being held against stops LM by a spring N. The decompressor rocker D is provided with a coil spring O at its pivot, which normally moves it into the position shown. It will be seen that the heel of the

rocker D lies within the recess H in the cam G, raising the operative end of the rocker out of the path of the cam B. This is the position for normal running, the rocker D being clear of the cam. To obtain the reduced compression, the mechanism K is moved to rotate the cam G to a position in which the recess is moved from beneath the heel of the rocker D, causing this to be raised against the action of its spring O, and depressing its operative end into the path of the cam D, causing the rockers C and D to be lifted by the cam B, raising the valve tappet P, and allowing part of the charge to escape in the well-known manner. The ordinary exhaust valve lifter is shown at R. This is operated in the usual way.—C. T. B. Sangster, No. 22,475, 1911.

**SPARKLETS****Decompressors.**

Arrangements have been made whereby the Endrick Engineering Co., Warwick Road, Olton, Birmingham, have become sole concessionaires for Guest's Patent Decompressors. A special short pattern is marketed for Ridges and Bradburys, and for fitting in lieu of a compression tap in the centre of the cylinder head. The makers do not

recommend it for cylinders of less than 350 c.c., but for this and larger sizes it gives good results in the matter of easy starting and slow running. We have one in use on a 4 h.p. single-cylinder engine, and find the results warrant the fitting of it both for starting and slow running on top gear.

**Tyres Cheaper.**

Since September 16th the prices of tyres manufactured by Messrs. George Spencer Moulton and Co., Ltd., have been reduced.

**3½ h.p. B.S.A.**

The B.S.A. machine is of 3½ h.p., and only one size of engine is made at present. Owing to a slip E. Clissett, who won the Cowbridge and District M.C.C. hill climb, was stated to be riding a 5½ h.p. B.S.A., and this has led to a number of enquiries being received by the makers.

**Trade Announcements.**

We understand that E. A. Colliver, a well-known amateur, has joined Messrs. Godfrey and Applebee, Ltd.

B. Alan Hill, a successful rider of Rudge and latterly Indian motor bicycles, is shortly going into partnership with D. S. Parsons in the motor cycle and sidecar business at Squirrel's Heath, Romford. The firm has arranged for the exclusive agency in Essex for Rex and G.W.K. cyclecars, and Quadrant, Rex, and Corah motor cycles.

**"The Motor Cycle" Photographs.**

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates:—  
Unmounted prints, half plate, 1/6 post free; mounted, 1/9 post free. This refers only to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

# LODGE PLUG ?

One reason is probably that the owner is a discerning rider and knows a good sparking plug when he sees one.

Again, it is now widely known amongst motor cyclists that a Lodge Plug is so designed as to develop just a shade **more power** than can be obtained with any other plug made. And engine power is what they want.

Suitable with all magnetos on all motor cycles, the Lodge Plugs are English made, and are obtainable everywhere.

Price 4/- each.

## Take care!

You should use the same care in deciding WHERE to buy, as you do when choosing WHAT to buy. It is imperative that the Agent who sells you a Motor Cycle should have a specialised knowledge of its construction—otherwise you cannot be assured of that efficient "Service" which is so necessary :

## You get service—

if you buy your machine from us—immediately you become a purchaser of our staff and works are at your service. :

Any dealer can sell you a machine, but has he the works, equipment and staff to always effect any replacements or adjustments you require? :

For years we have specialised in Motor Cycles, and it is our interest that every client's machine should be 100 per cent. efficient. We always carry a complete stock of spare parts for machines for which we are Sole Agents, and our clients are thereby saved any irritating delays.

We have now in stock the following 1912 models: "Triumph" (Free Engine, T.T. Roadster, and THREE SPEED); Rex-J.A.P. (6h.p. de Luxe, "The ideal Sidecar machine"); Scott two-stroke; 6 h.p. Zenith Gradua; Premier (3½ h.p. 3-speed); Hazlewood-J.A.P. (2½ h.p. 3-speed); Rex (6 h.p. 2-speed); N.S.U. (3½ h.p. 2-speed).

\*\*\*\*\*

## Real Bargains—

We have a number of new slightly soiled 1912 models to offer at special prices—also a good stock of Second-Hands—Write for list.

CASH, EXCHANGES, or EASY PAYMENTS. :

The Premier Motor Co., Ltd., ASTON ROAD, BIRMINGHAM.

Telegrams: "Primus, Birmingham." Phone: Central 4310.

ESTABLISHED 20 YEARS "IN THE HEART OF THE TRADE"

Before the T.T. Race we had the highest opinions of the future of the Scott motor cycle, and we advertised in these columns before the race that we placed very high the chances of the Scott. Moreover, we backed our fancy by placing before the T.T. Race an abnormally large contract for 1913 Scotts. Our anticipation was justified, now and all next season Scotts will be in enormous demand, and we shall be one of the few firms who can supply. Big as our contract is, we expect it to be much below the possibilities of our sales, so we recommend our customers to order early.

## Book now, at the Colmore, to get your 1913 Scott early.

Remember the wonderful record of the Scott in T.T. Races, showing power and speed, and in the Six Days' Trials, showing reliability.

Exchanges, or any other special terms, can be arranged either by interview or correspondence.

## MOTOR BICYCLES FOR SALE

HUMBER, 1911, 3½h.p., 2-speed, handle etc. excellent condition, lamp, horn, spares; £32 Barcombe Av., Streatham Hill.

TRIUMPH, 1912, F.E., quite new, with accessories for debt; what offers for cash.—Green, side, Golder's Green Rd., N.W. [6]

RUDGE, 1912, as new, with accessories; £38.—1 Wayside, Golder's Green Rd., N.W. [6]

TRIUMPH, 1911, 2-speed free engine, almost perfect, complete with sidcar and accessories, special bargain. £39.—Below.

N.L.G., 1911, 4h.p. J.A.P., perfect, Jones and lamp, generator, horn, and spares; £32/10.—1

TRIUMPH, 1911, free engine model, lamp, horn, horn, and spares; £38.—North London age, Corsica St., Highbury, N. [6]

1½h.p. Motoecoche, accumulator, Whittle belt, good; £6 cash, or gradual.—Seen at Harvey, son, and Co's, South Woodford. [6]

2½h.p. Brown, Chatter frame, Amac carburetter, footrests, very low, good condition; £7 cash, gradual.—Seen at Harvey, Hudson, and Co's, Woodford. [6]

TRIUMPH, 1911, 3½h.p., free engine, absolute perfect condition; £36.—Apply Harrington, dealer, Wood St., High Barnet. [6]

3½h.p. 1912 Auto Motor Cycle, Amac carburetter, 2 justable pulley, splendid running order; £216.—106, Trafalgar Rd., Old Kent Rd. [6]

TRIUMPH, 1910, splendid condition, P. and H. horn, new back Michelin; £32.—Box 1152 Motor Cycle Offices, 20, Tudor St., E.C. [6]

DOUGLAS, standard, June, 1912, Brooks, Dunlop back, good lamp, horn, spares, tools, quick sale.—1, The Green, Eltham, Kent. [6]

£8/10.—De Dion, Chatter frame, brass torpedo to and B. h.b.c., Helios ignition, tyres perfect fast.—Ashburnham, Litchfield Rd., Sutton. [6]

TRIUMPH, 3½h.p., 1909, excellent condition, ometer, Brooks pan saddle, lamp and gear £25.—Rogers, 42, Church Rd., Hendon. [6]

T.T. Rudge, new September, very fast, horn, and 1913 Sensap carburetter, new tyres; £25.—son, 3, Church Rd., Bengoe, Hertford. [6]

1912 Centaur, 2½h.p. twin, like new, £31/10; featherweight, £25, excellent condition, roughly overhauled.—21, Holborn Viaduct. [6]

DOUGLAS, 1911, new condition, lamp, gen horn, and spares, new 2½ Dunlop and tube on £25.—2, Upper Roman Rd., Chelmsford. [6]

DOUGLAS Lady's Model, excellent condition, used, 2 speeds, free engine, all accessories; Apply, John Turner, engineer, East Hothly. [6]

1912 T.T. Rudge, all accessories and tools, in condition, very fast; £38; must sell; buying car.—Preece, Cock Hotel, High St., East Ham. [6]

2½h.p. Mag. Lightweight, Bosch, B. and B., full adjustable pulley, spring forks, tyres and a nice good; £15.—49, Griffin Rd., Plumstead. [6]

MUST Sell.—1911 free engine Premier, with a out sidcar; first offer; splendid condition No. 1530, The Motor Cycle Offices, Coventry. [6]

TRIUMPH, 1912, 3½h.p., free engine model; delivery; £55, cash, or deferred payments. Barker and Co., Kensington High St., W. [6]

PHELON and Moore, Ltd., 4, Percy St., W. several 2nd-hand P. and M.'s for sale; part on application, or can be seen at above address. [6]

1912 T.T. Rudge, very fast, B. and B. carb knee grips, h.b.c. mag., competition winner or good offer.—Homestead, New Thundersley, Essex. [6]

SINGER, 2½h.p., 1912, 2-speed; owner gives doctor's orders; £35 nett.—To be seen, Black Motor Works, 165, Shooter's Hill Rd., S.E. [6]

2-STROKE 3½h.p., late refinements, mag., V. Mahon; ride 20 miles enquirer; £20; ex lower power.—Pink, Wrotham Rd., Gravesend. [6]

F.N., 4-cyl., central intake, B. and B., foot Stewart speedometer, in splendid condition nearly new; £20.—104, Camberwell Grove, S.E. [6]

1912 Chatter-Jap, 3½h.p., Bosch enclosed, B. do 60, insured to April, disposing of illness; £25.—Grimes, 14, King St., Chertsey. [6]

£7/10.—6h.p. twin Sardinia, good condition, requires overhauling, and must sell.—Walcot Coleraine Cottages, Fortis Green, E. Finchley. [6]

SCOTT, Oct., 1910, just overhauled, £35/10 ford torpedo sidcar, 1912, £5/10; mag. part.—111, Walton Rd., East Molesey, Surrey. [6]

TRIUMPH, 1912, free engine, condition perfect miles only; forced sale; seen Dover; £4 L158, The Motor Cycle Offices, 20, Tudor St., E.C. [6]

£8, bargain.—2½h.p., spring forks, good tyre seat, footboards, battery, strong frame, 1 engine.—319, Upper Richmond Rd., East Shee [6]

1910 Triumph, Palmer and heavy Kempe new, new belt, exhaust whistle, extra mud first cheque for £24 has it.—33, Killyon Rd., C [6]

## Cyclecar Definition.

OUR contemporary, *The Autocar*, in its current issue, asks the pertinent question, What is a Cyclecar? Those who have read the R.A.C. and A.C.U. definition of the miniature motorcar might be inclined to reply that the resolution passed by the joint committees of the two bodies referred to answered the question. This definition is that a cyclecar is a motor vehicle, the chassis of which does not exceed 6 cwts. unladen, and the engine of which has a cylinder capacity not exceeding 1,100 c.c. The question is, does this definition cover all vehicles of the motor cycle class?

Apparently not, for we have had vehicles competing in sporting events and trials, which, although they have not exceeded the chassis weight mentioned above, have been much more than cyclecars when the total weight is taken into account. This is where the incompleteness of the definition comes in, because it is inconsistent to fix a chassis weight of 6 cwt. and allow unlimited body weight and seating capacity. Granted the A.C.U. committee added a rider to the original resolution which prevented a vehicle exceeding 7 cwts. total weight from competing in their events, but it is only effective in the case of vehicles of which the bodies are inseparable. We should like to ask to what vehicle this clause applies, for we have yet to find a motor car from which the body cannot be removed. This rider, by the way, has never, so far as we are able to trace, been confirmed by the committees of both the R.A.C. and A.C.U., therefore the correct and only definition existing which may be called, so to speak, "legal," is the 6 cwt. chassis ruling and 1,100 c.c. capacity. This brings us to the question, "What is a chassis?" Everyone conversant with motor matters knows that the definition of the French word "chassis" is a motor car minus the "carrosserie"—*anglice* body and upholstery. No British organisation has laid down any definite ruling as to what does or does not constitute a chassis. It is, however, interpreted by *The Autocar* as a motor car with tyres and all tanks, but minus body and wings. Some makers to this day quote prices for a chassis and state that the figure is without tyres, others include tyres but not wings, and still others do not include the dash if the latter be of wood.

Until some definite ruling be instituted the word chassis may be interpreted according to the maker's desire. The Manufacturers' Union has accepted the

R.A.C. and A.C.U. ruling of a 6 cwt. chassis, and no vehicle exceeding this weight can be exhibited at the cycle and motor cycle show next month. It will be interesting to see if a maker whose voiturette chassis exceeds 6 cwts. will be allowed to remove such articles as the dash, wing supports, and running board irons, etc., to reduce the weight to the limit, or whether these parts must be calculated in the total. It should not be left to the discretion of the show management to give decisions on such an important point, and we suggest that the R.A.C. and A.C.U. should forthwith define a chassis once and for all.

This brings us to the question of what is a cyclecar from the point of view of a purchaser. If the prospective buyer see at the car show a little car the weight of which (chassis) is 6½ cwts., he will not give up all intention of buying it because it exceeds the R.A.C. definition. He will buy it if he can afford it. The weight definition will not concern him. Taxation is far more likely to be a deterrent unless he find that he can use a single-cylinder 7 cwt. four-wheeler for a less tax than he can own and use a motor bicycle and sidecar with a twin-cylinder engine, which is the absurd position of the taxation question at the moment.

One thing is certain: there will be no sharp line of demarcation between the present owners of motor cycles and cars and those who now own, or intend to own, cyclecars. No new species of motorist will be created because the chassis weight of the vehicle used does not exceed 6 cwts. The motor cyclist who sells his motor cycle and sidecar and buys a little runabout will not call himself a "cyclecarist." The policy of this journal has been to cater for motor cyclists, and knowing as keen riders the interest taken in small runabouts by motor cyclists, we shall continue to place before our readers descriptions and illustrations of any light vehicles of new design.

*The Motor Cycle* will be the complete paper dealing alike with the motor bicycle and the motor cycle passenger machine. Occasionally we shall, perhaps, overstep the hard and fast line set down by the governing bodies, but that will make the paper no less interesting.

Makers of "cyclecars" will also take care that no strict definition is adhered to for long, and will not be any more bound by arbitrary regulations than we intend to be. Everything which interests motor cyclists will be the policy of the journal which has been the motor cyclists' paper for nine years without intermission.

# The Low Forced Induction Engine.

**T**HE ingenious experimental forced induction engine invented by Dr. A. M. Low, D.Sc., was fully described and illustrated in *The Motor Cycle* of February 29th, 1912. This was attached to an early type of runabout. The engine we now describe has been much improved and has been made by F. E. Baker, Ltd., Birmingham.

Fig. 3 is a section of the engine, which has a cylinder of 70 x 130 mm. Petrol is delivered by the pump K (fig. 2), driven by the eccentric L, and an intervening rocker into the petrol jacket O (fig. 3), which almost encircles the cylinder. The heat of the cylinder converts the petrol into vapour under very high pressure, and it issues from the jacket into the transfer pipe V (fig. 3), and by the passage U (fig. 3), through the rotary valve, and thence by the part X into the combustion chamber. The rotary valve W (fig. 3) is timed, and does not admit vapour until the piston is at the top of the compression stroke. As the piston descends on the induction stroke the mechanically operated overhead valve Y opens and pure air is drawn in. This, then, is compressed, and the valve W is then timed to open at the moment of highest compression, at which moment the spark takes place and continues during the early portion of the stroke.

The exhaust valve Z (clearly shown in fig. 3) is operated in the usual manner. This represents the cycle of operations. The petrol pump (fig. 2) is provided with a pressure controlling arrangement. There is a pipe Q leading from the petrol jacket to a valve above the petrol pump, the tension of which is controlled by the screw compressing the spring P<sup>1</sup>. In the event of the pressure in the jacket being too high, any excess of petrol passes through the ball valve in the by-pass R back again to the tank.

Fig 1 shows the lubrication arrangement. There is a sump C, at the bottom of the crank case, from which oil is raised by the pump A, driven by the eccentric B, which is in turn driven by the chain E from a sprocket on the main shaft. The oil passes from the pump up the pipe F, and is distributed to the rotary valve I, and thence from the other side of the valve to the bottom of the cylinder by means of the pipe J. On its way to the valve the oil branches off, and is forced in two directions at once, not only to the valve, but also to the main bearings.

The dynamic compression whilst running shown on an indicator is 500 lbs. to the square inch, while the static compression—that is calculated from the compression ratio—is 260 lbs. to the square inch.

It will be noticed on referring to the drawings that the petrol jacket is carried round the lower portion of the cylinder, as it has been found that when the jacket is over the cylinder head, as was the case in the earlier model, the pressure rose too quickly. An interesting point is that the piston comes up to a point within  $\frac{3}{8}$  in. of the top of the cylinder, thus scavenging the cylinder almost completely.

While the petrol gas passes down the slot leading to the combustion chamber, at the moment determined by the hand controlled rotary valve, it thereby cools itself, but its temperature on entering is immediately raised by the gas passing the flame of the plug, which sparks continuously during the early part of the stroke. The gas burns slowly at first because the air is compressed to only about 80 lbs. to the square inch, and no ignition takes place until the explosive mixture is formed. If the pressure of air be about 150 lbs. to the square inch (depending upon what fuel is

- 1 & 2 Levers controlling Rotating sleeve, operated by Bowden wire

**Low Forced Induction Engine.**—  
ed), the theory of stratification becomes more correct, and  
e gas at entry is so cooled by expansion that no actually  
plosive mixture is formed at once, but explosion takes  
ee between more or less local particles, on their tempera-  
re being raised to ignition point by the spark.  
The rotary valve is provided with two sleeves, which can  
operated by means of Bowden wires. One sleeve works on  
quick thread, and slides longitudinally if rotated, and is  
vided with a helical slot covering the actual gap in the  
lve. Another sleeve when rotated opens or closes this gap  
means of an annular slot, so that not only can the timing  
the valve be varied, but the petrol gap can be cut off  
together or opened to the fullest extent.  
The control is entirely by means of this rotary valve, and  
is interesting to note that the slot in the valve itself is  
ceedingly small. The valve is driven by means of a chain  
f the mainshaft at half the engine speed. The annular  
lve sleeve, possessing a longitudinal helical slot which  
ves a variation in timing, may be used in the same manner  
a spark lever. The second annular sleeve has a triangular  
e cut round it, so that by bringing different portions of  
e slot opposite the valve, the amount of opening can be  
ried at will. Driving fast on the level one would naturally  
mit just a suspicion of gas very early, expansively, just  
a locomotive driver links up his engine as the tractive  
ort eases off after leaving a station. To climb hills, one  
mits the gas late, and allows it to enter for some period  
the stroke, thus maintaining pressure on the piston  
roughout the length of the stroke.  
As a more or less continuous spark is necessary a high  
eed trembler coil is employed. Experiments, however, are  
ing made with an alternator, so as to do away with the

necessity of carrying accumulators. The fact that the engine  
is water-cooled, especially round the valve, and the fact that  
the valve is lubricated by oil under pressure, render the  
working of the latter possible, while further to ensure the  
absence of leakage, rings are cut round the sleeves and valves  
to ensure an ample supply of oil and thus prevent leaking of  
pressure. Most details of the engine are quite ordinary, the  
crank case is of steel and very deep, while all moving parts  
are made especially strong. No ball bearings are employed,  
the main bearings being of ample size.  
In the case of the old model a carburetter was used for the  
initial starting efforts, but with the aid of a quarter com-  
pression device starting is rendered quite easy, if a little  
petrol be injected into the rotary valve and is allowed to be  
sucked in with the air. This will permit the engine to run  
on the four-cycle system as long as the petrol lasts. In the  
meantime the engine becomes warmed up, and when the  
quarter compression lever is released the engine runs on the  
Low cycle.  
The petrol gas is at a pressure of about 1,000 lbs. to the  
square inch, but the spirit evaporates so quickly that the  
pressure is never constant, and if the safety valve be used as  
soon as this is opened pressure drops immediately. If, how-  
ever, the valve is screwed up the pressure regulates itself to  
a certain extent, causing re-condensation. The exhaust valve  
will probably be a piston in future, but at present it is of the  
ordinary type, but probably our old friend the concentric  
double exhaust valve will be employed. This, our readers  
may remember, consists of an ordinary exhaust valve with a  
small valve in the centre, which is timed to open slightly  
before the main valve, thus allowing part of the exhaust to  
escape and presenting a small area of resistance against the  
exit of the gases, after which the main valve opens in the  
ordinary way.

# A 1913 Pattern Binks Carburetter.

**M**R. CHARLES BINKS is about to introduce a  
new carburetter which he terms the optionally  
automatic carburetter. That is to say,  
though the carburetter can be used entirely auto-  
matically, yet an adjustment is provided by a second  
ver by means of which the mixture may be either  
rengthened or weakened to suit the varying condi-  
ons such as occur in hill-climbing or very high speed  
ork.

## A Spring Steel Shutter.

In most respects the new carburetter resembles the  
12 automatic type, for it has two jets and choke  
bes which are in turn uncovered at the correct instant  
y a single piston throttle. This piston is now  
versed, and opens downwards instead of upwards.  
he main alteration, however, lies in the shutter 6,  
hich is made of spring steel and lies above the main  
t 1. Normally this shutter should be about half-  
ay open, and such a combination of jets used that  
e engine will accelerate quickly when the main jet  
omes into play. It may then be used as an automatic  
rburetter in the usual way. Should a corner be  
ountered or a steep hill, the shutter may be lowered,  
us increasing the velocity past the main jet, or, on  
e other hand, if very high speed be required the  
utter may be raised, thus lowering the velocity.  
he shutter is controlled by a lever on the handle-  
ar, which should be marked in its mid-position, so  
at the rider can always return the shutter to its most  
efficient automatic position.  
Mr Binks points out that the carburetter has been  
duced solely for hill-climbs and for those who do  
ot yet believe in the automatic carburetter. He points  
ut that after much experience he finds that the second  
ever can only be of advantage in a competition hill-  
limb or for racing work. He will, therefore, continue

to market his present type of single lever carburetter.  
Both these types are made also in a lightweight size,  
and either as shown or inverted.

The Binks optionally automatic carburetter.

# RUDGE 1913 MODELS.

A 750 c.c. ENGINE FOR SIDECARS AND CYCLECARS.

1913 model T.T. Rudge.

Belt side of the new Rudge Multi.

**T**HE new model Rudge motor bicycles have undergone very little change for 1913, which will cause no surprise, seeing that the machines have been eminently successful during the present year. A sidecar model is a new departure for the company, and another new vehicle to be shown at Olympia is the Rudge cyclecar, though the complete machine is not yet ready. We are, how-

ever, durable than any kind of phosphor bronze bearing. The construction of the bearing makes it especially easy for oil to get in. A new design of piston has been adopted for 1913. There is a ring at the top and bottom with a recess in the piston wall, which not only reduces weight to a minimum, but also ensures a film of oil in the path of the rings. The riveting up of the engine flywheels is nearly twice as strong as last year, we are assured, and the timing wheels are almost doubly as strong as they have been hitherto. Special attention has been paid to air release, there being four points at which compressed air may escape. The new pattern Senspray carburetter is a standard fitment. This carburetter, it will be remembered, is of the "straight through" type. Ruthardt magnetos will be used in addition to the Eisemann, which has been standard during 1912. It goes without saying that the Ruthardt has been selected after exhaustive tests.

## Waterproof Hubs.

One of the main defects of motor bicycles which the wet summer has disclosed is the bad effect of wet on the front

cones. To overcome this a new type hub flange has been adopted, which drains all the water that runs down the spokes away from the entrance to the cups, and, further, these cups are protected by dust caps. The front brake and front mudguard stays are now placed entirely outside the mudguard. In the iron brake the shoes are pivoted midway along the links, which are pulled up the fork; this gives increased leverage. The 1913 Multi has been improved in detail throughout, and the twenty-speed gear has been rendered thoroughly weatherproof. The rear side the mudguard. In the front brake steel, ensuring concentricity, balance, a uniformity of material. A new design flange enables spokes to be used with or without a small bend in them, and it is claimed that the possibility of broken spokes, either wheel has been entirely eliminated. On the front fork large grease cham-

Method of fixing timing wheel on serrated shaft.

The 750 c.c. Rudge engine, which in 1913 will be used on Rudge cyclecars and sidecar machines.

ever, able to illustrate the power unit, and to state that it will be of very light construction, incorporating belt drive and a variable pulley gear.

In connection with the two types of engines for 1913, these will be fitted with specially designed roller bearings to the crank pin and gudgeon pin as it has been found that at high speeds this type of bearing causes far less friction and is more

The Rudge sidecar combination, to be supplied complete next year.

Rudge 1918 Models.—

Rudge small end roller bearing with one thrust plate removed.  
provided to each pair of shackles, though they are not, of course, visible to the eye.

**The 750 c.c. Engine.**  
A big single-cylinder engine has been specially introduced for passenger work, the Rudge is a popular sidecar machine. The engine is illustrated on page 1194, and it will be gathered that it is on exactly similar lines as the 85 x 88 mm.

part of the trussed sidecar frame and mudguard fixing.

engine. The 750 c.c. engine has a stroke of 132 mm., the bore remaining 85 mm. Of course, heavier flywheels are used. By careful designing it has been possible to mount this engine into a standard frame as far as the height of the top rail is concerned, but to give sufficient clearance the

tank tube has been slightly deflected and the tank recessed for the overhead inlet valve mechanism. This big engine will be fitted to the sidecar model and also on the new cyclecar. It may be obtained with either clutch or the Rudge multi-gear. It is worthy of mention that the sidecar model has a larger tank capacity, which is appropriate to the larger cylinder capacity. We are told that the 750 c.c. engine is exceptionally powerful on hills and has succeeded in taking three up Sudeley Hill, near Winchcombe.

**The Sidecar Chassis.**

This chassis, like all Rudge productions, has been carefully thought out from A to Z. It has been tested all the year and improvements which suggested themselves at once carried out. Four-point suspension is adopted, the fourth point attachment being at the footrest. It will be remembered that we recommended all sidecar users to have a similar attachment fitted to their machines for their own safety.

Latest Rudge Piston.

on the same lines as the Rudge-Whitworth motor car wheels; that is to say, the outer row of spokes are inclined at a considerable angle, thus giving lateral stability. The hub flanges are also flared to prevent the water running into the bearings. The attachment of the mudguard is an instance of the care in design. A round stay is used fore and aft coupled direct to the side tube, and in the centre the guard is steadied by a duplex steel member embracing the crown of the mudguard both inside and out. The chassis, it will be observed from the photograph, is of the underslung type, the main tube being about four inches below the centre of the wheel. The diagonal tube connecting the left side member with the right side member is worthy of notice. Two long leaf springs are used curved at each end, and shackles are also provided. The coach-built body is of up-to-date design and affords a most comfortable seating position. In general design it resembles a swingboat

Device for adjusting the magneto timing invented by A. H. Hunt, of A. H. Hunt, Ltd. By means of the ratchet device the timing can be gradually advanced or retarded without interfering with the locking arrangement on the armature spindle. The operation can be performed without the use of tools.

**CHATER-LEA CYCLECAR.**

The new Chater-Lea cyclecar, which will be seen for the first time at Olympia, will rank among the first-grade vehicles of this type. Two models will be shown, one fitted with an air-cooled engine and the other with the new Chater-Lea water-cooled engine, which, except that the cylinders are water-cooled, is similar to the air-cooled type. The bore and

A new design of 8 h.p. twin water-cooled engine by Chater Lea, Ltd., and intended for use on cyclecars.

stroke are 85 mm. The exterior finish is remarkably good, and the engine appears to be a very neat job. The new cyclecar will be provided with a channel steel frame, while the transmission through the Chater-Lea three-speed gear box and worm driven back axle, which have proved their worth during the present year, will be retained.

**A FLEXIBLE BELT.**

A new rubber and canvas belt of wonderful flexibility is the Clincher introduced by the North British Rubber Co., Ltd. The belt has grooves both top and bottom, the design of the top rendering the belt very flexible. The small round indentations are

intended as an indication where to bore the belt for a fastener screw, so as to ensure that the hole is punched through the thickest part of the belt. The size, 1 1/2 in., too, is a point of note, the makers contending that this size will better suit a 3 in. pulley than the ordinary 3 in. belt does, for it is well known that a belt wears and stretches after continued use and drops lower in the groove.

Chassis of the Rudge sidecar, showing long leaf springs.

# Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

## How to Improve Acceleration.

**Q.** (1.) I should be greatly obliged if you can tell me what (if anything) I can do to improve the picking up of my machine, which is a four-cylinder F.N., automatic carburettor. When running at 15 m.p.h. it is all I could wish, but after closing throttle and slowing to 6 m.p.h. it is very slow in picking up when again opened. (2.) What is the correct petrol level in jet? (3.) How can I ascertain that level?—NOVICE.

(1.) You must be careful not to open the throttle too suddenly. Opening the throttle in this way tends to choke the engine. You might also try fitting new inlet valve springs. (2.) The correct level is about  $\frac{1}{16}$  in. from the top of the jet. This can be ascertained by removing the jet and fitting a dummy jet, in the shape of a tube consisting of a piece of copper pipe of the same size as the ordinary jet, in which the level can be clearly seen.

## Speed and Gears.

**Q.** (1.) I am rather puzzled by your gear ratio speed, page 148, "Motor Cycles and How to Manage Them." Take one line—Ratio . . . Speed with of gear. . . 26 in. wheel.

3 to 1 . . . 51.5  
What is 51.5? Are they miles per hour? If so, the largest gear, say, 12 to 1, seems to go slower than the smaller one. (2.) Running up hill 1 in 10 you say— $\left(3 + \frac{0.05}{\text{B.H.P.}}\right)$  to 1. Does this mean  $0. \times 05$  divided by horse-power, and, if so, say horse-power is  $2\frac{1}{4}$ , would it be  $3 \frac{1.45}{1}$ ? (3.) I have a  $2\frac{1}{4}$  h.p. Minerva, second-hand, just overhauled, which, on the level, will take gas and air all right, but up hill the trouble begins. The gear ratio (measured by me, according to your book) is 1 in 5. Is this too high; if so, what do you recommend?—E.M.

(1.) The speed is, of course, in miles per hour. Naturally, a gear of 12 to 1 will give less speed with the engine turning at the same number of revolutions per minute. A gear of 3 to 1 means that the engine turns three times while the wheel turns once. (2.) The second formula should read— $\left(3 + \frac{.05 \text{ W}}{\text{B.H.P.}}\right)$  to 1. If we take the weight of yourself and machine to be 300 lbs. we get the following result:

$$3 + \frac{.05 \times 300}{2.25} = 9\frac{2}{3} \text{ (} 9\frac{2}{3} \text{ to 1 gear.)}$$

You cannot get so low a gear as this with a direct belt drive. (3.) About 6 to 1

will be a useful ratio. You might reduce the size of your pulley and have a larger belt rim fitted.

## An English Machine for Austria.

**Q.** I am about to buy an English motor cycle. From catalogues received I should prefer a Scott cycle, but unfortunately it is impossible for me to see one before buying. As an old motorist I have been fascinated by the excellent qualities of this original construction, and I think it has no doubt important advantages. Yet, being an eager reader of your periodical, it did not escape my observation that there seem to exist ticklish points on which one can judge by experience only, e.g., the automatic lubrication, the gas-tight joint where the mainshaft leaves the crank case, the crank case compression depending thereon, and others. I intend to make use of the cycle both for solo and sidecar purposes, and for use on very steep roads in the Alps.—Dr. N. SCHWARZ (Austria).

The automatic lubrication on this machine is quite satisfactory, but you might have a little trouble from loss of crank case compression, and the gauze of the transfer ports requires to be cleaned from time to time. We have used these machines for a considerable time at intervals since they were first introduced, and last year found the 1911 model excellent—very smooth running, silent, and altogether delightful. It was used by us over the stiffest hills in Yorkshire, in which the gradients are quite as

The above line sketches are those of the exhaust and inlet cam contours taken from a record breaking motor cycle engine. We publish them as being of interest to motor cyclists who are in a position either to make new or alter old cams to obtain improved speed results.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

bad as those in the Alps, though not course, quite so long. The water-cool should give no trouble whatever.

## Misfiring at Speed.

**Q.** Can you tell me what is wrong with my machine? My trouble is that at high speed (43 m.p.h.) my engine begins to misfire, and will not go faster except for a few moments so. I have tried to regulate carburettor, but it seems to be the same with each jet. I have tried different plugs and altering space between the points of the neto, each without any better result. I think the valves are all right, the timing is correct. I may say up to 40 m.p.h. my engine runs smoothly, and will also run quite slowly.—F.C.W.

From your description we should think the trouble lies in the points of magneto. Trim these up till they bright and meet evenly, and set them to break so that the feeler on the neto spanner is rather a tight fit, would also suggest cleaning the stems, as these may have become gummed and stick in the guides.

## Starting a Cyclecar.

**Q.** I wonder if you can help with regard to the starting of my A.C. It is a 1912 model new from the works in . . . and sometimes it is impossible to start the engine from the handle even after a dozen or more turns unless the engine is hot, when it may possibly go the first turn without a backfire. When once started the engine runs beautifully, and no trouble at all. I have been advised to start the engine by using my hand, so as to obviate the danger of backfires, but it is impossible on A.C., as the pressure is so enormous. I have just lately "cranked" a A.C. with my left hand with the greatest of ease. Can I make like that by having the magneto seen to? Do you advise me to take it to a local garage or to send it to the makers?—(Miss) M.I.L.W.

The trouble is almost undoubtedly due to a loose connection in the union between the carburettor and engine. Leaks of this kind are almost certain to prevent easy starting. We should for a moment suppose that it is necessary to send the machine back to the makers. If you will get into communication with them, they will probably give some little hints that will quite overcome the difficulty.

### Trouble with Accumulator Ignition.

\* Multi-gear on Counter-shaft.

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

## OCCASIONAL COMMENTS.

By "IXION."

**The Cyclecar Price Limit.**

I have received news which shows that the A.C.U. will shortly be forced to legislate more accurately with regard to four-wheeled cyclecars. A well-known make of four-cylinder car will be marketed for 1913 at a lower price than is now asked for several well-known quadricycles, falsely so-called. The situation will then be Gilbertian to a degree, and the present overlap between the car and cycle markets will be grossly extended.

**Humours of the Runabout.**

The cyclecar type of runabout has introduced at least one new joke into our pet hobby. With most belt-driven machines it is possible for a belt to drop off without the drivers being aware of the fact! What ingenious engineer can invent a safeguard for this annoying and expensive *contretemps*? We shall have to get belt-makers to stamp our name and address on the top run!

**Leaning In and Out on Cyclecars.**

I withdraw *in toto* my apologies to those makers of cyclecars who denied my allegation that their passengers "weatherilted" on bad corners in the trials. I had much difficulty in believing that my senses and my memory had alike deceived me, but their protests forced me to doubt myself. I have looked over my file of *The Motor Cycle* and find a picture published on August 8th in connection with the Scottish Trials, which revealed a passenger leaning in on a corner taken to the right. The manufacturers may assert that this balancing was a piece of gratuitous "swank," intended to convey an impression of sensational speed and dash to the untutored spectator; but of the fact there is no longer a tinge of doubt. I also possess several other photographs depicting the same attitudes at corners.

**Air-cooling and Water-cooling on Voiturettes.**

A new interest is added to the thorny question of runabout design by the problem of cooling. There is not the faintest shadow of doubt that air-cooling will suffice for all ordinary purposes. A light chassis, designed on hybrid motor cycle lines, and used for general work in the southern half of England, need not be burdened with the weight, cost, and complication of water-cooling.

It is, however, questionable whether some of the air-cooled motor cycle engines now fitted to cyclecars could face the arduous work of a Scottish Trial, or whether an inexperienced driver could cross London on one of them non-stop.

I notice among the projected designs for 1913 several types which are distinctly heavy, and which incorporate a deal of friction in their efforts to obtain a no-trouble transmission. These factors imply a reduction of hill-climbing speed, and real hard work in the northern half of Great Britain might prove that these designs are inefficient under special strains. At any rate, the presence of a fleet of cyclecars promises to add a spice of genuine interest to the 1913 Trials, which might have degenerated into a mere exercise canter if they had been confined to motor bicycles. Water-cooling should certainly be eschewed wherever air-cooling can suffice.

**The All-black Motor Bicycle.**

Publish it not in Gath, but I remain a devotee of the push bicycle as a local runabout. For the twelve months I have ridden an all-black machine without a spot of plating anywhere in its anatomy. Delights of the change from a superbly nickelled machine to a machine of this description. I can take the machine on all weathers, or leave it out in the rain all night, it never asks for more attention than a swill from a hose, followed by a rub from an absorbent cloth. It need never grease it down to avoid rust; I need not tire my elderly muscles by massaging it with motor polish and dusters. Why cannot I procure any make of motor bicycle I fancy in the same finish? A motor bicycle is not like a silk hat, designed to impress poorer classes of society on infrequent occasions of ceremonial. It is becoming the everyday means of locomotion for a hard riding and busy section of the community; and cleaning one down is a weariness to the flesh. There are one or two makers who black a good deal of the machine, but they are inconsistent; they give you a black handle-bar with plated corners and levers! A black hooter, with plated rings round it! A black lamp and generator, with plated knobs and clamps. But there is not a single machine (I believe) with no plating at all on itself and its accessories, and such a machine would be very popular with many of us. It is true that certain nuts and bolts cannot be enamelled or covered with a skin of black celluloid, but they might be finished in dull black; plating is very little good on nuts, as it is so liable to peel off from the corners.

Miss Mona Clease, of Shrewsbury, mounted on her 2½ h.p. Farwell motor bicycle. Miss Clease is but seventeen years old, and had had no experience of motor bicycles a month ago, but she now manages her machine skillfully in the notoriously difficult streets of Shrewsbury, and has climbed Wentlock Edge. Her costume was designed for ski-ing in Switzerland.

## HUMBER NEW MODELS.

Cone Valves on the  $3\frac{1}{2}$  h.p. Engine. Belt Guards Standard.The  $2\frac{1}{4}$  h.p. twin Humber with three-speed gear.The single-speed  $2\frac{1}{4}$  h.p. twin. Observe the rear belt guard.

**H**UMBER motor cycles for 1913 have undergone but little change—in fact, the ladies' model, the  $2\frac{1}{4}$  h.p. mount, and the  $2\frac{3}{4}$  h.p. twin remain unaltered to outward appearances except for a belt guard on the latter. The  $3\frac{1}{2}$  h.p. model is the one most altered from the present year's design, but as the forerunner of this new pattern was illustrated in *The Motor Cycle* last August, when P. J. Evans performed so conspicuously on it in the Six Days' Trials, the latest photograph will present no real departures. We may review the new features. First of all the three-speed Sturmey-Archer gear has been adopted, and also a kick starter, which, by the way, is of substantial construction. It is mounted on the right-hand chain stay, and consists of a pedal and crank operating a chain mounted on the free-wheel. An eccentric adjustment is provided to take up any slackness which may develop in the chain after use.

The rear brake appears to be exceptionally powerful, which should commend the  $3\frac{1}{2}$  h.p. Humber to sidecar users. It operates inside the groove of theummy belt rim, the long pad having a compensating device. The engine (bore and stroke  $84 \times 90$  mm.) is now fitted with cone-seated valves.

A rim belt is now a standard fitting. The question of silence has received attention. An outlet pipe extends from the silencer proper under the left foot-board, but the cut-out at present used may be dispensed with.

A neat belt guard is formed by a continuation of the rear mudguard. Though it will not keep all wet off the

1913 pattern  $3\frac{1}{2}$  h.p. three-speed Humber. Observe extension pipe from silencer.

belt it will prevent mud, etc., being flung on to the rider's back. Two stands are used, and the magneto is handle-bar controlled.

**The  $2\frac{1}{4}$  h.p. Twin.**

The belt guard is the only departure on this model, the Armstrong gear being retained. The flat-faced valves are retained, as they answer all requirements. We ourselves have used one of these models all the year, and have never experienced a broken valve. The three-speeder is a most sporting little mount to ride, and its pace is equal to many  $3\frac{1}{2}$  h.p. machines. The consumption averages about ninety miles to the gallon. One trouble has been oil leaking from the crank case joints, but in the 1913 model we understand this has been got over by the adoption of felt washers to all bearings in preference to oil rings.

We saw a  $3\frac{1}{2}$  h.p. racing machine with sidecar at the Humber Works; this is only an experimental model made to see what a well-tuned  $3\frac{1}{2}$  h.p. Humber really can do. We are assured that 50 m.p.h. can be maintained on the open road.

The Humberette we have already described.

Rear portion of  $3\frac{1}{2}$  h.p. mount, showing the neat kick-starter.

## THE B.S.A. CARBURETTER.

THE B.S.A. carburetter most of our readers will recognise as the C.A.P. under a new name, seeing that it has already been dealt with in these pages. The B.S.A. Co. have now taken over the manufacture, and are producing it in considerable quantities.

Method of operating the air and throttle barrels.

Petrol is fed to the jet by means of the usual float mechanism. The float level is set correctly at the works, and should not be altered, but if after long use it should require resetting, the operation is rendered simple by the use of a screwed float needle and a castellated nut, which may be fixed thereon in any position by means of a split pin.

The main jet is easily adjustable from the outside,

Section of the latest B.S.A. carburetter with variable jet.

and lies directly between two horizontal barrels, one of which acts as the throttle and the other as the air control. Both are normally held in the off position by powerful clock springs and opened by Bowden wire control. A slight alteration has taken place in the suspension of the barrels, which are now supported by a central bearing instead of revolving in their housings, which was apt to cause jamming. The barrels rotate in such a manner that the stream of air entering through the air port impinges directly on the jet, and so that there is always a straight through passage in the full open position there is no other obstruction to the flow of gases than the jet itself. The carburetter is made almost entirely from brass castings, and is finished in dull plating. It will be fitted to all 1913 B.S.A. machines as standard, and will also be sold as a separate unit.

## WATERPROOFING THE MACHINE FOR WINTER.

ONE of the chief drawbacks to winter riding is the amount of cleaning necessary if one wants to have a presentable bicycle for the dry season; other nuisances are hubs which persist in letting mud into the bearings, and control wires which are continually getting jammed.

This is just the right time of year to fit good non-skid tyres to the wheels.

## To Prevent Rust.

While you have got the wheels out, examine the ball bearings, and fill the races with hub lubricant. (Don't overdo this, or the overflow will render your brakes useless.) The cones should then be adjusted so that there is just sufficient slackness for the wheel to swing back after revolving slowly. After replacing tyre, cover hub, spokes, and rim with vaseline or any similar grease. (Vaseline is best applied with a paint brush.) If this be done thoroughly there should be no need to touch them again till the spring. Brake pad holders, clips, and speedometer wheels all enjoy the same

treatment. If a bicycle has been thoroughly vaselined one can safely turn a hose on it, avoiding the hub and magneto. A gentle flow of water is all that is necessary if the mud is not given time to harden. When the tyre is off you will probably find the inside of the rim very rusty. Emery cloth and a coat of enamel should prevent this happening again.

For Bowden wires there is nothing like powdered graphite mixed with vaseline for lubricating the inner wire. This is also excellent for valve guides, and the threads of valve caps, plugs, etc. A common cause of trouble with wires is that the outer casing gets nipped between the frame and the spring forks, when the wheel is turned right round.

The coil springs of fork and saddle are always difficult to clean, and therefore require a plentiful application of vaseline.

After hosing down a bicycle, the enamelled portion should be rubbed with a wash leather, and a visit next morning will show where you have forgotten to vaseline.

### The Springing of Motor Cycles.

Sir,—If "Springus," or anyone looking for comfort in motor cycling, should be coming Southampton way, we could give them a ride on a machine with the fittings we think they are looking for, viz., our new ball spring suspenders, patent No. 30352, on which we have done some 4,000 miles. We are not in a position to turn out complete machines fitted with this device, but we should be pleased to fit a set to a few machines, pending the arrangement with some firms for manufacturing or increasing our plant for this purpose.

RELIANCE WORKS CO., LTD.,

F. SOUTHARD, Manager.

### Amateur Police Traps.

Sir,—I have followed with some interest the correspondence re action proposed to be taken by sundry cyclists in Manchester, with regard to timing motorists and laying information against those found driving in excess of the speed limit. While very rightly pointing out the impertinence of a Mr. Burrows, who is apparently the ring-leader in the matter, you seem inclined to suggest that the Cyclists' Touring Club are not officially concerned in the matter. Now, I have before me a current issue of the *C.T.C. Gazette*, and on pages 387, 388, and 389 is given a very full report of this same matter, and it is stated that Mr. Burrows is hon. secretary to the C.T.C. District Association, and that his proposals were submitted to a "conference of members of the local association of the National Cyclists' Union and Cyclists' Touring Club," approved by the hon. consulting solicitor to the Manchester District Association of the C.T.C., and it was resolved by the meeting "to submit the scheme, fully recommended by the Conference, to the members of the organisations represented for approval and further action."

In face of the above, I consider that it is the duty of the motoring press to keep this matter very closely under observation, and if any official approval is given to such proposals, to give it the greatest publicity amongst motoring members of the C.T.C., so that their resignations may go in *en bloc*, as it is manifestly wrong for motorists to support any concern which directly or indirectly lends itself to the furtherance of the already severe persecution to which motorists are subjected.

J. STUART WHITE, Member of C.T.C.

### Novel Interpretation of Competition Rule.

Sir,—I think the following instance of the manner in which rules are sometimes stretched to an extraordinary degree will be of interest to some of your readers.

On September 15th, the Hunslet Motor Cycle Club held a 200 mile reliability trial in which I competed with my 5 h.p. A.J.S. and sidecar and won. I was surprised to hear a few days afterwards that I had been objected to on the grounds of having received assistance from my passenger in the repair of a puncture in my sidecar tyre.

The question came up for decision at a meeting of the club on October 3rd, and I was duly disqualified under a rule—the only rule they had, by the by, for the control of the competition—which consisted of a resolution passed at a meeting of the club a few days before the trial, to the effect that the sidecar passenger should not be allowed to drive in the competition. How such a rule can be held to cover assistance in repairing a puncture passes my comprehension. Such an interpretation is truly Gilbertian in conception, to call it childish would be an insult to the intelligence of a child.

As indicating the highly judicial manner in which the subject was treated, I should like to quote one remark which was made during the discussion—it was that "the fact of turning the wheel round to locate the puncture is in itself driving." After that I am sure you will not be surprised at the decision arrived at. I may add that I have no knowledge as to whether such assistance is usually barred in such competitions or not, as it is my first experience of motor cycle club competitions, and, if this be a fair sample of what takes place after them, I think it will be my last; but I am told that such assistance is always allowed unless specifically prohibited in the rules.

H. G. BOWES.

### A Suggestion to Olympia Exhibitors.

Sir,—Re the coming motor cycle show. I should be much obliged if you could suggest to the authorities that the attendants at the various stands should be distinguished in some way, either simply as "attendant" or with the firm's name, say on a button. I have sometimes wasted much time in trying to pick out a representative of a firm on a large stand when a number of people were on it. I have also greatly offended some visitors by asking them if they were on the staff of a firm.

ERNEST E. ALLEN.

[This suggestion has already been made by *The Motor Cycle* to the secretary of the Motor Cycle Manufacturers' Union.

Several well-known firms already use a distinguishing badge.

—Ed.]

### A Rejuvenated Tricar.

Sir,—Enclosed you will find a photograph of my 6 h.p. water-cooled Centaur with alterations made by myself. I think I have greatly improved its appearance and that it is now quite a smart looking turnout.

I have turned the forecar, which was open, into a closed coach-built front, with wind screen and door, only adding

George E. Oake's modernised Centaur tricar described in accompanying letter.

about seven pounds to the machine's weight by taking other parts off. I am a keen reader of *The Motor Cycle*, and send this photograph for your approval to be reproduced in a future issue of your magazine for the benefit of any reader who may wish to make improvements on similar lines.

GEORGE E. OAKE.

### The Weights of Cyclecars.

Sir,—We notice that "Ixion" makes the statement that a certain cyclecar was permitted to run in both the Scottish and English Six Days' Trials which weighed well over 11 cwts. minus its passengers. As we were the only manufacturers who apparently had sufficient faith in their machines to enter them for both these trials, it is obvious that his remarks refer to us, and we must take this opportunity of pointing out that his statement is not correct.

The only report where we have seen this weight given is in *The Motor Cycle* of August 22nd, under the heading of "Weights of competing machines fully loaded with fuel, etc.," and which should also have read "with passengers." This same list gives a bicycle and sidecar as weighing 7 cwts. 2 qrs. 7 lbs., and an A.C. as weighing 8 cwts. 3 qrs. 19 lbs., and a Morgan as weighing 7 cwts. 3 qrs. 17 lbs. We should imagine that no one reading this list could have formed the conclusion that this was the unladen weight of these machines without passengers. Consequently at the time we took no steps to correct this list.

Since "Ixion" seems to doubt the possibility of our car being a cyclecar, for his information we may say that the body of this particular car was removed before the Taunton Reliability Trials, and the chassis weighed separately, when, of course, it complied with the regulations.

G.W.K., LTD.

[The chassis of the G.W.K. in the Taunton Trials weighed 5 cwts. 3 qrs. 27 lbs. It is quite true that the weights previously published included passengers, though this was not made clear to us at the time.—Ed.]

### Belt and Chain Transmission.

Sir,—I note that several of your readers are criticising my letter *re* belt drive, which you published a week or two back. One of them, Mr. Huntley, gently hints that some of my troubles were caused through bad driving. In reply to this, I would say that I have been driving a motor bicycle for the past six years, so that I hardly think I can be classed as a novice.

I do not say that all belts are bad, but what I do say is that it is all a matter of chance whether you get a good one or a bad one. For example: Early in the year I ran a certain belt 2,000 miles, half of it with a sidecar. During this time my belt only broke once. A friend of mine, using an identical belt for solo work only, used it for 880 miles, when it fell to pieces absolutely worn out.

Again, a week or two ago one of your correspondents stated that a certain belt lasted him 2,500 miles. I purchased one of these belts this summer. At the end of 900 miles the rubber began to peel off the canvas, and, after 1,300 miles, the belt pulled through with monotonous regularity. It was not worn out, it simply collapsed. A leather belt is certainly stronger and grips well in wet weather, but in muddy or dusty weather it collects the grit and grinds the pulley into a beautiful hollow shape and then the slipping begins. A leather belt is also very dirty to handle.

If you have the good fortune to get a really good rubber belt, I agree with your correspondents that it is hard to beat it, but however careful you are in your selection it is really a lottery and you "never know your luck."

E. K. WYATT.

### The Motor Cycle in Ceylon.

Sir,—I enclose photograph of my wife and self. My wife has just taken to motor cycling after having owned and driven cars for over six years, and still owns one. She declares she was less tired on her first run of twenty miles on her Douglas than had she been driving a car. Personally, this is also my experience—especially when one has to deal with bad roads one feels it less on a motor cycle as one can pick one's track.

Ambalangoda. CHAS. NORTHWAY.

### Motor Cycle Taxation.

Sir,—Enclosed please find six signatures to the protest against alteration of taxation of motor cycles. I consider you are doing all motor cyclists a great service by your valuable paper, and especially in taking up a matter of this sort. Wishing you and ourselves every success.

R. S. DARLINGTON.

Sir,—As an intending purchaser of a motor cycle and sidecar, I have pleasure in sending you herewith my signature for the petition against the proposed increased taxation of motor cycles. If the threatened tax be imposed I shall not purchase, as I do not see my way to pay such a preposterous tax. I wish you every success, as I am convinced that, should the tax be imposed, it will throw many men engaged in the trade out of employment.

R. F. BALL.

Sir,—I always doubted any benefits accruing from motor car and kindred associations, but since realising that they have provided a formula for the basis of taxation, which is like adding insult to injury, I am convinced they would be better non-existent.

I note, however, they have managed to suggest a relief scale for the taxation of old cars. May we not reasonably expect this extended to cycles, and ought not the R.A.C. and other bodies to agitate for the extension?

My own case is the owning of an old tricar, for which I gave £16, and on this, by R.A.C. formula above referred to, I am to be taxed £3 3s. per annum. Can you wonder at my dissatisfaction?

W. P. WRACK.

Sir,—It is with grave apprehension that I view any possibility of increased taxation on motor cycles.

I am a school attendance officer in a rural district and am compelled to keep a motor cycle at my own expense in order to cover the large area which comprises the district allotted to me.

Any increase of taxation, therefore, will fall very hard on me, and, I am sure, on many others in a similar position.

CHAS. F. BAILEY.

Sir,—I am glad that this matter is now being taken up, and I sincerely hope that every motor cyclist will follow your instructions, and, as it were, stand shoulder to shoulder against the unfair tax which has been recommended to the Treasury.

In view of the valuable services rendered by motor cyclists during the recent manoeuvres, it has been proved beyond doubt that they could render useful service in actual warfare in case of invasion of this country. The Government's proposals at the present time, I consider, amount to nothing short of an intended tyrannical suppression of motor cyclists, more especially to those who, like myself, could not afford the proposed heavy tax and would perforce have to give up altogether.

STANLEY ADDISON.

Mr. and Mrs. Charles Northway, of Ambalangoda, with their Douglas and Bat motor cycles.

A LIGHT HOME-MADE RUNABOUT.

The runabout illustrated was home built by Mr. J. Mackley, a farmer of Redmill, Notts. It weighs 1½ cwt. The engine is 2½ h.p. and a two-speed gear and free engine are fitted, together with chain drive. The gear levers may be seen on the driver's right. Everything has been assembled in the village blacksmith's shop. Mr. Mackley says he can climb any hill around Redmill and can attain a speed of 20 m.p.h. on the level.

Sir,—We have much pleasure in enclosing you herewith four signatures to the petition against the iniquitous proposals *re* the new taxation of motor cyclists.

Much credit is due to you for the steps you are taking to protect motor cyclists' interests. You are apparently doing more than any of the organisations specially formed for their protection.

HOWARD AND CO.

Sir,—The other week I sent you ten signatures against the proposed increase of taxation on motor cycles. I also wrote to the M.P. for this constituency (Campbeltown), and have been promised his support any increase.

I am very pleased indeed that you are taking such a firm stand in this matter. I venture to think that had our large motor cycling organisations bestirred themselves earlier in the day, we would have heard nothing of this proposed absurd and unfair increase of tax.

Though I am not in the same position as your correspondent "J.T.J.," I am at one with him in his ideas. Personally I use a 7 h.p. Indian, weight just 2 cwt., for business purposes, my district being hilly.

Taxes of every kind are increasing every day, but if these were equitable, I think none of us (motor cyclists) would complain; it is when such as myself are called upon to pay without reason an increase of £2 3s. to our yearly revenue tax—the same tax as for a large car weighing 12 to 20 cwt. and carrying four, sometimes five, passengers—that our complaint is more than justified.

I trust you will not lay down the cudgels of war until we have gained a victory; a victory for which we ought not have been called upon to fight.

JAMES S. SMITH.

[The foregoing letters are typical of dozens we are receiving regularly on the same subject. —Ed.]

### The Date of the T.T. Race.

Sir,—On hearing, about the middle of July, that 1913 T.T. races would probably be held on 4th and 6th June, 1913, I wrote the A.C.U. and pointed out the difficulty North-country men would have in reaching the I.O.M. at that date, as the sailings from Heysham to I.O.M. do not begin until 21st June. I was informed "that the A.C.U. was entirely in the hands of the I.O.M. authorities." Then I wrote to the Chairman of the I.O.M. Highway Board, and he replied "that no application had been made to the Board for the closing of the roads on any dates next year and the dates arranged were

generally those selected by the Auto Cycle Union." That being the case, we should like to know if the races cannot be held after 21st June, as the earlier dates will prevent many North-country men making the trip to the Isle as usual, much to their disappointment. Fourteen motor cyclists in Skipton and district have expressed the same opinion, and no doubt many more in the North would agree. The journey by Liverpool would take up two more nights, which in many cases could not be spared.

R.L.

Sir,—I see in last week's *Motor Cycle* it is proposed to hold the T.T. in the middle of a week. This will be a great disappointment to many, as at that time of the year a week-end is the only holiday possible. I know many keen motor cyclists who were there this year, and look upon the few days over on the island as the jolliest-outing of the whole year, none of whom could attend in the middle of a week. I should like your readers' opinions on the matter, and, if necessary, to petition the A.C.U. before it is too late.

WEEK-ENDER.

### A Run on an 8 h.p. Cyclecar.

Sir,—I read with interest your article headed as above, and note that you refer to the "side lever which controls the free engine and the gears." In the Rollo cyclecar the free engine, or clutch mechanism is foot-operated, and only when changing the gear ratio is it necessary to take a hand off the steering wheel.

The control with one foot on the accelerator and the other on the clutch pedal and both hands free for steering, I find to be perfect, and anyone accustomed to the Zenith-Gradua gear with and without separate clutch handle will realise the advantage gained from being able to clutch and declutch independently of the gear-operating handle and without altering the gear ratio.

I do not write this in any spirit of criticism or antagonism to the Duocar, which I believe to be an excellent little vehicle of its kind.

CHAS. S. LAKE.

### To Settle a Wager.

Sir,—A few weeks ago, after an argument with a friend, a wager was made that I would not succeed in carrying six persons on a standard motor cycle for three miles; this I

An accident risked to settle a wager.

did, and afterwards I tried with seven, as the enclosed photograph depicts, and I succeeded in carrying this load (an aggregate weight of nearly half a ton) for a distance of two and a half miles without a fall on my 3½ h.p. Armstrong James, the last mile being to Stonebridge, where I delivered the load safely, demonstrating the fact that a modern motor cycle is capable of standing enormous strain.

ALBERT MILNER.

Will the motor cyclist living in Sweden who wrote to G. V. Lobb, Trenault, Egloskerry, Cornwall, write again, as his address has been lost?

# HILL-CLIMB AT RIVINGTON PIKE.

Liverpool A.C.C. Event attracts Record Entry.

General view of the competitors lined up for the start, which took place on a gradient of 1 in 12.

NOT content with a matter of 208 entries, the official programme of the Liverpool Auto Cycle Club stated that further entries would be accepted. Naturally, with so many contestants, the environments of Rivington Pike, Horwich, presented an animated scene. The hill is in private grounds, and permission to hold the contest at Rivington was granted by Sir Wm. H. Lever, and the Liverpool Corporation Waterworks. When we arrived at the hill—after an ever-to-be-remembered ride through Manchester—weighing operations were in progress, and afterwards the machines were lined up in systematic order for inspection by the judge, Mr. T. W. Loughborough, whose onerous duties were rendered more simple by the peculiar absence of restrictions governing the machines.

Some of the entrants considered the surface of the hill very rough, others were shy of the two gradual bends, the last of which was the most difficult to negotiate, but really we could see little to cavil at, seeing that straight hills with billiard table surfaces are non-existent. The course was about five-eighths of a mile. It was one o'clock when a start was made. Messrs F. Sellars and Percy Butler officiated at the start. The latter's duty was to hold the telephone receiver, and his "Get ready," "Go," were heard by the timekeeper at the summit, who started the watch. A standing start was made, helpers being allowed, and they were wanted too! for the gradient on the starting line was about 1 in 12, and the engines were not allowed to be started beforehand.

## The Single and Twin Lightweights Separated.

Single and twin-cylinder lightweights had separate classes allotted to them. F. G. Edmond led off the ball, his 2 h.p. Humber picking up splendidly. Dudley (Hobart) and Barnes (Zenith) followed in quick succession. Williams (A.J.S.) made a quick start on his low gear, but it was left to J. Cocker (2½ Singer) to accomplish the fastest climb. Barnes, who was only ½s. slower, easily scored on account of his heavy weight. The result was:

### CLASS I.—SINGLE-CYLINDER MACHINES UP TO 350 C.C. ON FORMULA.

	Time.
1. F. W. Barnes (2½ Zenith) ... ..	64s.
2. J. Cocker (2½ Singer) ... ..	63½s.
3. F. G. Edmond (2 Humber) ... ..	73½s.

The twin lightweights were very little faster, only F. S. Whitworth (Douglas) beating Cocker's time. Smytheman, on another Colmore-Douglas—a brand new machine out of stock, so we were told—was second fastest. The twin Humber was single-geared and appeared slow in picking up. Phillpott's was the fastest of the team.

### CLASS II.—TWIN-CYLINDER MACHINES UP TO 350 C.C. ON FORMULA.

1. F. S. Whitworth (2½ Colmore-Douglas) ...	61s.
2. H. Smytheman (2½ Colmore-Douglas) ...	63½s.
3. J. Haslam (Douglas) ... ..	64s.

The class for single-cylinder machines over 351 c.c. drew most entries. Of the outstanding performances, W. E. Cook on a touring model A.S.L. struck one as travelling splendidly. D. Bradbury (Norton) was also fine. H. C. Newman (Ivy-Precision) made a splendid start and finished well, and his remained the fastest ascent until P. Weatherilt came along. He accelerated in splendid style, thanks to his Gradua gear. The hill and conditions just suited such a device. Weatherilt was easily fastest in this class. His Zenith had a J.A.P. 90 × 77.5 mm. engine with overhead valves. L. Newey (Ariel) appeared very fast, likewise E. V. Stevens (Dot), R. G. Mundy (Rudge), Axford (Martin), and McMinnies (Triumph). The last-mentioned was using the experimental Triumph with overhead inlet valve. Tolfree (Bat-Jap) trailed his silencer for several hundred yards. P. Pumphrey (Arno) ran very close at the top end. Bottoms, an amateur on a T.T. Triumph, took 57s. only, and would have done better had not his cap dropped over his eyes, causing him to wobble badly. H. Gibson (Bradbury) appeared to be bumped about more than anyone by the surface; we ascribed it to the tyres being inflated too hard. The results on formula are given below, also the times of the leaders.

### CLASS III.—SINGLE-CYLINDER MACHINES OVER 351 C.C. ON FORMULA.

	Time.
1. P. Weatherilt (3½ Zenith) ... ..	53½s.
2. W. G. McMinnies (3½ Triumph) ... ..	55½s.
3. S. R. Axford (3½ Martin-Jap) ... ..	59s.

S. W. Phillpott (2½ h.p. Humber), the hon. secretary of the club, on the starting line. On the left the starters, Messrs. Sellars and Butler, are seen at the telephone.

## Hill-climb at Rivington Pike.—

## A Lucky Escape.

The twins over 501 c.c. made light work of the hill. The first up, F. Shakespeare (7 Rex-Jap), gave everybody a fright. Travelling at about 50 m.p.h. he ran wide at the top bend, and headed straight for a spectator on the left-hand footpath. The latter became nervous and jumped into the roadway, seeing Shakespeare's frantic wobbles, but the rider recovered and charged him, both falling heavily, though providentially there were no bones broken. The machine, strangely enough, continued its mad career, and the sight of it running across the road riderless was most uncanny. It finally charged the bank and buckled the front wheel. J. J. Cookson (Matchless) followed, and as the crowd had not quite cleared off the road he was signalled to stop, but did not heed the warning, and actually made second fastest time of the day. H. Reed (8 Dot-Jap) had a narrow escape at the top bend, riding in the gutter with the valve lifter raised for nearly fifty yards. Nevertheless he clocked 48s., which is surely a record for this hill. Reed was entered in other classes, but wisely requested his time to count throughout after that thrilling incident.

## CLASS V.—TWIN-CYLINDER MACHINES OVER 501 C.C. ON FORMULA.

	Time.
1. J. J. Cookson (8 Matchless-Jap) ...	48½s.
2. J. L. Timperley (5 Dot) ...	52½s.
3. H. Reed (8 Dot-Jap) ...	48s.

Best amateur performance: J. H. Fox (7 Matchless).

Best performance of local rider: E. F. Baxter (6 Rex).

## The T.T. Machines.

The Junior and Senior T.T. machines were again divided. In the former section Whitworth again scored a notable success, his little Douglas, with valve springs of the Colmore tension, simply roared up the incline. He was backed up by Smytheman and Haslam, Cocker tying with Haslam in order of speed, Weatherilt coming next.

In the Senior T.T. class Weatherilt improved his previous time by ½s., whilst Newman went 3s. better. Tolfree made a fine ascent in 58s., as also Mundy on a Rudge. Bottoms fell at the corner whilst travelling at over 40 m.p.h., but escaped luckily. Sheldon's Regal-Precision shone conspicuously, and Horsman's 3½ h.p. Singer was another fleet hill-climber.

## CLASS VII.—SENIOR T.T. MACHINES ON TIME.

	Time.
1. P. Weatherilt (3½ Zenith) ...	52½s.
2. H. C. Newman (3½ Ivy) ...	54s.
3. W. N. Sheldon (3½ Regal-Precision) ...	57s.
4. V. E. Horsman (3½ Singer) ...	57½s.
5. { R. G. Mundy (3½ Rudge) ...	58s.
{ P. E. Tolfree (3½ Bat-Jap) ...	

Class VIII., for any machine, on time, consisted of a mixture of the previous runners. Several were slower than formerly, including Cookson, Bradbury, Newman, McMinnies, and Mogridge, proving that a second or third attempt does not always mean a faster climb. No one even approached Reed's wonderful speed. Result:

## CLASS VIII.—ANY MACHINE, ON TIME.

	Time.
1. H. Reed (8 Dot-Jap) ...	48s.
2. P. Weatherilt (3½ Zenith-Gradua) ...	52s.
3. J. J. Cookson (7 Matchless) ...	53s.
4. J. F. Sirett (7 Indian) ...	54s.
5. H. C. Newman (3½ Ivy-Precision) ...	55½s.
6. N. H. Brown (7 Indian) ...	56½s.

## Fixed Gears in the Restarting Test.

The stopping and re-starting test was run in two classes, first on time and then on formula. Consequently some of the competitors' faces were becoming rather too familiar and the proceedings too long drawn out. In this class there was no stipulation as to variable gears, consequently the crowd of spectators were treated to the interesting sight of motor cyclists struggling to start big twins and high compression singles on a gradient. Some succeeded, notably Cookson, who, after an almost superhuman effort, got his 8 h.p. fixed-gear Matchless off the mark and picked up in wonderful fashion. He was easily fastest. One or two others tried to restart single-gear machines, but almost collapsed with exhaustion and gave up. Surely a restarting test was never intended for any but variably geared machines. Barnes and Weatherilt on their Zenith-Graduas stopped promptly and got away without leaving the saddles—really impressive performances which were, however, overshadowed by muscular men who knew how to handle their machines. Whitworth (Douglas) pushed off on the low gear, and in stepping on the footrest half of it broke away, letting him down and tearing a rent in his pants. Marston (8 h.p. two-speed Dot-Jap) restarted without dismounting, and he succeeded in making

V. E. Horsman (3½ h.p. Singer) 100 yards from the start.

H. V. Smytheman (2½ h.p. Douglas) nearing the timekeeper's tent.

H. C. Marston (3 h.p. two-speed Dot-Jap) stopping between the lines, in the stopping and restarting test. All the variable-g geared machines were actually beaten for speed by a rider of an 3 h.p. fixed geared mount.

the fastest ascent in the formula class. E. Longden drove a sidecar, a sporting terrier on board heralding his approach.

#### CLASS IX.—STOPPING AND RESTARTING TEST ON TIME.

	Time.
1. J. J. Cookson (7 Matchless) ...	62s.
2. F. W. Barnes (8 Zenith) ...	62½s.
3. P. Weatherill (3½ Zenith) ...	63½s.

#### CLASS X.—STOPPING AND RESTARTING TEST ON FORMULA.

	Time.
1. F. W. Barnes (2½ Zenith) ...	76½s.
2. G. Griffiths (3½ Zenith) ...	73½s.
3. J. Haslam (2½ Douglas) ...	77s.

Best amateur performance: H. D. Ashworth (3½ Triumph). Time, 76½s.

Best performance by local rider: A. J. Jenkins (2½ Douglas). Time, 86½s.

#### The Sidecar Classes.

Sidecars were again split up into singles and twins, but there was a sad lack of idea as to the definition of a touring sidecar. Most were baby carriages in the single-cylinder class, several were devoid of springs, and a mudguard was practically unknown. Moreover, one competitor actually carried a baby as passenger.

#### CLASS XI.—SINGLE-CYLINDER SIDECARS ON FORMULA.

	Time.
1. K. H. Clark (3½ Corah-Jap) ...	76½s.
2. H. Bottoms (3½ Triumph) ...	78½s.
3. H. C. Newman (3½ Ivy-Precision) ...	78s.

Best amateur performance: H. Taylor (3½ Bradbury). Time, 74½s.

Best local performance: F. Rees (3½ Rudge). Time, 117½s.

In the twin class matters were somewhat improved, but it was thought that the limit had been reached when a Douglas rider brought a box—more like a coffin than anything else—without springs or upholstery and with a cardboard cover.

#### CLASS XII.—TWIN-CYLINDER SIDECARS ON FORMULA.

	Time.
1. F. W. Barnes (8 Zenith) ...	58½s.
2. A. J. Stevens (5 A.J.S.) ...	71½s.
3. E. Longden (8 Dot-Jap) ...	88½s.

Best amateur performance: A. J. Brewin (8 Zenith). Time, 95½s.

Best local performance: A. J. Jenkins (8 Williamson). Time, 104s.

The contest was smartly run off, and but for the absence of rules governing equipment in the touring classes, can be regarded as a very successful event. The many officials worked with a will, Mr. Phillpott in particular; also Messrs. C. Hobbs and E. F. Baxter, who worked out the formula results.

The formula recommended by *The Motor Cycle*  $\frac{C \times T^2}{W}$

was used.

#### PROPOSED AMATEUR MOTOR CYCLISTS' ASSOCIATION.

A meeting was held at 89, Pall Mall, London, S.W., on Wednesday, the 16th inst., further to consider the formation of a Motor Cyclists' Association, restricted to ladies and gentlemen fulfilling the amateur definition as recently fully explained in *The Motor Cycle*.

Mr. H. P. Harding (in the chair) was supported by Mr. C. C. Cooke. Mr. A. G. Reynolds, one of the promoters of the scheme, was unavoidably absent, but there were also present several well-known motor cyclists.

The Chairman read several letters from interested motor cyclists promising support to the scheme, and he also announced that he had received promises of support from a number of amateur riders.

The meeting discussed at length the proposed definition of an amateur, and two or three slight alterations were made.

The promoters of the proposed body wish it to be clearly understood that it is in no way intended to compete with any other club or body, it being their sole intention to bring together a body of motor cyclists whose ideas are in agreement with the scheme, and who will support a national motor cyclists' movement on the lines of the definition for the furtherance of the sport.

It was eventually decided to hold another meeting at an early date, the date and place of which will be announced later, when all interested motor cyclists will be invited to attend.

# 67 Miles 782 Yards in 60 minutes on a 3½ h.p.

A CHAT WITH G. E. STANLEY, THE HOUR RECORD HOLDER.

PROBABLY the most important record of the long list and the one most coveted is the 500 c.c. single-cylinder hour record. The list of previous holders only gives some idea of its importance, seeing that many have tried but failed, and even the present holder did not annex the record at the first time of asking. G. E. Stanley has undoubtedly placed himself in the very front rank of track riders by this latest achievement of 67 miles 782 yards on a 3½ h.p. 85 × 88 mm. Singer, and last week we sought him in order to obtain a few experiences, though Stanley is very reticent. He experienced lubrication trouble and a puncture in the hour race for *The Motor Cycle Cup* on the 12th inst., and returning to Coventry he spent Monday making finishing touches, setting off for Brooklands on Tuesday. After a lap he waited until the late afternoon before making his attempt. Timed by Mr. A. V. Ebbelwhite, his first lap from a standing start was at 64 m.p.h., which he has improved upon, but the next lap averaged over 70 m.p.h., and Stanley managed to maintain this speed for lap after lap. He was using a 3¼ to 1 gear, so that his engine was "revving" at approximately 3,400 r.p.m. The record ride was practically devoid of incident; he experienced no trouble till the last lap of all. The Singer engine continued to pull magnificently without the slightest variation. Stanley had no fear as regards his petrol consumption, for he is no believer in huge jets. He uses a 1¾ gallon tank, and usually averages about sixty miles to the gallon, his B. and B. carburetter being unfaked in any way. Fifty miles were reeled off at an average speed of 69.439 m.p.h. The jolting at this speed will be best understood by Brooklands habitués. To those who do not know the effort required to keep in the saddle on a 3½ h.p. single at nearly 70 m.p.h., we would say that a twin at 80 n.p.h. is to be preferred. The back wheel of a

3½ h.p. machine is constantly bumped clear of the ground, and the effect upon the rider can be very easily imagined.

It was nearly dusk when Stanley finished, but the exhaust pipe was not glowing as some do, which speaks well for the condition of his engine. There was every likelihood of the record being placed in a safe position for a long time to come when Stanley com-

menced his last lap, but on this final stage, at the end of the railway straight, the inlet valve—which was not new—broke at the cotter hole. The engine continued to fire intermittently, the valve working automatically, but Stanley had to assist his machine along to the finishing line by paddling with his feet. This one and only *contretemps* reduced the record to 67 miles 782 yards, but in Stanley's opinion it may not remain there long. By next spring he considers that over 70 m.p.h. in the hour will be possible with a 500 c.c. single-cylinder.

Of course, luck must be with the rider as Stanley explained. He mentioned, also, how quite simple details, often ignored by the ordinary rider, such as the tension of the belt, made several seconds difference in the lap speed.

By the way, a dinner was arranged by the Singer Motor Co., Ltd., at the Queen's Hotel, Coventry, last evening to celebrate Stanley's success.

## Hour Record Holders.

A review of past records in the 500 c.c. class is interesting as showing the progress in engine design and machine construction during the last few years:

	mls.	yds.	
O. C. Godfrey (Rex) ...	59	1,350	Nov. 24, 1909
W. F. Newsome (Triumph) ...	59	1,478	Apr. 29, 1911
V. J. Surridge (Rudge) ...	60	783	May 25, 1911
J. R. Haswell (Triumph) ...	63	194	Aug. 26, 1911
W. Stanhope Spencer (Rudge) ...	65	803	Oct. 3, 1911
G. E. Stanley (Singer) ...	67	782	Oct. 15, 1912

Details of the kick-starter and hub plate clutch operated by a pedal and Bowden wire on the 1913 Zenith. See page 1213

## A HOOD FOR SIDECARS.

This latest example of sidecar hoods is of smart appearance, rigid and easily manipulated. The upright main stay allows a clear entrance to the sidecar seat. The Dulwich Hood and Screen Co. are the makers.

# OPPOSING THE NEW TAXES.

More Signatures Wanted. Further Petition Forms with this Issue.

**A**LTHOUGH we have received many thousands of signatures to the petition which we circulated on the 3rd inst., many more are required if motor cyclists do not want to be saddled with a burden in the shape of greatly increased taxes next year. As the Auto Cycle Union meeting to consider the question of taxation of motor cycles is not until the 30th inst., we have decided to reprint the petition form, and one of these forms will be found in every newsagents' copy of *The Motor Cycle* this week. Nothing whatever has been done so far by the Treasury to calm the minds of motor cyclists with regard to the iniquitous proposal of the Taxation Committee to tax motor cycles on the motor car basis, *i.e.*, on the bore only, but the Treasury has issued a draft of new regulations which are to come into force on January 1st next. These follow the recommendations of the Committee on the Horse-power Rating of Motor Cars, but not a word has been said about the injustice of the proposal to tax such a motor cycle as the one described in the current issue, and which has a cylindrical capacity of 750 c.c., £1, and the smooth-running four-cylinder F.N. by the same rule £3 3s. The total cubical capacity of the F.N. is 494 c.c. We have given other examples of the gross injustices of the recommendation week by week, and we want to show the Lords of the Treasury the opinions of motor cyclists generally on the subject.

A number of readers have addressed a copy of the letter we attached to the petition form to their respective Parliamentary representatives, and in many instances replies have been received from the members in question, stating that they have noted the arguments and will endeavour to prevent motor cyclists being unduly

taxed. We trust they will keep their promises, and that the Treasury will carefully consider our petition when it is presented.

Club secretaries, employers of men engaged directly or indirectly in the motor cycle trade, should do their best to obtain further signatures. Thousands of workmen will suffer if the proposed new taxes become law, for it will mean a direct blow to the motor cycle industry. All who may be affected should make a point of signing the petition. Those readers who are considering the purchase of a motor cycle and cannot afford a £3 3s. tax should also sign the forms. United action must be taken without delay if the petition is to succeed.

The latest Gillyard cyclecar on which W. Gillyard won the P. and M. Cup and Gold Medal at the Bradford M.C.C. Hill Climb. This model has wood side members with springs in one piece from both axles, 8 h.p. engine, three-speed gear box, chain drive to one rear wheel, the other wheel being loose on the axle. The weight of the chassis is 4½ cwt., and the complete vehicle 6 cwt. The makers tell us that the machine is not so fast as a motor bicycle and sidecar; the four wheeler, however, has an advantage in the increased comfort of the springing.

## 1913 ARIELS.

A 6 h.p. Twin. Kick-starter on the 3½ h.p.'s.

Three types of Ariel motor cycles will be marketed in 1913. The 3½ h.p. roadster type will be obtainable in three models, the T.T. racer in two models, and an addition to the ranks is a 6 h.p. twin cylinder with two-speed gear, free engine and chain drive, which should appeal to sidecarists. The bicycles will be supplied with free engines and three-speed gears. In addition to the well-tried Ariel decompressor, the

three-speeders will have a new kick-starter, enabling the engine to be started with the wheels on the ground. The frame has been redesigned and the wheelbase lengthened. A new front fork is also fitted, as well as oil-retaining and wet-proof hubs. The magneto is now controlled by a handle-bar lever. The front foot-rests are adjustable, and will be made in two lengths.

T.T. model Ariel for next year.

1913 model 3½ h.p. Ariel with kick-starter, three-speed gear and sprung saddle-pillar. The wheelbase has been lengthened.

The winning team to the A.C.U. East Midlands contest last Saturday, described on page 1213. The riders are G. W. Spencer, J. D. Mitchell, and J. Farnworth all on Rovers.

## ENTRIES FOR THE AUTUMN ONE DAY TRIAL.

Below we give the entries for the A.C.U. Autumn Trial, which starts from Kendal on Saturday next, the 26th inst.:

### MOTOR BICYCLE CLASS.

Rider and machine.	Rider and machine
G. T. Newsome (3½ Rover)	S. T. Tesser (5 Bat)
D. H. Noble (3½ Rover)	V. Busby (3½ Alldays)
V. E. Horsman (3½ Singer)	A. J. Moffat (3½ Zenith)
A. H. Alexander (7 Indian)	L. Newry (3½ Ariel)
J. R. Alexander (7 Indian)	F. C. North (3½ Ariel)
H. J. Beal (3 N.S.U.)	F. H. Thornton (4 Swan)
J. D. Nixon (3½ Rudge)	H. Ball (3½ Triumph)
G. B. Bennison (3½ V.D.)	J. H. Kerr (6 N.S.U.)
G. N. Norris (3 New Imperial)	Mrs. M. Hardee (3½ P. and M.)
J. Andrew (4½ New Imperial)	G. D. Hardee (3½ Triumph)
T. C. Delahey (2½ Sunbeam)	T. J. Ross (3½ Triumph)
J. E. Gieswood (2½ Sunbeam)	V. D. Walker (3½ Rudge)
A. H. Ratcliff (3½ B.S.A.)	C. Lester (3½ P. and M.)
P. N. Gilbanks (3½ Douglas)	W. Pratt (3½ P. and M.)
O. W. Braithwaite (3½ Rudge)	V. Shaw (3½ P. and M.)
E. Walker (4½ Monarch)	J. Oliphant (3½ Premier)
V. Underhill (3½ Monarch)	S. A. Rowlandson (3½ Rudge)
E. A. Wilson (3½ New Hudson)	G. T. Gray (3½ Rudge)
H. C. Wilkins (3½ P. and M.)	H. Harrison (3½ Rudge)
E. C. Clow (6 Zenith)	S. Crawley (3½ Triumph)
H. Reed (8 Dor)	R. R. Rothwell (2½ Douglas)
R. Rhodes (3½ Wulfruno)	J. Pass (6 Clyde)
L. Pennington (2½ A.J.S.)	

### PASSENGER CLASS.

G. G. Mundy (8 G.W.K.)	J. Chater-Lea, jun. (8 Chater-Lea and sc.)
H. F. S. Morgan (8 Morgan runabout)	F. Smith (5-6 Clyno and sc.)
Sam Wright (8 Humberette)	C. M. Keiller (8 G.W.K.)
A. G. Eames (5-6 A.C. Sociable)	J. T. Wood (8 G.W.K.)
H. C. Mandy (5-6 A.C. Sociable)	F. J. Fisher (8 Chater-Lea and sc.)
H. G. Dixon (3½ New Hudson and sc.)	W. D. South (5 Rudge and sc.)

## RUDGE CYCLECAR EXPERIMENTS.

In his speech to the shareholders of Rudge-Whitworth, Ltd., on Monday last, the chairman and managing director, Mr. C. Vernon Pugh, referring to the Rudge cyclecar, said they were engaged on experiments on what might prove, and he hoped would prove, to be an exceedingly important departure—a Rudge cyclecar. In this they were strictly confining themselves to motor cycle methods and making it a real cyclecar, and not in any sense a motor car. They had every reason to believe that they would be able to exhibit a standardised model at the Olympia Show in November, and it was his own belief, from what he had seen of the experiments so far, that they would have an exceedingly good cyclecar to offer in the name of Rudge-Whitworth, and one that would do the firm the very greatest credit.

## THE LATEST P.V. SPRING FRAME.

The illustration shows the latest model 3½ h.p. twin-cylinder P.V. It will be noticed that the mud-guard is provided with an ample extension, and that the new 3½ h.p. twin-cylinder J.A.P. engine, 60 ×

3½ h.p. spring frame P.V.

76 mm., is fitted. As our readers are aware, the chief speciality of this machine is the ingenious form of springing which has been referred to on previous occasions in our pages. Messrs. Seale and de Becker, 162, Great Portland Square, specialise in twin-cylinder machines, the other models being the 4-5 h.p. 70 × 71 mm. and the 5-6 h.p. 76 × 85 mm.

## THE DOUGLAS CYCLECAR.

Last week we referred to the fact that Messrs. Douglas Bros. were experimenting with cyclecars. We are now able to illustrate the first model, which, of course, is propelled by a twin-cylinder horizontal engine.

## CURRENT CHAT.

## TIME TO LIGHT LAMPS.

Oct. 24th	...	5.48 p.m.
" 26th	...	5.44 "
" 28th	...	5.40 "
" 30th	...	5.36 "

## Four up Sunrising on a Cyclecar.

A Humberette carried four passengers up Sunrising Hill last Saturday. Sam Wright was at the wheel.

## The New Four-cylinder F.N.

The information we published concerning the 1913 model four-cylinder F.N. was too premature, and there is a slight inaccuracy in the preliminary announcement. Complete details will be published shortly.

## A New Appointment.

Mr. H. Belcher has resigned his position as sales manager to Messrs. Humber, Ltd., to join the firm of A. R. Atkey, Ltd., Nottingham. This firm does an enormous business in South Africa, importing motor cycles and accessories. We wish Mr. Belcher every success.

## Cyclecar Examiner.

The Show Management Committee of the Motor Cycle Manufacturers' Union have appointed Professor Sharp Wh.Sc., A.M.I.C.E., M.I.A.E., etc., examiner of cyclecars to be exhibited at the forthcoming Olympia Motor Cycle Show, to ascertain that such cyclecars conform to the definition as per regulations.

## Touring France and Switzerland on a Lightweight.

Greame Fenton, who competed successfully in the Gaillon hill-climb, is now making a tour with the same Clément-Enfield machine through Switzerland and France. Among the places he will touch are Besançon, Geneva, Grenoble, Marseilles, Lyons, Dijon, etc., returning to Paris next month. Incidentally, Mr. Fenton tells us that he climbed Gaillon Hill with sidecar and passenger, the total weight being 4 cwt. 2 qrs. 24 lbs., which is distinctly good for a 2½ h.p. twin lightweight.

## Racing at Brooklands.

The extra monthly meeting, which will be held on November 9th, will include the following races:

1. The Fourth 1912 Time Trials.
2. The Cyclecar Olympic Hour Race.
3. The Sidecar Olympic Hour Race. (2 and 3 will be run together.)
4. Three Lap 500 c.c. Race.
5. The Junior Olympic Hour Race. (For machines under 350 c.c.)
6. Three Lap 1,000 c.c. Race.
7. The Senior Olympic Hour Race. (For machines under 500 c.c.)

The entries close on Saturday, November 2nd.

## The Hour Record.

F. H. Arnott is now the head of the Rudge-Whitworth racing stable, and we hear that a squad of Rudge testers is now at Brooklands preparing to recapture the single-cylinder hour record.

## Awards Confirmed.

Hugh Gibson (3½ Bradbury and sc.) has now been officially declared winner of the P. J. Evans rose bowl, offered in the passenger class of the Birmingham M.C.C. twenty-four hours' trial. R. G. Mundy (Rudge) won the cup in the solo class.

## Hill Climbing.

F. J. Watson writes that he successfully climbed Arms Hill, Henley-on-Thames, at the beginning of the week on his 3½ h.p. Swift with sidecar and passenger. The machine was in full touring trim, and the total weight of machine and passengers was 568 lbs. The gear used was a Sturmey-Archer, the lowest ratio being 13 to 1.

## More Taxation Crudities.

It is worthy of notice that the new Rudge sidecar machine, which has an engine of 750 c.c., owing to its long stroke, will come within the £1 limit, though with sidecar it may turn the scale at 4½ cwt. The Martin-Jap racer, however, a machine which weighs 150 lbs. and has a capacity of 493 c.c., will necessitate a payment of three guineas. Thus we see the absolute unfairness of the proposals without having to make comparisons between motor cycles and cars or carts. We should very much like to know what qualifications the committee which made these proposals had to legislate for motor cyclists. A simple explanation of the recommendations is in itself a condemnation.

We urge every reader to sign the petition form in this issue.

## SPECIAL FEATURES:

LATEST LOW FORCED INDUCTION ENGINE.

1913 MODEL S (Illustrated.)

HILL-CLIMB AT RIVINGTON PIKE.

## Definition of a Cyclecar Chassis.

The Show Committee of the Motor Cycle Manufacturers' Union have decided that a chassis shall comprise complete transmission, tyres, bonnet, radiator (if any) and tank. Mudguards and footboards (if any) need not be included when the chassis is being weighed. The maximum chassis weight must not exceed 6 cwt.

## Stolen Motor Cycles.

A 1911 Triumph, of which the following is a description, was hired from King and Harper, Bridge Street, Cambridge, on the 16th inst. and has not been returned. The hirer gave the name of Cecil Thompson, Christ's College, which name and address prove to be false. The registration number is CE 1633, engine number 16305, and frame 169827.

A T.T. B.S.A., BO 756, has been stolen from a Cardiff member of the A.A.

A 1912 Motosacoche, engine No. MV 23581, frame No. A 4735, was recently stolen from the Penzance Garage, Ltd., 69a, Market Jew Street, Penzance.

A T.T. Triumph roadster was stolen on the 19th inst. from outside a shop in Northampton. The engine number is 13704 and the registration NH 631. There was not enough petrol in the tank to travel a mile, and when the machine was taken it was too late to purchase any, being after 11 p.m. Possibly some Northampton motor cyclist supplied the necessary fuel, in which case he may be able to give the owner, Mr. J. Lees, 44, Bridge Street, Northampton, some information.

### The Amateur Question.

The Auto Cycle Union conference on the amateur question will be held on Friday, October 25th, at the headquarters of the Mersey Motor Club, St. George's Restaurant, Redcross Street, Liverpool.

### Olympia Motor Cycle Show.

*Bona fide* members of clubs may obtain an admission ticket to the Olympia Motor Cycle Show at half-price if applied for through their secretaries in quantities of not less than six.

£69,949 17s. 3d. Profit.

The above sum represents the profits of the Triumph Cycle Co., Ltd., during the year ended August 31st last. 20% dividend and a bonus of 2s. per share is being paid on the ordinary shares, and 6½% on the preference shares. A magnificent result!

Kick starter fitted to 1913 Humber 31 h.p. three-speed models (see page 1199.)

### The Stanley-Bailey Match.

Matters have not progressed in the matter of arrangements for the Stanley-Bailey match. Bailey is said to be the stumbling-block. It appears that he has been told that Stanley has a four valve 350 c.c. engine ready for the match, and he objects to this new type of engine. Stanley, however, assures us that he has no such engine, although he admits having prepared a new 350 c.c. engine with overhead valves, which is according to the agreement.

### An Air-cooled Exhaust Valve.

An exhaust valve of novel construction was shown to us a few days ago by Mr. de Lissa. This valve, which was fitted to a Motosacoche engine 64 x 90 mm., had the following advantages: (1.) It was air-cooled, having quite a large surface exposed to the air instead of being situated in the midst of the hot gases, with the result that it did not become pitted and require grinding. (2.) Owing to its construction it did not require to be forced open by the cam against the pressure in the engine, but only against its spring, thus allowing the engine to turn over extremely fast. Mr. de Lissa informed us that a speed of 5,450 revs. per minute had been attained, which gives an average piston speed of 3,225 feet per minute. We saw the engine running on the stand at a very high rate; so fast, indeed, that it sounded like the buzz of a twin-cylinder. The valve has two faces, and one might suppose that it would be a difficult matter to keep it gas-tight in consequence, but this is not the case, as it automatically fits itself to its seating, and we never met with better compression on any engine, large or small. This valve can be easily fitted to any engine which has a cap over the exhaust valve.

## FUTURE EVENTS

Oct.	25.—A.C.U. Conference on the "Amateur" Question at Liverpool.
"	26.—A.C.U. Autumn Open One Day Trial.
Nov.	8-16.—MOTOR CAR SHOW AT OLYMPIA.
"	25-30.—MOTOR CYCLE SHOW AT OLYMPIA.
Dec.	.. —Auto Cycle Union Open Silencer Trial.
"	27-28.—Motor Cycling Club Annual Winter Run.

### The Dutch-English Trial.

The above successful competition, which will be held next year in England, probably on August Bank Holiday, will be organised by the Auto Cycle Union. The actual organisation has been referred to the Competitions Sub-committee. Dutch motor cyclists are very keen and excellent sportsmen.

### The Low Engine.

The forced induction engine invented by Dr. Low, and described and illustrated in this issue, is said to give 10-15 h.p., although only 70 x 130 mm. The design is not at all displeasing to the eye; in fact, with one or two exceptions the casual observer would take it for an ordinary water-cooled petrol engine.

### What is a Cyclecar?

An attempt has been made to keep the Singer cyclecar out of the Olympia Motor Cycle Show because it is designed on car lines, but the photograph reproduced in our last issue showing its small dimensions has, we believe, put an end to the movement.

### Next Saturday in the Lake District.

Mr. T. W. Loughborough, the A.C.U. secretary, rode round the One Day Trial course last Monday astride a two-speed Douglas. He also made the necessary hotel arrangements, including the usual cup of tea provided by *The Motor Cycle*. Kendal is the starting and finishing point, and one may expect Red Bank, Grasmere, and Kirkstone Pass to be included in the course. There are other noted acclivities in the neighbourhood, Tow Top for instance, the Lake District providing a really excellent testing ground just before the shows.

### Lighting Byelaws.

A few weeks ago we were advised by a reader that he had been summoned under a byelaw existing in one of the Welsh counties for not carrying two lights showing the full width of a sidecar combination. We have endeavoured to obtain particulars of these byelaws both from the Local Government Board and the Home Office, but without success. The last communication we have received is from the Under Secretary of State, who advises us that he was directed by the Secretary of State to say that he has no knowledge of any byelaw such as we mention. If no such byelaw exists anywhere in the United Kingdom, how is it that the motor cyclist in question was summoned under it, convicted, and fined? Perhaps readers who live in the county or counties in which these byelaws exist will acquaint us with the wording and the date upon which they were sanctioned, as we wish to publish information respecting them for the benefit of those readers who may happen to be passing through the counties in question with their motor cycles and sidecars, and who apparently cannot become acquainted with the facts of any such byelaws being in existence except from those who are locally acquainted with them.

RIVINGTON PIKE, HORWICH.

Three parts of the way up the ascent, which was the scene of the Liverpool A.C.C. open hill-climb last Saturday.

# ZENITH IMPROVEMENTS FOR 1913.

Free engine and kick starter. New cut-out and sidecar fixing.

**Z**ENITH motor bicycles have been so successful and so universally victorious in competitions during the past season that the general design in the standard machines has undergone little alteration. A special sidecar clip bracket is now fitted. Lugs are brazed to the top tube and down tube, which are connected by a short vertical tube, thus making a solid fixing between the two frame tubes. This is the fitting suitable for Mills and Fulford sidecars,

Extra strong sidecar lug embracing the top and down tubes on the latest Zenith.

but slightly different modifications of these are designed for different makes of passenger attachments. A further small but important improvement is the introduction of a new magneto shield, which is fastened to special lugs on the footrest bracket. Curved over the magneto, further secured beneath the latter, and thus brought well under the crank case, this shield is of ample width, and further performs the important function of protecting the belt. Messrs. Zenith Motors, Ltd., have found that the belt suffers mostly

from mud thrown up by the back wheel. The tank is now made of heavier gauge material, and is secured by clips on its underside, thus leaving the top free, greatly enhancing the appearance and rendering the top of the tank easy to clean. The petrol gauge has been done away with, and in its stead a glass top filler cap is fitted.

As regards the rider's comfort, a pan top Middlemore saddle is now supplied. On the twin model two separate exhaust pipes are fitted with numerous small holes drilled at the end, and, despite the possibility of the proposed new Local Government Board regulation coming into force, a cut-out is supplied, Messrs. Zenith Motors, Ltd., assuming that the length of pipe affords the necessary room for the expansion of the gases. The exhaust cut-out, which is clearly shown in the accompanying illustration, is a particularly neat job.

## New Control Arrangements.

A slight alteration in the control is the adoption of a double Bowden control lever fitted to the near side of the handle-bar.

Cut-out fitted to the 1913 Zenith twin-cylinder model.

Kick starter and hub clutch operated by a pedal on the new Zenith.

will be fitted to order only. In the back hub there is an Albion plate clutch controlled by a quick pitch thread, and worked by a pedal and Bowden wire from the offside footrest. This pedal is fitted with a toe release, so that the clutch may be held permanently out of engagement or instantly engaged. The brake is in this case worked from the near side footrest. The kick-starter pedal is attached to a spindle running through an eccentric bearing on a carrier slotted at the end to take the rear wheel spindle and sliding in a bearing at its forward end, so that the whole control mechanism can slide with the wheel. As regards the kick-starting device, the free wheel, which is connected by chain to a sprocket on the rear wheel spindle, is attached to the kick starter spindle so that it may be easily dismounted if required. The eccentric bush is, of course, for facilitating the adjustment of the chain. The whole design is well carried out and reflects great credit on the company's works manager, Mr. F. W. Barnes, who has had it under test on his own machine for some time.

## AUTO CYCLE UNION NOTES.

**THE TAXATION COMMITTEE.**—The Hon. Arthur Stanley, M.P., has kindly consented to act as chairman, Mr. Otto Thomas taking the post of vice-chairman. The A.A. and M.U. will be represented by Messrs. Charles Jarrott, R. H. Head, and the Rev. Hassard Short; The Motor Cycle Manufacturers' Union by Messrs. J. V. Pugh, W. H. Wells, and T. H. Tessier; the Scottish A.C.U. by Messrs. Norman Macmillan, John Gow, and James Fulton (secretary). The Motor Cycle Union of Ireland representatives have not yet been nominated.

**A NEW MEMBER OF COMMITTEE.**—Rear Admiral Sir R. K. Arbuthnot, M.V.O., R.N., has been nominated by the Royal

Automobile Club to serve on the A.C.U. Committee. His election to this post was heartily acclaimed at the first meeting he attended.

**MEMBERSHIP.**—The increase of membership of the A.C.U. during the last month is 232, which number is made up as follows: 119 touring members, 21 full members, 60 through the affiliation of newly formed clubs, and 32 by the increase of membership of clubs already affiliated. The total membership of the Union now amounts to 10,000.

**AFFILIATION.**—The Hertfordshire Motor Cycling Club, Ltd., has become affiliated to the governing body; the membership was given as 60.

**THE LOCAL GOVERNMENT BOARD SILENCER REGULATION.**—The draft of the above regulation was referred to the A.C.U. Silencer Sub-committee for consideration.

**THE ONE DAY TRIAL.**—Mr. A. H. Priestley has been appointed chief travelling marshal on the occasion of the One Day Trial in the Lake District.

**MILITARY MOTOR CYCLISTS.**—A letter has been received from the Army Council thanking the Auto Cycle Union for the services of those members who had placed themselves and their machines at the disposal of the War Office during the recent manoeuvres and those responsible for the arrangements.

## NEW SINGLE-CYLINDER RECORDS.

G. E. Stanley Captures the Coveted Hour Record.

**A**S reported in our last issue, G. E. Stanley was busy at Brooklands last week. In his attack on the hour record on Tuesday he was successful in covering 67 miles 792 yards, and at the rate at which he was travelling would probably have done 69 miles 800 yards, but in the last lap the inlet valve spring broke. Fifty miles were covered in 43m. 12s., or an average speed of 69.459 miles an hour, beating his own record made October 3rd by 27s. His fastest lap was the second, which was covered at the remarkable speed of 70.48 m.p.h. The slowest was the seventeenth, when he was unfortunately partly obstructed by a cyclecar which was being driven on the track; the speed in this lap was 68.70 m.p.h. The average speed for

five laps was over 70 m.p.h. Stanley's performance beats Stanhope Spencer's Class C 500 c.c. record, in which the latter covered 65 miles 803 yards on a  $3\frac{1}{2}$  h.p. Rudge at a speed of 65.45 m.p.h.

On Wednesday Stanley made an attack on the mile and kilometre, but his best speed was  $\frac{1}{5}$ s. under record, owing to a nasty cross wind.

Harry Martin, however, on an  $85\frac{1}{2} \times 60$  mm. Martin-Jap, captured the five-mile standing start Class B record, covering that distance in 5m. 14s., beating his own record at Canning Town, time 5m. 26s. On a smaller machine,  $76 \times 60$  mm., he established the five-mile standing start record, time 5m. 42s.

## The Springing of Motor Cycles.

**C**OMMENTING on the letter published in a recent issue and signed "Springus," Messrs. Randall and Co., of High Street, Wanstead, have sent us an illustration and particulars of a newly designed spring frame motor bicycle, the design of which has been registered. The chain stays pass right round the back of the wheel in the form of an arch and are brazed to the seat stays at the centre. The wheel is carried on a pair of elliptical springs like carriage springs, and is free to rise and fall within certain limits. This method of springing the rear wheel of a motor bicycle is not absolutely new, but the illustration is of interest as there is little doubt that eventually all motor bicycles will be sprung fore and aft. The proper place to insulate the machine and rider from vibration is at the road wheel. It is strange that few large firms have seriously tackled the question of springing the rear wheel as well as the front. It has been pointed out to us from time to time by manufacturers that springing the rear wheel causes the rider to feel more of the engine vibration. This may be true to some extent. The machine illustrated has been ridden a good deal by the Captain of the Essex M.C., who reports that it is most comfortable and the springing is

a most practical device. The engine is a 3 h.p. twin-cylinder J.A.P. Saxon forks are fitted to the front wheel. Special attention has been paid to the mudguarding of the Randall machine, the guards on the machine illustrated are no less than 5in. across the chord.

A J.A.P. engine motor bicycle, sprung front and rear, made by Randall and Co.

## Inter-club Trial in the Midlands.

**O**N Saturday, the 19th inst., the East Midland Centre A.C.U. held an inter-club team trial. Each club comprising the centre was eligible to enter four teams of three riders, teams consisting of cycles, sidecars, or cyclecars. The Nottingham, Derby, and Lincoln clubs entered the full complement of competitors, Chesterfield contributing two teams. Leicester and Mansfield were not represented. A start was made promptly at 3 p.m., the men being despatched at minute intervals.

The first checking station was at Clarke's Garage, Derby, where heavy rain commenced to fall. However, before reaching Leicester, the next check, the rain had been left behind, and dry roads were again experienced. At the Quorn Garage competitors were checked in, and here Mr. Spence, the proprietor, had very kindly provided tea for all the riders.

Most competitors lighted their lamps before setting off for the next stage to Grantham, and ten miles from that place the secret check, controlled by Messrs. King and Dance, was in operation. Practically all riders lost time here and at the check in Grantham.

The finish was at Mitchell's Garage, to reach which competitors had to ride through Nottingham Market Place, which at about 9 p.m. on Saturday may be considered a bold achievement.

Five complete teams finished—three Nottingham, one Derby, and one Lincoln. The check sheets were worked out during the progress of a smoking concert at the Welbeck Hotel. Results:

The Nottingham Club win the Centre Challenge Trophy, with silver cups to the members of the winning team. The second team (also Nottingham) receive gold medals. Teams: 1, J. Farnsworth ( $3\frac{1}{2}$  Rover), J. D. Mitchell ( $3\frac{1}{2}$  Rover), and G. W. Spencer ( $3\frac{1}{2}$  Rover); 2, H. Dawson ( $3\frac{1}{2}$  Bradbury), J. R. Sylvester ( $3\frac{1}{2}$  New Hudson), and J. Richards ( $3\frac{1}{2}$  Sun).

The organisation throughout was very good. Assistance rendered by the police in passing through the towns *en route* was greatly appreciated.

### MOTOR CYCLE SHOW NUMBERS.

Thursday, Nov. 14th .. Passenger Machines.

" " 21st .. Show Forecast & Buyers' Guide.

" " 28th .. Complete Report.

A section of the members of the Denton M.C. (Lanes.) who competed in a reliability trial on the 6th inst. The membership of this club is now 58.

### North Middlesex M.C.C.

All competitions have been cancelled for the remainder of this year.

### Chichester and District M.C.C.

A club has recently been formed with the above title. The hon. secretary is Mr. J. Holloway, Avoca, St. Paul's Road, Chichester.

### Bishop Auckland, Darlington and District M.C.C.

The result of the hundred mile reliability trial has just been confirmed, and is as follows: 1, W. Swan (5-6 Zenith sc.); 2, N. Hill (3½ Zenith). These two riders alone completed the severe course out of twelve starters.

### Grosvenor M.C.

The second annual dinner was held on October 16th at the headquarters of the club, the Unicorn Hotel, Altrincham, Cheshire. The Chairman presented to Mr. E. G. Crisp the gold medal won by him in the reliability trial.

### Sheffield and Hallamshire M.C.C.

The reliability competition for the Bisby Cup was run off on the 12th inst. A circular course of about fifteen miles had to be covered no less than six times, and the secret checks—which, by the way, numbered about thirty-six or forty—were changed on each circuit of the course, so no competitor was prepared for the next point, thus doing away with the practice of making up for lost points on the first round. Results: 1, S. Sawyer (3½ h.p. Premier), lost 42 marks; 2, Roper (7 h.p. Indian), lost 97 marks; 3, D. Bradbury (3½ h.p. Norton), lost 100 marks. Twenty competitors finished the ride.

### Doncaster and District M.C.C.

A special competition in which the riders were expected to adhere as closely as possible to set speeds was held at Pigburn Hill on the 17th inst. The winner, B. Crouch (2½ h.p. Rumber) holds the Littlewood Perpetual Trophy for one year. C. Barnsdale (3½ h.p. Rex) wins the Rudge cattle-gear for the best single-cylinder performance. There will be a slow half-mile competition this (Thursday) afternoon.

### Oxford M.C.C.

There was a musical social in the club room at the Hotel Buol on the 12th inst., Mr. W. R. Morris being in the chair.

### Harrogate and District M.C.C.

On the 13th inst. a paper chase was held. The hares, T. C. Atkinson (3½ Triumph) and H. W. Fortune (3½ Brown), made for the Hambleton Hills, tackling a bad hill in the vicinity of Wass Bank. The hares were not caught, but W. Fawcett (2½ A.J.S.) arrived five minutes later.

### Hunslet M.C.C.

A reliability competition was held from Hunslet to Stamford and back, distance two hundred miles. Controls were at Tuxford, Stamford, and Bawtry; there were also four secret checks. Result: 1, W. Wood (3½ Premier); 2, F. Simpson (6 Bloomfield); 3, E. Thawley (6 Rex); 4, J. A. Eyre (6 J.A.P.).

### Newport (Mon.) M.C.C.

The reliability trial for the New Hudson Cup resulted in a tie between J. W. Foreman (Rover) and O. Harris. The tie was decided by a single round of the course, and the former won. H. Webb (Premier) made the best single-gear performance, and Pugh (6 Enfield) was first in the sidecar class.

### Oldham and District M.C.

The season was brought to a close with a very successful hill-climb on the Yorkshire Moors. The weather was favourable and the contest was a great success. The Motor Cycle formula was used. Results:

SIDECAR CLASS.—1, F. Wood (Triumph); 2, F. Whitehouse (Triumph); 3, H. Bottoms (Triumph).

SOLO CLASS.—1, J. Smith (Triumph); 2, H. Bottoms (Triumph); 3, F. Wood (Triumph).

P. Platt made fastest time in both classes.

NOVICES' CLASS.—1, G. Wood (Bradbury); 2, C. Wild (Bradbury); 3, T. Wigglesworth (Enfield).

T. Kenworthy (Dot) made fastest time.

All members are particularly requested to attend the A.G.M. on Tuesday, October 29th.

Members of the Doncaster A.C. (motor cycle section) at the hill-climb at Pigburn. The handicapping was done by each competitor estimating the speed at which he would ascend the hill.

# HOUR RECORD BROKEN

at Brooklands, on October 15th, 1912, by Mr. G. E. Stanley  
on a  $3\frac{1}{2}$  h.p. single-cylindere "SINGER" fitted with

# DUNLOP TYRES

**DISTANCE COVERED: 67 MILES 782 YARDS.**

The above is practically two miles better than the  
previous record, and also beats the twin-cylinder class record.

Brooklands, October 12th, 1912.

**JUNIOR ONE HOUR A.G.U. RACE:** Mr. G. E. Stanley ( $2\frac{1}{2}$  h.p. Dunlop-tyred "SINGER") **FIRST.**

**SENIOR ONE HOUR A.G.U. RACE:** Mr. J. L. E. Emerson ( $3\frac{1}{2}$  h.p. "NORTON") **FIRST.**

**The DUNLOP RUBBER Co., Ltd., Aston Cross, BIRMINGHAM; Alma St., COVENTRY.**

Branches—London, Nottingham, Manchester, Newcastle, Bristol, Leeds, Liverpool, Glasgow, Dublin, Belfast.

Why not fix on a 1913 N.S.U. now?  
—that would ensure good delivery.

## MODELS for 1913

2 h.p. single-cyl., 58×72 mm. 3 h.p. single-cyl., 73×78 mm.  
3 h.p. " 85×88 mm. 3 h.p. twin " 58×75 mm.  
6 h.p. twin-cylinder, 75×94 mm.

All fitted with carburettor with dual control, magneto ignition (high tension),  
loop frame sprung at rear, and spring forks. Can be fitted with the  
famous N.S.U. Two-speed Gear and Free Engine at small extra cost.

The N.S.U. Company are unrepresented  
in a few districts, and are open to appoint  
Agents. Early applications should be made.

**THE N.S.U. MOTOR CO., LTD.**

# Watch the

¶ Are you "watching"?

Have you noticed the consistency of its success?

Do you realise that such consistency means perfect service?

Note the records set out here and say—

Is it not worth while to know more of this all-conquering machine?

And then, if you would do so, write us—

**SINGER & CO. LTD.,  
Coventry & London.**

## 5,000 Miles on a 3½ h.p. Brown.

SINCE last Easter the writer (a Northern representative of this journal) has owned a 3½ h.p. Brown, and during the intervening period has given it a severe testing both with and without a sidecar attachment.

The machine, as delivered, was single geared, but a Bowden two-speed gear was quite easily and satisfactorily fitted under the bottom bracket without recourse to the makers or any dealer. Approximately 5,000 miles have now been completed with reliability and practically without any real trouble. Such troubles as have been encountered have only been minor ones, *e.g.*, a broken throttle wire, belt, two valves one at the head and the other at the cotter pin hole, both after running over 4,500 miles; also punctures, of course! The original Dunlop tyre is still on the front wheel; the back one, after doing about 3,500 miles, had to be discarded because it had begun to go at the bead.

### A Selection of Hills.

When ridden solo the machine has climbed Kirkstone Pass (from Ambleside), Kidstones Pass, Greenhow Hill, Buttertubs Pass, Wass Bank, Kilburn Bank, Sutton Bank, Limber Bank, and other hills. With sidecar and passenger clean ascents have been made of such hills as Garrowby, Brownstay Ridge, and Guy's Cliff. Generally the machine is powerful, fast, and comfortable, although perhaps a little on the noisy side.

There is one objection to this model, namely, the disadvantage of having to remove the engine from the frame when it is necessary to take off the cylinder for cleaning purposes. I understand, however, that

on the new model this difficulty is non-existent, and also that certain other improvements have been incorporated.

The Bowden gear has behaved splendidly, and has given no trouble at all. It has been oiled regularly (about every 200 miles), and the chain removed a few times for cleaning and boiling in grease. The

On Smilesworth Moor, above Hawaby (Yorks.) near Sutton Bank, showing a sample of some of the roads over which the 3½ h.p. Brown has been tested. The Brown machine is shown at the back waiting its turn to be carried across the stream which was too deep to allow the machine to be pushed through.

chain has been run without any protection in all weathers, and although it looks the worse for wear, it should still be good for a lot more work. A chain cover would be an improvement, and also an adjustable bracket so that the slack of the chain could easily be taken up. Altogether the machine has been a success.

H.W.F.

The Sabella cyclecar, a recent competitor at Brooklands.

### CARELESSNESS OF PEDESTRIANS.

A case was recently heard in the King's Bench Division when a compositor sued the London General Omnibus Company for damages received through 'being knocked down by one of the defendants' omnibuses when crossing a road. The defendants denied negligence, and contended that the plaintiff did not keep a proper look-out and stepped in front of the motor omnibus. The jury returned a verdict for the defendants. While expressing our sympathy for the victim, we cannot help rejoicing at a verdict of this kind. The number of people who blindly step off the pavement in front of moving vehicles, be they donkey carts, taxicabs, or motor cycles, is quite surprising, and it is astounding that more accidents do not take place; in fact, it speaks marvels for the skill and care of the average motor vehicle driver. If everyone would keep as keen a look-out as all motor cyclists must do, there would be but few accidents.

### A Motor Cycle Radiator.

A radiator for use on motor cycles, having water-cooled engines, is of U shape, the water inlet A and outlet B being below the top of the device. The water enters at A, and travels up passages C D in either side of the radiator to the top tanks E, whence it falls by gravity through the restricted cooling chambers F to the lower pipe B. Filling caps G are provided as are also suitable spaces for the passage of bolts for securing the radiator to the machine.—Pendleton Radiator Co., Ltd., and A. L. Dunn, No. 25,866, 1911.

### A Decompressor.

The space into which the gas is compressed may be increased by the provision of a chamber A, which can be screwed into a valve cap or elsewhere. The chamber A is provided with a conical valve B, the spindle of which is screwed at C and provided with a handle D, whereby it may be rotated to open or close the valve B. A second valve E is provided, which is adapted to engage a seating F, so that there can be no leakage of gas due to a slack thread at C.—J. J. Rowe, No. 19,778, 1911.

### Tightening Inaccessible Nuts.

F. R. Archer, 7, Hosier Lane, Snow Hill, E.C., has acquired the sole rights of the well-known Ukantes driving spanner, which is specially designed for tightening inaccessible nuts.

### Cleaning Outfits.

The Nottingham Factoring Co. are selling the rotaball chain brushes, which will be found very useful at this time of the year for cleaning the transmission of chain-driven machines.

### Saddle Seats.

Not the least popular of the many lines made by J. B. Brooks, Ltd., Birmingham, is their motor cycle saddle seat, which has been selected as a standard fitment by several important motor cycle manufacturers for the 1913 season.

### Catalogues Received.

We are in receipt of the Bosch booklet containing coloured charts of the latest ZE1 waterproof motor cycle magneto. This booklet enables the reader to understand the working of the magneto, and every metal and material used is shown in a different colour.

### Air Cushions for Sidecars.

The Hutchinson Tyre Co., 70, Basinghall Street, E.C., have recently introduced various sizes of air cushions for use on sidecars and cyclecars. They are suitable for the seat or the back of the seating; one is also made as a foot cushion. Ladies will appreciate these pneumatic anti-vibrators.

### Decompressor Mechanism.

The valve tappet A is provided at its lower end with a foot B working through a slot in the tappet guide C. This guide can be rotated through a suitable angle by means of the lever D for the purpose of moving the foot B over a rocking lever E pivoted at F upon the same spindle as the ordinary valve lever G. The cam H is provided with a supplementary swell J, the swell H being in the plane of the lever G and that of J in the plane of the decompressor lever F. With the parts in the position illustrated ordinary running is obtained, the movement of the lever E by the swell J not being transmitted to the tappet A. When, however, the foot B is brought over the lever E by rotation of the guide C, movement of the lever E by the swell J raises the valve, this occurring on the compression stroke and allowing a portion of the charge to escape, thus providing easy starting.—G. H. Illston and H. A. Smith, No. 18,828, 1911.

## SPARKLETS

### The Veloce London Agency.

The Wilton Cycle Co., Wilton Road, S.W., have secured the sole London agency for the Veloce motor bicycle, the excellent running of which was lately referred to in these pages.

### A DOUBLE SEATED SIDECAR.

The passengers are seated back to back and it is arranged that the footrest may be folded up. This sidecar is made by E. Bowser of Leeds.

### A New Bat Frame.

To provide a more comfortable position than has hitherto been attained, the footboards A are arranged further forward, and pivoted to the frame at their

forward ends, as shown at B. The seat carrying tube C is shaped to correspond with the frame tube D. The links E are carried by springs F.—T. H. Tessier, No. 24,184, 1911.

### Cylinder Cleaning.

This cylinder has been designed to facilitate internal cleaning. The valve pockets A B are arranged on opposite sides. The cylinder head C is made convex, as shown, and the combustion space D is made of rounded form and free from recesses, enabling the cylinder to be cleaned by removing the valve caps and using suitable tools.—J. Weller, No. 26,270, 1911.

### Williamsons in London.

One of the latest model 8 h.p. Williamson motor cycles can be seen in London at the premises of Wauchopes, 9, Shoe Lane, Fleet Street, E.C.

### The Senior Hour Race at Brooklands.

J. L. E. Emerson's Norton which won The Motor Cycle challenge cup at Brooklands on the 12th inst. in the Senior Hour Championship was fitted with a Lyso belt, which fact has, of course, very much pleased the makers, The Lyceff Rawido Belt Co., Ltd., Bromley Street, Birmingham.

### Tyres for F.N. Motor Cycles.

Owners of F.N. motor bicycles as well as agents for this make of machine will be interested to know that they can obtain information as to Englebert tyres, which have been largely fitted to F.N. motor cycles, from Englebert Tyres, Ltd., 200, Great Portland Street, W.

### Excursions to the Paris Show.

The London, Brighton and South Coast Railway Co. will issue fifteen day excursion tickets to Paris on Fridays, December 6th, 13th, and 20th, and Saturdays, December 7th, 14th, and 21st. These excursions are being run in connection with the Paris Salon, which will be specially interesting this year on account of the number of light voiturettes which will be on view. Further particulars can be obtained from the Continental Traffic Manager, Victoria Station.

Telephone: 4601 City. Telegrams: "Rousillon, London." C.D.C.

## JUST THE TIME OF YEAR

when protection is required  
against wet and mud.

Extra mudguards may keep  
the rider clean, but they  
certainly do not prevent water  
carrying grit from working  
havoc in unprotected hubs  
and other bearings.

HUB LUBRICANT is recognised as an ideal  
lubricant for ball bearings. Its special  
value, however, is in the protection that it  
affords against the ingress of wet and mud.

Hub lubricant is now being  
generally adopted for bottom  
bracket two and three speed  
gear boxes such as Bowden,  
Clyno, Douglas, Chater Lea,  
F.N., Bradbury, and James.  
It is quite different to the  
usual gear grease.

Write for H. L. literature to—

**PRICE'S PATENT CANDLE CO. LTD.,**  
**BATTERLEE, LONDON, S.W.**

Hub Lubricant—post free—½lb. tins, 9d; 1lb. tins, 1/-

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular traders, advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

### SECTION II.

York and Lancashire.

### SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

### SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, and Warwick.

### SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

### SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembrokeshire.

### SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, and Channel Islands.

### SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

### SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

### SECTION X.

Scotland.

### SECTION XI.

Ireland and Isle of Man.

## THE II POINTS ON WHICH HATCHOPES SCORE

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. If for all transactions exceeding £10 in value a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Illife & Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR BICYCLES FOR SALE.

ESTABLISHED 20 YEARS "IN THE HEART OF THE TRADE"

Two-speed, two-stroke Scotts will be scarce after the Show. We foresaw this five or six months ago, and placed our 1913 contract then. Even now we shall probably be short of sufficient supplies for all our customers, so we strongly advise ordering early.

## BOOK YOUR SCOTT before the rush, earmark one from our (COLMORE) contract.

Remember the Scott not only has speed and power, evidenced by the result of the T.T. race, but it has complete reliability, proved by its splendid record in the great test of the year, the A.C.U. Six Days' Trial. Beyond this, it is distinguished from all other motor bicycles by its silence and comfort.

We have a few 1912 Scotts still to come from our 1912 contract (which was an all-the-year-round one, and does not expire for another few weeks). We are prepared to make exchanges or special terms for these late 1912 Scotts.

# COLMORE,

35, Colmore Row, Birmingham.  
261, Deansgate, Manchester.  
62, High St., Leicester.  
45, John Bright St., Birmingham.

Palmer and Kitson**, South-Eastern Gang Herne Hill, London, S.E., invite your attention to the underlisted machines, representing the best value (private or trade) obtainable: Rex Sidette 6-7 h.p., new (1912), £65; Rex, late 1911, 6 h.p., 2-speed, with Turner coach-built sidcar, £45; Zenith, May, 1912, h.p., like new, £60; Zenith, Aug., 1911, with sidcar 6 h.p., £58; B.S.A., late 1911, 3½ h.p., £38; three Roy Enfields, 1912, 2½ h.p. twins, 2 speeds, £38 each, like new; three Motosacoches, prices from £12, all in condition; N.S.U., late 1908, 3½ h.p., £16; Douglas, late 1910, £21; Bradbury, late 1911, gold medal winner, £28; Minerva, late model, 3½ h.p., £15; F.N., 4-cyl. F.E. clutch, £23; Minerva, 2½ h.p., £6; Olympic, 2½ h.p., £8; one Morgan and one N.S.U. runabout, full data on request; Simms twin mag., £3/10 (new); J.A. automatic car carburetter, £5; Bosch plugs, lamps, etc.; write us your requirements; full details on request willingly. We shall be pleased to hear from you. We are now booking orders for new season mounts. [X89]

## SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

**REX**, 3 h.p., in running order; what offers?—C. Gray jun., Willow Vale, Frome. [X89]

**1912 Free Engine Triumph**, slightly shop-soiled; but offers—Batten Bros., Cullompton. [X81]

**DOUGLAS**, 1911, single speed, £29; 1911 2-speed clutch, £35; 1912 T.T., £40.—Moffat, Yeovil. [53]

**1911 Kerry-Abingdon**, 2 speeds and free engine, perfect order; £35, or close offer.—Western, Uxbridge. [721]

**BRADBURY**, new, 1912, now in stock, 3½ h.p., N.S. 2-speed gear; £55, for £49.—E. Beech, Liskeard, Cornwall. [72]

**TRIUMPH**, 1910, only done 4,500, 1912 Matchless; any trial; £36.—Truscott, Moons Hill, Liskeard. [X84]

**1911 Douglas**, Model E., with Lucas lamp and generator, horn, spares, excellent order; £32/10.—B. ton, Shaftesbury. [X91]

**3½ h.p. Lincon**, acc., spring forks, 1910, B. and B. h.b.c., running order; £6/10.—Price, Wirel Station, Lizard. [70]

**BRADBURY**, 1910, 2-speed, not much used, good condition, splendid sidcar machine; £30 Duggan, Bulth Wells. [X90]

**1909 Triumph**, 1911 piston, good order, tyres excellent, Service belt; price £28/10.—Preston Bank House, Torrington. [X91]

**GUY and Reynolds**, Weymouth, have started the clearance sale of motor cycles, all machines guaranteed to be in sound condition, and will be sold on approval, deposit.

**INDIAN**, 4 h.p., clutch model, blue finish, guaranteed not run 400 miles, and as new; £35.

**BAT**, 4 h.p., fitted with P. and M. 2-speed gear, guaranteed perfect, would make a good sidcar machine; £33.

**PREMIER**, 3½ h.p., not run 100 miles, as new; £32/10.

**F.N.**, 2½ h.p., 2-speed gear, free engine, in good condition throughout; £20.

**MOTO-REVE**, in very good condition; £12.

**TRIUMPH**, 3½ h.p., 1912 clutch model, as new, 1 been run more than 100 miles; £50.

**FOR Sale**, Arno motor bicycle, 1912, property of officer going abroad, good condition; any trial appointment.—Apply, Holdsworth, Widdicombe House, Kingsbridge, S. Devon. [70]

**1910 Triumph**, with 1912 cyl. and piston, spare tube in case, F.R.S. lamp, spare cyl. and piston and other spares; trial or examination here, or ride 100 miles; £34.—Toms, Tremor, Withiel, Bodmin, Cornwall. [69]

**1912 Rover**, 3½ h.p., free engine, only done 1,200 miles, Dunlop tyres and belt, horn, battery, controlled waterproof Bosch, everything best condition; £48/10, or exchange lightweight twin, speeded.—John Bridgewater. [X87]

## SECTION X.

**Scotland**.  
**1912 Rover**, 3½ h.p., clutch model, almost new, £43.—Train, Charing Cross, Larkhall. [71]

**3½ h.p. 1909 Quadrant**, h.b.c., mag.; 3½ h.p. motor cycle, good condition, bargain, £12.—Lake, Dunfermline. [X91]

**2½ h.p. Hobart**, 1912, Armstrong 3-speed and free engine; £38.—Clarke, 10 Stevenson, 17, Well, Paisley. [X88]

**TRIUMPH**, 3½ h.p., free engine, 1911, valve, for etc., overhauled, without lamp; £34.—Paisley, Holm, Langholm. [69]

## Motor Cycle Taxation.

ON September 16th last a White Paper was issued containing the report of the Committee on the Horse-power Rating of Motor Cars. This Committee was not asked to make any suggestions for the increase, decrease, or alteration of existing motor cycle taxation. It went outside its terms of reference, and made a suggestion that the motor cycle rate should be amended by the addition of a cyclecar class. It also recommended that motor cycles should be taxed in future on the basis of motor car taxation, *i.e.*, on the bore of the engine.

We published the first article on the subject on the 19th September, and followed it with a leaderette on the 26th. Later the correspondence we received expressing indignation at the committee's recommendation prompted us to insert in the issue of October 3rd a petition form with a copy of a letter which it was suggested should be forwarded by readers to members of Parliament. A draft of the new regulations following the recommendations of the Committee has just been issued by the Treasury. This draft regulation does not contain any reference to increased or decreased taxation in connection with motor cycles, nor does it differentiate between cyclecars and any other form of small four-wheeled motor car. It deals only with motor cars.

In the House of Commons on the 24th inst. Mr. Cathcart Wason asked the Secretary to the Treasury "whether any proposals for the increase of taxation on motor cycles had been submitted to the Secretary to the Treasury, and are now under his consideration, and if he proposes to take any action thereon?" The Financial Secretary to the Treasury, Mr. Masterman, replied as follows: "The recent Committee on the Horse-power Rating of Motor Cars, in paragraph 9 of their report, suggested certain alterations which could not be carried out without legislation in the present system of taxation. My right hon. friend the Chancellor of the Exchequer has no present intention of taking action in the direction indicated."

This is reassuring, except for the word, "present" used in the last paragraph. If this had been omitted from Mr. Masterman's reply, the minds of motor cyclists would have been at rest, but with the word inserted it leaves it an open question whether the Treasury may or may not make suggestions later on for increased taxation should they consider it ex-

pedient. On the other hand, there is a remote possibility that the Treasury may be considering decreased taxation in connection with second-hand motor cycles, and we hope that is the intention.

The "direction indicated," referred to by the Financial Secretary to the Treasury, in his reply to Mr. Cathcart Wason, was, of course, the £1 tax for cyclecars with single-cylinder engines under 89 mm. bore and the taxation of motor cycles on the basis of motor car taxation. Motor cyclists all over the kingdom will rejoice with us that the absurd and incomplete recommendation of the Committee on Motor Car Taxation has so far been ignored by the Treasury, and we would even go further, and say that this recommendation should never have been made. The Committee was asked to consider motor car taxation, and went out of its way to make a recommendation with regard to motor cycles, which was not asked for. Whatever opinions the Committee as a body or its members individually may hold with regard to motor cycles, it had no excuse for suggesting any alteration to the taxation of motor cycles beyond the fact that it had heard the arguments advanced by the representative of the Auto Cycle Union, Mr. Archibald Sharp.

We assume the Committee acted in good faith, and thought that it was suggesting something that would remedy an injustice, but if the recommendation were directed at motor cycles of a certain type, weight, and horse-power, it appears almost like an attempt on the part of a few individuals to suppress motor cycles which do not conform to their opinions of what a motor cycle should be.

Although the Chancellor of the Exchequer has apparently no present intention of taking action in the direction indicated by the Committee, an official statement of the nature referred to above does not make *The Motor Cycle* petition any less valuable. The signatures of the petitioners with a draft of the petition will be sent to the Lords of the Treasury accompanied by a copy of the letter which we suggested should be forwarded to Parliamentary representatives. The petition will prove the indignation of motor cyclists regarding the Committee's recommendation, and the letter contains a suggestion for reducing the tax by one half for machines over two years old, a suggestion which we hope the Lords of the Treasury will consider.

## FORCED LUBRICATION.

### The Difference between Mechanically Fed and Forced Lubrication.

**I** HAVE lately been taking a series of test runs on forced lubrication machines, and probably my experiences will prove interesting to many. Forced lubrication is, however, in its infancy as regards its application to motor cycle engines, although for commercial machinery and motor car engines it has long proved a trusted method.

In the first place, it is necessary to differentiate between forced and mechanically fed lubrication. Such systems as induce oil into the crank case by utilising the partial vacuum formed therein can only be called mechanical feed. In this category fall the Indian system and devices employing spring-loaded pumps, such as the Best and Lloyd. That this is true one has only to consider what happens when the oil reaches the crank case—it is a case of ordinary splash lubrication obviously, but with the advantage over the ordinary hand pump that the amount of oil present is more uniform and approaches nearer to the requisite amount. Last Olympia Show really marked the coming of forced lubrication when the Veloce and W. and D. were exhibited. To take the Veloce first, here a small rotary pump driven off the magneto drive draws oil through a filter and sends a copious supply through a regulating tell-tale device to all the main bearings.

#### Two Examples of Forced Lubrication.

The oil also passes to the gears and clutches and is sprayed on to the connecting rod bearings and cylinder. The oil pressure is adjusted at the works to a figure which has been found most suitable—about 10 lbs. per square inch. The sump alone contains oil, and a filler is attached to it in a convenient position, all that the rider has to do being to fill the sump every 300 miles. Now as regards the running of this machine. With an engine of 70 x 76 mm. bore and stroke it easily takes two full-grown men up 1 in 7 from a standing start. Also running all out for miles on end never makes the cylinder more than comfortably hot. As for wear, 7,000 miles (1,000 of this with a sidecar) quite fails to make any appreciable difference in the bearings or clutch, while the piston and cylinder have merely acquired a fine polish.

Turning now to the W.D., we find here a small Albany type pump, which draws oil through a filter from a sump at the bottom of the crank case, much the same as the Veloce. The oil now passes through a regulating needle valve to a distribution chamber, thence through channels in the crank case to the main bearings. The main shaft on the timing gear side is drilled, and oil passes through the shaft, flywheel, and crank pin to the big end bearing, thence up a pipe fixed to the connecting rod to the gudgeon pin. Excess oil escapes from the bearings on to the flywheels and is flung on to the cylinder. In this case the bearings are floating on a film of oil, and under running conditions the two surfaces of the bearings are not in actual contact at all. Let the reader grasp this fact and he will see what a stride this is from the ordinary splash system. In fact, it is this forced lubrication system which has made the modern high speed commercial steam engine possible.

#### Another Advantage.

I also saw an engine in which the bearings had been damaged owing to the presence of aluminium filings on the wrong side of the filter, and here, although the bearings were known to be very slack indeed, when running it was quite impossible to tell this, there being no vestige of knocking or rattling. On the road the W.D. proved also phenomenally cool, although the compression of the particular mount I bestrode was 85 lbs. per square inch and the speed was high.

Points in common were that both machines had a peculiarly silky feel about their running; this is doubtless due to the comparatively small amount of friction. In both cases the power developed seemed to be a little above the average, showing at least that the work done in circulating the oil is no drain on the engine power. The real advantages, however, are the small amount of wear and the absolute fool-proofness of the working parts of the lubrication systems.

It will be interesting to watch the progress of this type of lubrication, and the coming Olympia Show should prove instructive in this respect.

# OCCASIONAL COMMENTS

by "IXION"

## Top Tube Toolbags.

One of my faddist friends called round last week and showed me a notion which is not protected, and is worth the attention of the trade. He started with the conviction that the top of the tank was the correct place for toolbags, partly because the space was otherwise wasted, partly because road vibration reaches its zenith at the tail of the carrier, and carrier panniers need very careful packing if the tools are not to jangle. Consequently he procured a standard "top tube bag," but he soon found it too small to be of any practical use.

After one or two experiments he fitted a long bag with four compartments. At the forward end he carries spare plugs and valves; just abaft of this he stores his tyre repair kit and belt adjusting kit in separate compartments; and the long stern division houses his big tools. The whole outfit was very neat and compact, in spite of the fact that all his clips had to be bolted on. He pointed out that if flat brackets were brazed to the top tube, a large comprehensive outfit could be most handily mounted in this position.

## The Life of Epicyclic Hubs.

My request for information as to the wearing life of epicyclic hubs has not elicited much evidence. Three-speed users have been quite inarticulate, and I have received no particulars of more value than my own experience. Early in the year I arranged for a Sturmey-Archer and an Armstrong hub to be fitted to  $3\frac{1}{2}$  h.p. machines under my observation, and to be worked hard, with and without sidecars. Both hubs are still running, and neither has ever given a mite of trouble or cost a penny in repairs. At one time the clutch of the Sturmey was somewhat inclined to slip, but this proved to be due to the rider's failure to comprehend the clutch adjustment; when he got the hang of the Manx ha'penny device on the right hand end of the spindle, the clutch gripped like a good 'un. Both these hubs have done many thousands of miles; I will endeavour to acquaint readers with their subsequent history, but they are going strong at present, and have proved delicious investments. My correspondents confine themselves to two makes of two-speed hub, and some of the letters do not appear to be entirely disinterested. Some of the distances are too short to be conclusive, but none of them talk trouble. Mr. Squire, of Sheffield, does not come in this category. He bought a 1909  $5\frac{1}{2}$  h.p. Roc two-speeder second-hand in 1910, and has run it 13,600 miles with only three road stops to tighten the high gear band. His sole objections are that it requires an hour to remove and replace the wheel, and that there is a slight chatter on low gear (a failing of many speed hubs). His repair bill is more than reasonable, viz., overhaul and new axle, 21s.; new brake drum and rebuilding wheel, 21s.; pair of cones, 3s.; pair Hoff-

mann bearings, 17s.; one hub pinion, 8s. 6d.; nine dozen brass studs, 9s.; total, £3 19s. 6d., a very creditable record. Several other riders speak of the B.S.A. two-speed hub in the highest terms. Altogether the correspondence entirely confirms my own experience, viz., that the epicyclic hub has now reached the stage when it is absolutely reliable, embodies a minimum of friction, and proves exceedingly durable in prolonged wear. Several readers comment with delight on the noble fashion in which a modern air-cooled engine stands up to its work under exhausting spells of hauling heavy sidecar outfits on the low ratios. Overheating is comparatively unknown, and the face of the exhaust valve pits but slowly.

## Another Query.

A correspondent writes saying that he is keenly interested in the medium-powered machine, indicating the 350 c.c. singles and twins. He says he is informed that their high-speed engines do not yet wear as well as a  $3\frac{1}{2}$  h.p., and that loose bearings appear too soon, while valve troubles are unduly frequent. I have not yet attempted to run one of these handy machines to destruction, my own experience of them being practically confined to 500 mile tests of a few leading types, during which I could collect no exhaustive evidence. I imagine that a new type requires time to come into its own, and it is scarcely to be expected that miniature engines should solve the metallurgical problems which still hamper their bigger sisters, but I am sure he need not expect an unreasonable amount of trouble. Perhaps one or two users who have driven a 350 c.c. engine a distance of 10,000 miles will send their repair bills to the Editor? The results should be interesting.

AT THE TOP OF PEN-Y-BALL.

H. W. Coupland (3 h.p. Williamson sidecar) at the top of this noted Welsh hill, which has several times lately been used for hill-climbing contests.

## COLLAPSIBLE SIDECARS.

Two ingenious attachments designed to overcome the storage difficulty.

EVER since the sidecar and its predecessor, the tricar, have been introduced, the difficulty of storage has always been present to the user who has not the necessary premises at his disposal. The first collapsible motor cycle brought to our notice

was a folding tricar, described in *The Motor Cycle* a couple of years ago, which was the invention of Mr. Browning. Mr. Browning, finding that the tricar was falling into disuse, he then devoted his attention to the sidecar, and succeeded in bringing out a very clever model, which was exhibited at the last motor cycle show.

### The Browning Sidecar.

Since that time he has constructed several machines, and recently his invention was taken up by Mr. R. Gordon Barrett, 54, Florence Road, Stroud Green, N. To fold up the sidecar so that it will

pass through a narrow doorway, two clips holding down the forward portion of the sidecar springs are undone. The type of clip used throughout is that shown in the third illustration, consisting of a clip and bolt combined, which is absolutely secure and free from rattle. The rearward portion of the sidecar springs is provided with a wedge to fit into a specially cut groove, which can be seen in the same picture. The body can now be pulled forward and lifted off. When the body is removed

two more patent clips are undone, one attaching the long diagonal member of the sidecar to the down tube of the motor cycle, and the other fastening the lateral portion of the frame to the tube supporting the side-

The Browning folding sidecar passing through a narrow doorway.

Chassis design of the Browning.

car axle. This allows the lateral portion, together with the long tube attached to the down tube of the motor bicycle, to be lifted up, and the wheel is free to swing close up against the motor bicycle, the whole pivoting on the rod attached to a special bracket situated behind the saddle of the motor bicycle. By undoing this latter fastening the whole sidecar can be lifted away from the machine if required. It is therefore unnecessary to detach the sidecar completely to pass through a narrow door, as is shown in first illustration. The second picture shows a further advantage of the attachment, which is not at once apparent, and that is, that by undoing one clip the sidecar may be swung round, allowing the near side of the machine to be accessible for repairs or adjustments. All these operations may be effected without the aid of tools. The sidecar cannot get out of alignment, however many times it is detached and attached. The sidecar is guaranteed for two years, and is made in two types, the Standard and De Luxe.

Showing how the sidecar swings outwards.

Showing motor and sidecar being wheeled out of an entry.

THE COLLAPSIBLE SIDECAR, MADE BY THE PATENT COLLAPSIBLE SIDECAR CO.

The second one of this folding type is manufactured by the Patent Collapsible Sidecar Company, 129, Conybere Street, Birmingham. The photographs show the machine in various stages of collapsibility. The annexed illustrations render the operation of this ingeniously thought out sidecar quite clear.

One of these reproductions, showing the complete machine passing through a narrow doorway, should appeal to owners who have lack of storage room.

Both these devices are distinctly ingenious and, to use a hackneyed expression undoubtedly supply a long-felt want.

## COMPULSORY SILENCE.

ON careful examination the new draft regulation of the Local Government Board regarding the use of cut-outs appears to me to be open to very severe criticism. To my mind there is ample evidence that this regulation has been drawn up hurriedly, or carelessly, or both, by one who has little or no knowledge of motor cycles, or even of the Motor Car Act of 1903. The draft reads as follows: "He shall not use any cut-out, fitting, or other apparatus or device which will allow the exhaust gases from the engine of the motor car (motor cycle) to escape into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance suitable and sufficient for reducing as far as may reasonably be practicable the noise which could otherwise be caused by the escape of the said gases."

### No Regulations Necessary.

The first argument against such a measure becoming law is that it is totally unnecessary. That alone shows the want of intelligence, or even knowledge of existing law, on the part of the person or persons responsible for the regulation. For under the 1903 Act the owner of a motor vehicle which is objectionably noisy is liable to conviction. Therefore is the law stands at present the police have the remedy in their own hands. What the L.G.B. should have done if they wished the silencer regulation enforced more strictly was to put pressure on the police to remind them that this clause of the 1903 Act was not merely a dead letter. The whole case is analogous to the law as to the speed limit. The police have all powers to arrest anyone whose driving is dangerous to the public, therefore why impose a limit of speed at all? Everyone admits the absurdity of the speed limit, even many police, yet the L.G.B. in their enlightenment propose a regulation equally futile.

Then how will this regulation work in practice? Many riders, the majority in fact, drive with their cut-outs open on country roads when clear, and closed in towns and villages and when near horses. Make the cut-out illegal, and see what happens. The motor cyclist must obey the law, and he must have efficiency. He therefore takes the obvious course of riding a machine which is just sufficiently silent to escape trouble with the police. And this will mean that his machine is probably considerably less silent than it used to be when he shut the cut-out. It is not noisy enough to create trouble, but that does not mean that degree of silence possible on many 1912 machines, for no one minds a little back pressure for town riding if he have a free exhaust for fast work on the open road. The silencer of 1913 will be neither free nor silent if the regulation come into force.

### A Really Silent Machine.

Many people regard a really silent motor cycle or car as dangerous, and should we get the real silence by this regulation (which, as I have said above, I do not think likely) I believe their fears will prove to have been well founded. Further, the public prefer a machine they can hear, all the time, to a dead silent machine with a horn or exhaust whistle going. Nothing annoys people more than to be startled by a motor horn; when they hear the machine coming and move on of their own accord they do not seem to mind.

What we want, and what I trust we shall get under a reasonable Government, is freedom to use our cut-outs at our own discretion, with heavy penalties for those who make nuisances of themselves. This latter is highly necessary. The only good that I can see likely to arise from the draft regulation is that it may draw more attention to silencer design, and may ultimately give us a really free silencer.

RED WHEELS.

# A LEADING FRENCH CYCLECAR.

Detailed drawings and a trial of the four-cylinder Baby Peugeot.

THE illustrations of the Baby Peugeot published in a recent issue gave an excellent impression of the outline of the vehicle, and we now reproduce line drawings of the chassis showing the disposition of the parts and the mechanism.

The engine crankshaft is solid, and the crank case is divided into two compartments communicating by means of holes. Oil is fed to the base by gravity through a drip feed lubricator with two pipes passing each to one division of the crank case. The base is almost rectangular, and is attached direct to the frame, which is of pressed steel, and passes right under the engine, forming at the same time a mudshield. The valves are mechanically operated,

Plan view of the chassis, showing disposition of parts.

wheel shaft. A Claudel automatic motor cycle carburetter feeds the engine perfectly, and is placed on the right just behind the magneto. The engine (which is 55 x 90 mm.), magneto, carburetter, and water pump weigh complete 188 lbs., which is, we should think, about the lightest form of four-cylinder water cooled engine unit on the market.

The clutch is of the leather-covered cone type, the external part forming the flywheel.

## The Two-speed Gear.

Behind the clutch is a two-speed gear contained in a round casing, which connects up to the rear axle by means of a torque tube. This gear is quite a departure. The tubular torque rod is, of course, a fixture; through its centre runs a revolving tube and a solid rod. These connect by means of bevel pinions at their rearward extremities to two bevel crown wheels on the driving axle. It will therefore be seen that there is always one set of bevels driving and one set running idly, the change of gear being effected by clutching either the tubular or solid shaft to the clutch-shaft by means of a sliding dog, which is really a disc carrying internal and external cut teeth, which mesh with keys or flutes on the engine-shaft and gearshafts.

A reverse is provided by a pinion not in mesh unless required. When it is necessary to travel backwards this pinion is brought into mesh with the low gear-shaft by a Bowden wire, and causes a reverse motion.

The universal joint connecting the clutch and propeller-shafts is simply a leather

disc, which allows for a slight motion every direction.

The front axle is of I section, dropped below the starting handle, and the steering is irreversible by screw and sector

Part sectional view of the four-cylinder engine. It will be noted that the valves are on each side of the cylinder, and valves, springs, tappets, etc., work in oil, the aluminium cover plates being fitted to the cylinder with an oil-tight joint.

and situate each side, covered completely in such manner that the tappets and springs work in an oil bath. The timing gear is across the front of the engine, and the pinions and wheels are alternate bronze and fibre. The water circulating pump and the Bosch magneto are gear-driven off a continuation of the timing

The Timing Diagram. I.O. Inlet open., E.S. Exhaust shut, D.C.T. Dead centre top, I.C. Inlet close, D.C.B. Dead centre bottom, E.O. Exhaust open.

## The Suspension.

One of the most interesting and practical features of the vehicle is the Truffault suspension, a most practical device, which the springing of the little car vastly improved. Roughly described, Truffault is a friction device which provides for big shocks by letting the wheel back again gently, after they have been suddenly jerked upwards by bad roads. The rear springs are semi-elliptic, and the front springs are merely attached to the frame where the dumb irons are usually placed.

The frame is cranked upwards at rear and narrowed in front to allow sufficient lock. The wheels are small 22in. x 2½in.—but one would never know

Plan sectional view of the Truffault shock absorber, also side views, showing how the suspension is fitted to the front and rear wheels. The left hand elevation is for front wheel and the right hand for the rear wheel. This device allows the road wheel to return slowly to its place when suddenly lifted by shocks. The damping action is caused by a frictional pad of leather gripped between metal discs.

**A Leading French Cyclecar.—**

They were unduly small owing to the delightfully easy running of the Truffault suspension.

The control is very simple. There are no levers on the steering wheel, an accelerator pedal opens and closes the throttle, and side levers and pedal working inside the body operate the internal expanding brakes and change of gear. The brakes are operated by pedal and lever independent of one another.

The body is of metal, torpedo shaped,

and upholstered in leather, the petrol tank is cunningly hid in the back of the seat, and holds about six gallons, and the consumption is about 40 m.p.g.

The chassis weighs complete about 6½ cwt., and the complete car has a hood, screen, two Ducellier lamps for acetylene gas, and a horn.

**A Short Run.**

The makers took our representative for a short run in the Bois de Boulogne, and afterwards up a hill called the Côte de Valerien. This hill is about a kilometre

in length and has a maximum gradient of 1 in 9, and an average of 1 in 12. The Baby went up at about 18 to 20 m.p.h. on the low speed, and has a maximum high speed of about 37 to 38 m.p.h. On tour, we were informed, it would average nearly 25 m.p.h.

Side and front elevations of the four-cylinder Baby Peugeot voiturette, showing method of control, tubular torque rod, clutch, and oil tank. The petrol tank in rear seat is not shown.

## Alldays Midget and Other Models.

**A**LLDAYS and Onions, Ltd., Birmingham, showed us last week an entirely new 8 h.p. twin sidcar model, also the Alldays Midget. There will be little alteration in the 8 h.p. single-cylinder model for next year, except that it will have a countershaft three-speed gear with the first chain running in an oil bath. This car is of the sliding type.

**A Sidcar Machine.**

The 8 h.p. twin has an engine the cylinders of which are 85×88 mm. bore and stroke set at an angle of 90°. The cranks are also at 90° with the connecting rods working on separate journals. The flywheels are internal. Both valves are mechanically operated side by side. The magneto, which is on the left-hand side and behind the engine, is gear-driven off one of the

cam wheels. The gear is similar to that on the 3½ h.p. machine. On the engine-shaft is a metal-to-metal cone clutch. Lubrication is by hand pump.

The Midget has been on the road upwards of 7,000 miles this year, and Alldays and Onions have decided to make 500 of them. The engine is a water-cooled single-cylinder 4½ in. bore × 4½ in. stroke with external flywheel and solid crankshaft. The magneto is fitted on the right side and is chain-driven, the chain running in an oil bath case. Lubrication of the engine is effected by a mechanically operated pump which pumps the oil up from a sump in the crank case through the bearings of the engine, etc., and then returns the oil to the tank. Where the oil issues from the bearings it falls to the base and is splashed from there on to the cylinder

walls. A cone clutch transmits the power to a three-speed gear box of the sliding type, the top ratio being direct driven.

**Worm Drive and Differential.**

From the gear box a propeller-shaft conveys the power to a worm-driven rear axle, the worm and wheel being below the axle. The box containing the worm gear and differential is provided with an oil filler so placed that when filling up an overflow device prevents too much lubricant remaining in the box. To enable the propeller-shaft to assume a horizontal position, the engine, gear box, etc., are carried on an underframe of steel tubing, which obviates inclining the engine. The frame on which the body rests is of channel steel.

Two expanding and contracting brakes are fitted to each rear wheel. The steering is irreversible by worm wheel and sector. The springing is by means of four semi-elliptical springs, which are free to turn about their centres on pins attached to the frame. The front axle is of stamped I section steel. A tubular torque rod connects the gear box and rear axle, and in it revolves the propeller-shaft. The steel wings are rounded in section, and pass well around the circumference of the wheels. Pedals operate the clutch and brakes, and the Victoria body seats two passengers. The total weight of this little vehicle is about 7½ cwt., and it will attain a maximum speed of thirty-eight miles per hour.

Mr. R. Surridge wishes us to inform readers that he regrets anyone having trouble with his solution flask, as it was only after a large number had been sent out that a fault was discovered. Previous purchasers of the flask can obtain a new one if they send a postcard to 58, George Street, Camberwell.

The Alldays Midget car, which is propelled by a single-cylinder water-cooled engine.

## An Ingenious Two-cycle Engine.

**A** TWO-STROKE engine possessing many novel features has been designed by Mr. Karl M. Gibbons, of Basford Hall, Stoke-upon-Trent. Unlike the usual type of two-cycle engine, in which the gases are transferred from the crank case to the cylinder by means of a port cast in the cylinder walls, this engine allows the gas to pass through a valve in the piston head. This valve is mechanically operated by means of a cam mounted on the crank pin and a tappet carried inside the hollow connecting rod. The cam is arranged to point directly to the centre of the crankshaft, so that every time the piston nears the bottom of its stroke, *i.e.* when the crank case compression is almost at its highest, the cam comes into action and the compressed gas passes through the valve and is deflected upwards by the shape of the piston in such a manner that it does not mix with the exhaust gas, but assists it out through the exhaust ports.

### High Engine Speeds.

The engine has a bore and stroke of 88 mm., and a compression of 90 lbs. per square inch. There are twelve exhaust ports of  $\frac{5}{16}$  in.  $\times$   $\frac{5}{16}$  in. and the engine is said to reach 4,000 r.p.m. The cylinder has been machined from a solid mild steel bar, and in future will probably be water-cooled.

At the present time the engine has undergone a test of about 200 miles, and has developed great power. So far the valve spring tension has not been adversely affected by the heat. The inlet valve should not require grinding any more frequently than that on a four-stroke engine, but should it become necessary it is a comparatively simple job, as the valve

can easily be detached by means of a special tool.

As will be seen from the drawings and photographs the gas (supplied by a Senspray carburettor) is drawn direct into the crank chamber through an automatic valve. The crank case compression has been raised by the addition of aluminium plates where space existed

Cylinder and crank case, showing aluminium plates used to raise crank case compression.

which could be filled up. Oil is led to a groove at the base of the cylinder, thence to the main bearing through ducts, and thence by centrifugal force to the inside of the crank pin, which is drilled to allow oil to reach the big end.

The engine was manufactured by W. Tagg and Co. Newcastle-under-Lyme.

### A COMPLAINT ABOUT MOTOR CYCLISTS.

A serious complaint has been received by the R.A.C. from a member resident in Bedfordshire of the disagreeable way in which motor cycles are driven by irresponsible persons through certain Bedfordshire villages. Recently a farmer whose horse was frightened by a passing motor cyclist was thrown out of his cart and his shoulder broken. R.A.C. road guides will be stationed in villages in which fast driving has been noticed, to report the behaviour of any offenders. In Bedfordshire there have never been any police controls, and ten-mile limits are unknown; therefore the abuse of the privileges offered by a county which is notably friendly is highly to be deprecated.

Sectional views of Mr. Gibbons's two-stroke engine.

# BOWDEN VALVE GRINDER.

## The Value of Compression.

It is impossible to over-estimate the value of perfect compression.

Compression cannot remain perfect unless your valves are regularly ground in.

Valve grinding has been sadly neglected in the majority of motor cycles because it has hitherto been an irksome and irritating operation.

If you knew of a cheap tool which would enable you to grind in your valves, simply, perfectly, without dismantling the cylinder, with no more trouble than you at present take in giving your tyres an occasional pumpful of air, you would not sacrifice that amount of power which must be lost through imperfect compression.

# BROOKS to-day, & — BROOKS to-morrow.

Has it ever struck you how very subject to saddle change and substitution is the man who does not ride a BROOKS?

And have you noticed how very seldom the man who rides a BROOKS to-day rides another make to-morrow?

Of course there is a reason—

It is this—

There is no other saddle which yields the same degree of comfort—none other which maintains its comfort-giving qualities from the first day of its fitting to the last day of its use as does the BROOKS—none other which can embody the BROOKS Patent Compound Springs—the secret of its luxury.

Hence — “BROOKS to-day, and BROOKS to-morrow.”

Anyway, you should put it to the test and make comparison, and note—

That all our latest models will be on view at

**STAND 231  
Gallery, OLYMPIA,**

where we shall be delighted to demonstrate their value.

## 1913 MODELS.

Advance Details and Illustrations of  
New Model Motor Cycles.

### 1913 ROVER TOURING MACHINE.

THE Rover Co., Ltd., have found their present models so satisfactory, as proved by achievements in competition, that they do not intend to make any radical changes; they are, however, modifying all their types. We have been privileged to examine the first of the new touring  $3\frac{1}{2}$  h.p. models, and found that several minor improvements had been carried out. The petrol tank has an increased capacity and neatly rounded corners, the top and bottom edges being enamelled

1913 Rover tank, showing cylindrical oil compartment and glass-topped filler caps.

black with the usual Rover red panel on aluminium ground between. The tank is now supported by two brackets from the under side, and a steel pressing let into it forms a non-leakable oil compartment. The top bar of the frame has been slightly raised to accommodate the larger tank, but the saddle height remains the same. Sidecar lugs are now brazed to the frame, and the company are constructing a sidecar of their own. The  $85 \times 88$  mm. engine remains practically the same,

though some of the bearing surfaces have been increased, and the machine we inspected was fitted with a neat Rover leg guard round the valve chest. A large diameter silencer is fitted under the

The new Armstrong gear is fitted to the rear wheel, which is covered by a wide, quickly-detachable mudguard attached to the carrier. Substantial stands are fitted to each wheel. Great care has been

The new  $3\frac{1}{2}$  h.p. Rover, with Armstrong three-speed gear.

bottom bracket, to which the gases are led by a long pipe and have their egress through another pipe of smaller diameter on the opposite side. This silencer is, however, at present in its experimental stage, and may be somewhat modified.

bestowed on the design of the brakes; the front has an improved type of shoe fitted, while the leverage to the rear brake has been materially increased.

The model illustrated is not finished in the standard colours, but gives a good idea of the lines of the Rover Company's latest production.

Belt side of the  $3\frac{1}{2}$  h.p. Rover described on this page.

### THE JAMES THREE-SPEED GEAR.

A FEW weeks ago we published an account of a long distance trial on a 1913 model  $3\frac{1}{2}$  h.p. James and sidecar, and we are now able to publish sectional drawings of the three-speed gear employed on this mount. The sprocket A is driven direct from the engine by means of a chain, and transmits power through the clutch plates C to the shaft B. The central portion of this shaft is splined and carries the sliding gear pinion D, which has dogs E and E' machined at either end. On either side of the splined portion of the shaft lie the idle wheels F and G having corresponding dogs E, and E' respectively. In the case of the wheel F, the dogs consist of semi-circular recesses machined in the face of the wheel. Directly above the mainshaft B lies the layshaft H carrying the three gear wheels J K and L. To obtain the high gear the dogs

Section of the 1913 James' 3-speed gear box and striking mechanism.

E<sub>1</sub> are engaged, thus locking the shaft B to the idle wheel F. It will be noted that splined on to an extension of F is the driving sprocket. Thus the shaft B is locked to the sprocket M, and, since it is driven by the sprocket A, a direct drive is obtained. The middle gear is obtained by meshing the wheel D with the wheel K. The drive is then as follows: From D to K, then back from J to F, thence to M, a further movement of D to the right engages the dogs E or the low gear. By locking the wheel G to the shaft JB, the drive is then from G to L, from J to F, and thence to M. In each case the sprocket M drives the rear wheel through a single roller chain. The gear box is mounted throughout on Skefko ball bearings, with the exception of a double cone race carrying the wheel F, which takes any slight side thrust that may be caused by the striking mechanism. A kick starter is encased in the right side of the gear box, and consists of a toothed quadrant N, which may be rotated by a pedal P, under which circumstances it engages with the gear wheel O mounted on a free-wheel device carried by the mainshaft. The gear runs quietly and changes simply, and the ratios are worked out so that there is not too big a difference between them.

#### THE LATEST CALCOTT.

THE 2½ h.p. Calcott has been considerably modified for the coming year. The 70×76 mm. m.o.i.v. engine is retained, but the cylinder is offset ⅞ in. and is constructed with much deeper radiating fins and larger valves. The timing gear has been greatly simplified, all wheels being held in position by a phosphor bronze plate, so that the cover may be taken off without disturbing the timing. It is worthy of

Valve lifter mechanism and adjustable tappet on the 1913 Calcott.

note that the timing gear shafts are held stationary, the wheels only revolving on phosphor bronze bushes. Adjustable tappets are fitted to the new model, and a neat form of valve lifter which consists of an inclined face which forces the

exhaust tappets upwards. The frame has been improved in details, and the engine is carried at the rear by a stout cradle. The mudguard stays are carried on separate pins, so that they in no way impede the detachment of the wheels. A

Calcott engine which has an offset cylinder.

simple spring-up stand is fitted to the rear wheel. The carrier has been strengthened, and two pannier bags are fitted close in so as not to give a clumsy appearance to the machine. The tank has a rounded top and is fitted with a glass topped petrol filter, the whole being supported by platforms brazed to the lower tube. The Calcott is obtainable either as a single-gear mount, or with a three-speed to order.

The firm have under construction a 4½ h.p. machine of 89 mm. bore×60 mm. stroke; the cylinder will not be offset, but in other respects it is a large edition of the 2½ h.p. model.

This machine should prove itself to be an extremely satisfactory one for sidecar-work in hilly districts.

Adjustable tappet of twin 7-9 h.p. Premier

New 2½ h.p. Calcott single-speed machines.

### THE CRESCENT CYCLECAR.

**W**E recently had the pleasure of inspecting the Crescent cyclecar, which is being built and marketed by Crescent Motors, Ltd., of Pleck Road, Walsall. The firm started operations in 1910, and after two years' experimental work they have evolved a machine that not only comes within the A.C.U. definition of a cyclecar, but what is still more important, one that is designed and priced on the lines of what to the majority of people the word cyclecar means.

The Crescent is friction driven, this form of transmission having been proved satisfactory over lengthy tests carried out by the manufacturers. The standard pattern two-seated side-by-side body is both comfortable and spacious, the inside dimensions of the seats being 37in. wide, 21in. high, and 16in. deep.

An 8 h.p. V-type J.A.P. engine (85 by 85 mm.), placed longitudinally in the frame under a bonnet at the front of the

The latest Crescent cyclecar which now has sociable seats.

brakes, which are operated by the clutch pedal; depressing the clutch pedal first holds apart the two friction discs, and further depression applies the band brakes on the front wheels. It may be added that besides the clutch pedal there is another pedal which operates the throttle, and underneath the steering column there is one lever to control the timing of the Bosch magneto by means of a Bowden wire. The carburetter is an Amac automatic, which dispenses with the necessity for an air lever.

#### Appearance and Springing.

The chassis is carried on semi-elliptical springs fore and aft, and a tubular frame is used. It runs on 26in. wire wheels fitted with 2½in. voiturette rims and tyres. The wheelbase is 7ft. 9in., the track 3ft. 2in., and the ground clearance 8½in.

It will be gathered from the accompanying illustration that the complete machine presents a particularly smart appearance. The bonnet merges into the scuttle dash, which contains the petrol and oil tanks, in a very neat manner, and the lines of the body harmonise with both. Domed mudguards and running boards not only

further enhance the car's appearance, but are fittings which are useful and appreciated by the owner.

A short run we had on the car demonstrated its stability and good springing—indeed, the extremely comfortable manner in which it held the road without any discomfort to the occupants at high speeds over a bad surface was most impressive.

Showing the friction drive, tubular frame, and rear springing of the 1913 Crescent.

chassis, supplies the motive power. It is air-cooled, and a dummy radiator is fitted to enhance the appearance of the car. In addition to a vane flywheel, a two-blade fan is driven off the driving shaft immediately behind the engine. From the engine a long propeller-shaft transmits the power to the friction discs, the driving disc being carried on the end of the shaft and the driven disc on a counter-shaft. From the counter-shaft a short single chain transmits the power to the live back axle.

#### Five Speeds and Reverse.

Although, of course, a friction drive is really a variable gear, notches are formed in the change speed quadrant to give five forward speeds and one reverse. The combined change speed and brake lever works in a gate and quadrant, the latter being utilised for changing speed. The notches are in the quadrant and the lever being moved through the gate into a slot which is at the side of the change speed notches, applies a band brake to the counter-shaft. In this way the counter-shaft brake cannot be applied without first putting the gear into neutral, and one lever operates the change speed and one brake. This latter remark also applies to the front wheel

Power unit of the Crescent. The engine is an 8 h.p. air-cooled twin.

The efficiency of the friction drive for this class of vehicle was also demonstrated, especially when the car was driven up a short stretch of road with a loose cobbly surface having a reputed gradient of 1 in 4.5.

#### F.R.S. LAMPS.

Samuel Hall and Sons, Wrotesley Street, Birmingham, showed us a few days ago a special generator made for cyclecars, which holds 1½ lbs. of carbide. This is a very neat and light generator considering its size. It works on the ordinary F.R.S. drip feed principle, and has the firm's riddling grid. They are also making a complete set of cyclecar electric head, side, and tail lamps. These are also suitable for any small car, and are egg-shaped. The following—the Major, the Big, and the 5in. sizes for motor cycles—will be continued in an improved form. An additional model is a new lightweight head light and generator. All are fitted with genuine Mangin lenses. The generators for 1913 are both smaller and neater than before. F.R.S. lamps will be found at the Olympia Cycle and Motor Cycle Show on the stand of their principal agents, the Service Co., Ltd.

An example of the water-cooled Green-Precision 85 x 88 mm. engine. This engine holds the single-cylinder sidecar records, having covered 50 miles 1,740 yards in an hour—an excellent performance.

### THE MATCHLESS.

A RECENT visit to Messrs. Collier and Sons' Works, Plumstead Road, Woolwich, revealed a good deal that was of interest. The successful 8 h.p. passenger machine with double belt drive and epicyclic gear in the rear hub will be retained, while a few detail improvements will be added. An innovation, however, will be an 8 h.p. chain-driven passenger model. The drive is by chain to the counter-shaft, and thence by two chains to the rear wheel. The change-speed is in a small gear box in the bottom bracket containing dog clutches, which engage the low or high speed chains as required. Also, on the counter-shaft, there is mounted a friction clutch, consisting of two internal expanding wedge-shaped rings, the wedges having an angle of 90°. Oil from a bypass from the main supply to the engine lubricates the clutch, and any excess, therefore, is directed on to the front chain, which runs in an aluminium case; guards are provided for the back chains. A segment type kick-starter is used. The rear brake is of the internal expanding type, and is lined with Ferodo. The machine is of thoroughly practical design, but it must be remembered that the particular one illustrated herewith is an early model of the new type, and the chain case and guards have been removed.

Another new model will be the 3½ h.p. twin with overhead valves. The transmission from engine to counter-shaft will be by enclosed chain, and thence by belt to the rear wheel which will be built on to an Armstrong three-speed hub. The six-speed model with expanding pulley gear and sliding back wheel to preserve an even belt tension will be retained.

### The Matchless Cyclecar.

Quite a novelty, which has been awaited for some time, will be the 9 h.p. Matchless cyclecar, which is the result of two years' careful experimenting. It is now approaching completion, but will not be ready till just before the Show. Belt drive was tried in the early models and found wanting, and the final type is now a three-wheeled vehicle. The motive power will be a 90° J.A.P. 85 × 95 mm. engine fired by Bosch magneto. The

The new two-speed Matchless-Jap, with chain transmission throughout.

clutch will be of the leather-faced cone type. Long bolts extending through the

Garrard Maxfield 1913 model sidecar, with hood complete.

crank case also hold the gear box, rendering engine, clutch and gear box one unit.

Behind the gear box will be a well-made De Dion type universal joint with a grease-retaining cone. From gear box to the rear wheel the drive will be by propeller-shaft, while the final drive is by bevel. The chief bugbear of the three-wheeler, the inaccessibility of the back wheel, will be absent, as the latter will be detached almost instantly by merely withdrawing the spindle. The back wheel is then free to drop out, leaving the driving mechanism and the brake drum *in situ*. These two portions are connected to the main hub by means of dog clutches. Geared steering is fitted, the gear box being situated on the top of the steering column immediately beneath the wheel. The frame is of channel steel, while the rear wheel is carried in a tubular sub-frame, and is connected to the main frame by leaf springs attached to the latter at their after ends. The centre of the front axle is curved, and serves as a cradle for the engine, which is mounted longitudinally. Laminated springs extend from each extremity of this curve to vertical plungers, supporting the stub axles and running in guides on the main frame, thus ensuring good springing and ample lateral stability. In a word, the springing is somewhat after the system in vogue on the Sizaire-Naudin car. The track is 56in., and the wheelbase 7ft. The cylindrical petrol tank is carried over the engine and possesses a compartment for oil. The gear box contains two speeds, and the top gear ratio is 4½ to 1. 650 × 65 mm. voiturette tyres are to be fitted to the front wheels, while the rear wheel will be shod with a 700 × 85 mm. combination cover. Altogether, the Matchless cyclecar will be one of the most up-to-date three-wheeled vehicles on the market.

### SIDECARS A SPECIALITY.

Hoods for sidecars are manufactured by the Garrard-Maxfield Motor Manufacturing Co., Ltd., 5-6, Aston Road, Birmingham. We illustrate the 1913 pattern sidecar made by this firm complete with Cape hood. These sidecars are also fitted with side curtains and front celluloid screen to order. The company have already supplied a number to France.

Instantaneous sidecar couplings are also a feature of the Garrard sidecar.

The 1913 8 h.p. chain-driven Matchless sidecar combination.

## 1913 REX.

It has not been found necessary to make any great changes in the twin-cylinder 6 h.p. Rex. The bore and stroke,  $77\frac{1}{2} \times 95$  mm., remain the same, and the only alteration of any

importance to the power unit lies in the timing gear, which has been considerably simplified. It will be remembered that an oil pipe leads from the crank case into each of the inlet valve chambers. The gear is unaltered, and the chief improvements in the frame lie in the lengthening of the ball head and a slightly increased rake to the steering. The leverage on the rear brake has been increased, and the V brake drum replaced by a flat

Pressure pump for Rex oil tank.

one. The mudguards have been much improved, and the side flaps extend right round the front guard. Another innovation lies in the method of lubrication, which is by air pressure. A small hand pump is let into the oil filler cap, by means of which air is forced into the tank. This drives the oil out through an adjustable sight feed drip to the engine. Either belt or chain drive can be supplied.

The company has produced a solidly constructed sidecar for use with this machine, the design of which may be clearly followed from the photograph. It will be seen that there are four points of attachment, a cross-bar being fixed to the engine plates in front of the crank case. The chassis is constructed for lasting wear, and the body is beautifully sprung, and is supported on coil springs in addition to the usual leaf springs.

The most striking feature of the  $3\frac{1}{2}$  h.p. model is the belt guard, which extends round the pulley and underneath the belt

Re-designed Rex sidecar chassis with four-point attachment. The front clip extends to the engine cradle.

to the rear rim, as may be seen from the photograph. We have advocated this fitting in these pages for a long time past, and the Rex Co. are to be congratulated on being the first firm to make it a standard fitting. The model we illustrate is fitted with a metal-to-metal cone clutch

neat and light contrivance. The engine has a bore and stroke of  $84\frac{1}{2} \times 95$  mm., and may be started by a handle fixed on the rear stay and connected to the hub by chain. Both types are fitted with a front wheel stand and a novel handle-bar clip, which is keyed to the head pillar and clips the handle-bar which may be set at any angle.

Rex handle-bar lug, which is keyed on to the pillar and clips the bars, so that they may be set in any position.

in the rear wheel. This clutch consists of two metal cones, which are forced against corresponding coned surfaces in the hub shell. The whole forms a particularly

## ANOTHER MOTOR CYCLE LAMP.

Messrs. Blériot, Ltd., Long Acre, W.C., are turning their attention to the manufacture of motor cycle lamps, and we learn that they have already designed a motor cycle head light and generator. The former will be of the lens mirror type, and the latter will be made on the diving bell system, following the pattern of one of their generators for car lamps, which has been found to be absolutely satisfactory. One of its chief points is its great accessibility, allowing it to be taken apart quickly, thus rendering cleaning particularly easy. The lamp, which will not be ready for delivery for some time, will undoubtedly be a good production worthy of the name of Blériot. It will be of British manufacture.

## WEAR OF EPICYCLIC HUB GEARS:

At the Rex Co.'s works recently an epicyclic gear was shown to us which their draughtsman, Mr. H. Sargisson, has had in use from 1906 to the present date. For the last eighteen months the machine has been in use with a sidecar and the original gear pinions are still good. Mr. Sargisson thinks this is conclusive proof that "Ixion's" query about epicyclic gears is well answered. Of course parts of the gear changing mechanism have been renewed from time to time, but the original hub and pinions have never been replaced. The gear pinions of the Rex two-speed gear are very much larger than those of the three-speed hubs which are popular on motor cycles, but we see no reason why these latter should wear any quicker than a pedal cycle hub three-speed gear, which, as is well known, has a life practically equal to that of the bicycle.

1913 pattern 4 h.p. Rex. Observe the footboards and efficient belt guard.

# AUTUMN ONE DAY RELIABILITY TRIAL

A SEVERE TEST IN LAKELAND.

**Q**UITE the most severe one day trial which has yet been held by the Auto Cycle Union started from Kendal on Saturday morning last. The entries amounted to fifty-eight, and of these the non-starters were L. Pennington (A.J.S.), J. Pass (Clyde), and F. Fisher (8 Chater-Lea sc.). Harry Reed, who had entered in the bicycle class, had a sidecar attached to his 8 h.p. Dot.

Immediately on leaving the garage a turn to the left was taken up quite a steep hill, which was a foretaste of what was to come. The surface was excellent on the 1 in 5 portion, but at the very summit—the hill was a mile long—it was very greasy. Thereafter for a spell the roads were good, but interspersed with steep pitches. Then a sharp turn to the left was taken and a by-lane followed which called for careful negotiation. Shortly we came on a watersplash just deep enough to souse the belts, and on the narrow bridge by which it could be avoided a marshal was stationed. Then the main road was entered, and thereafter the going was excellent. There had been a white frost in the night, and the morning broke fine, though somewhat misty. Snow lay on the mountain tops and ice in the puddles on the road. The fog had been so bad in the Midlands the day before, and everyone dreaded it and talked of nothing else the previous evening, that it was a relief when it was seen that all that remained of it was a slight haze over the mountains. The first hill after Kendal—Brigsteer—was encountered after the watersplash, and, though steep and tricky, it was as nothing in comparison with Tow Top; nor yet was Duke's Hill, which, owing to the nature of its approach, was strongly reminiscent of Byber's in the Six Days' Trial.

Map of the course of the A.C.U. Autumn One-day Trial.

Low Top was approached suddenly from the main road. It consisted of a series of sharp corners with a maximum gradient of 1 in 4 and a surface of loose granite. It was the first real test of the day, and accounted for many failures. Newsome (Rover), Noble (Rover), Horsman (Singer), and Alexander, jun. (Indian), all came up in good form. Beal (N.S.U.) dismounted and ran. Norris and Lee (New Imperials) both dismounted. Braithwaite (Rudge) got up, but Gilbanks (Douglas) dismounted. Bennison (W.D.) was balked and brought to a standstill by an inconsiderate non-competitor, who did not appear to be at all concerned at what he had done.

On our suggestion, the judges present (Messrs. Greenhill and Little) allowed him another try, on which occasion he was successful. Ratcliff (B.S.A.) dismounted. De la Heay and Greenwood, both mounted on the new Sunbeams, made

Starting the first two—D. H. Noble and C. T. Newsome (3i Rovers) who both made non-stop runs and were two of but five to climb Blea Tarn Pass.

steady and sure ascents. Walker (Monarch) went up steadily. Tessier (Bat) and Busby (Alldays) made excellent ascents. Underhill (Monarch) and Wilkins (P. and M.) came to a stop. Moffatt (Zenith), Clow (Zenith), Newey (Ariel), North (Ariel), Thornton (Swan), and Ball (Triumph) all came up in good form. Kerr (N.S.U.) skidded and stopped. Hardee (Triumph) came up well. Ross (Triumph) failed. Harry Reed (Dot sc.) came up in excellent style. Mrs. Hardee (P. and M.), Pratt and Shaw (P. and M.'s), Walker (Rudge), and Rowlandson (Rudge) all came up in a bunch. Lester (P. and M.) and Mrs. Hardee both failed, but by a remarkably clever piece of steering Rowlandson cleverly threaded his way through the tangle. Walker (Monarch) and Oliphant (Premier) failed. Harrison (Rudge) made a good climb, and Crawley (Triumph) came up very well indeed. Rothwell (Douglas) came to a stop, and on someone asking him if he was looking for them (hills presumably) he remarked, "I'm not looking for any thing, but when I conks out I conks out." Gray (Rudge) came up well, but assisted slightly with his feet. Morgan (Morgan runabout) made a splendid climb. The arrival of the Humberette was eagerly awaited, but unfortunately it

## TOW TOP, A STEEP AND STONY ZIGZAG CLIMB.

Hal Harrison (3½ h.p. Rudge-Multi) passing stranded competitors.

T. C. De la Heay on one of the two Sunbeams, followed by A. H. Ratcliff (3½ h.p. B.S.A.)

came to a standstill. Anyhow it left barely room for Mundy (G.W.K.) to get by, but the latter, by dint of skilful handling, made an excellent ascent. South (long stroke Rudge sc.) went up well with the passenger leaning over the carrier. Chater-Lea, jun. (Chater-Lea sc.), F. Smith (Clyno sc.), and Keiller and Wood (G.W.K.'s) all made excellent ascents. Dixon (New Hudson sc.), and Eames and Munday (A.C.'s) came to a standstill. Tessier (Bat) probably made the best ascent of the solo machine riders.

Tow Top was a good test and a fair one, and a pleasing contrast to what was to follow in the afternoon, but to this we shall refer later.

From Tow Top the course continued over undulating and twisty roads, necessitating a watchful eye ahead. The picturesque views were much enjoyed. Soon after Staveley a sharp turn was taken to the right up Gummers How and Strawberry Bank, long ascents through woodlands, culminating in a pitch of 1 in 5 or 6, which was covered with loose stones. The highest point is 1,054 feet above sea level, and the view of Windermere from the top is a sight to be

remembered. Here many met their Waterloo. The Rovers, Sunbeams, Horsman's Singer, Crawley's Triumph, the Ariels, and the Indians made fine climbs, but Beal came to a full stop, his little N.S.U. twin being geared much too high for such a severe trial. J. A. Lee (New Imperial) stopped, as also P. N. Gilbanks (Douglas), H. C. Wilkins, and C. Lester (P. and M.'s) and the Humberette. V. Underhill (3½ h.p. Monarch) failed simply because he had to use his feet for steadying himself, and his low gear happens to be foot operated.

Among the best performances may be mentioned S. T. Tessier (twin Bat), who tore up the gradient at over 25 m.p.h. (wobbling badly on the loose stones), S. A. Rowlandson (Rudge), W. Pratt (P. and M.), and J. Oliphant (Premier). A. H. Ratcliff (B.S.A.) just got up by dint of clutch slipping. Of the passenger machines, R. G. Mundy (G.W.K.) went up neatly with none too much power in hand; the Morgan, which steered a remarkably straight course; and H. G. Dixon (New Hudson), whose performance with an 85 x 88 mm. engine, geared 11¼ to 1 on the low, was an eye-opener to the knot of spectators assembled on the hill. The Chater-Lea and

A G.W.K. (driven by C. M. Keiller) rounding the first bend on "The Struggle," Kirkstone Pass.

The Humberette (driven by S. Wright) nearing the summit of Kirkstone Pass.

**Autumn One-day Reliability Trial.—**

Clyno sidecars made sure climbs. Harry Reed, though he had ample power, could not use it owing to the loose surface; still he got up successfully.

Mrs. Hardee suffered a sooted plug in the lower reaches of the hill, and so elected to retire, as also did T. J. Ross, who could not get a low enough ratio on his Triumph with N.S.U. gear.

**Ascent of Kirkstone Pass.**

Through Winster and Bowness, over less difficult roads, a magnificent run was enjoyed by the side of Windermere to Ambleside. Here the riders halted for a moment or two at the arranged check, and then commenced the ascent of Kirkstone Pass. In some respects this momentary halt was to be regretted, as the engines had a chance to cool. Kirkstone, however, is long enough to test the coolness of running of the best engines, for, commencing with a real hairpin, it is long and after over a mile of real climbing the last stretch zigzags for a quarter of a mile on a single figure gradient. To make matters worse the road had recently been covered with stones, thick mud being used as the binding material. A track of about 2ft. was cleared for the solo mounts or more would have stopped.

Most of those who had performed conspicuously on the previous test hills were again to the front, so we need not mention them individually. Those who stopped included Beal, Nixon, and Moffatt.

The passenger machines suffered badly. Reed's belt jumped off, the two A.C.'s could not get sufficient grip for their back wheels, whilst H. G. Dixon came to a standstill momentarily; his engine, nevertheless, pulled like a Trojan, and with the passenger's weight over the back wheel the machine picked up again. J. Chater-Lea was rather hindered by the Clyno, which was pegging away steadily in the middle of the road, but there was no room to pass. Both got up well. South's 750 c.c. Rudge-multi sidecar had a low gear of 7 to 1 only, and though the new long-stroke engine tugged gamely it was touch and go on the steep section.

A right angle bend through a gateway. Eric Walker (4<sup>th</sup> Mon arch) on the way to Blea Tarn.

The trio of G.W.K.'s made very creditable performances.

As we descended Kirkstone we could not help feeling how far the French road engineer was ahead of his English cousin in the actual engineering of the road, and how far behind him in road surface. However, to spread thick mud and stones on an important pass like Kirkstone is not road mending, although it only extended for 20 or 30 yards.

—SCENE ON BLEA TARN PASS, which was climbed by only five competitors. This test hill was subsequently ruled out owing to the impossible state of the surface. In our opinion the hill should never have been included.

**Autumn One-day Reliability Trial.—**

Presently the pretty little lake known as Brothers' Water came into view, and next beautiful Ullswater, whence there was a glorious glimpse back over the mountains through which we had just come. In this section Harry Reed suffered a puncture and South had the fastener pull through the belt. The final run into Keswick was over magnificent roads, but was marred by endless flocks of sheep. Ilvellyn, which towered on the left, had its summit covered with a sprinkling of snow. The last climb before lunch was up to Druid's Corner. The lunch which was served in the Royal Oak Hotel was of the very best. Among those who had retired in the section before lunch was Underhill (Monarch), whose hub gear seized near Scarfoot. Alec Ross was in charge at Keswick. About a mile from Keswick

(Premier), and Ball (Triumph). The view from the top of Red Bank was very fine, as it overlooked Grasneve and the mountains behind.

The roads continued to be excellent for the most part, but they were particularly narrow in the neighbourhood of Great Langdale. Over two or three miniature "Ballig Bridges," round right-angle turns, through gates, and over a road through a meadow, the competitors struck the *pièce de résistance* of the trial, viz., Blea Tarn Pass, called after one of the many tarns of that name.

**A Well Nigh Impossible Climb.**

Here the ascent zigzagged with an average gradient of 1 in 6½ and a maximum of 1 in 3 (according to the local surveyor), but what troubled the riders was the loose sur-

General view of the last stretch of Kirkstone Pass. The competitor in front is A. G. Eames (A.C.), followed by H. C. Munday on a similar machine. Our photographer was standing on the road above the bend for this picture, which will give some idea of its winding nature.

there was a long hill which was quite steep at the foot and then rather easier. On the summit of this the wind began to make itself felt, and from here on it blew a gale in the face of the riders, who, skirting pretty Thirlmere, had to battle against it on their way to the Langdale district. However, the machines took little notice of Dunmail Raise, despite the heavy wind. Red Bank, the second timed hill, was the next item of interest. It was fairly steep, rather greasy, and possessing a watercourse half-way up. The first few riders took it with ease. Among these we may mention the two Rovers, Tessier (Bat), the two Alexanders and their Indians, the two Sunbeams, Bushy (Alldays), Horsman (Singer), North (Ariel), Newey (Ariel), Walker (Monarch), Wilkins (Zenith), Braithwaite (Rudge), Shaw (P. and M.), Rowlandson (Rudge), Pratt (P. and M.), Lester (P. and M.)—the P. and M.'s were particularly quiet—Lee (Imperial), Ratcliff (B.S.A.), Clow (Zenith), Gray (Rudge), Oliphant

race of soft earth and stones, which provided no adhesion for the tyres. Big ruts were soon churned up by the wheels. The scene at this hill has never been equalled in our experience of reliability trials. It could be likened to a battlefield, for all the way up riders were struggling with their machines to prevent them running backwards, others had been hastily dragged aside to make way, and at one point not more than two hundred yards from the foot there was a bunch of five or six. When the two leaders, Newsome and Noble, on three-speed Rovers, came along and got up with foot assistance at the first time of asking, followed by No. 5, J. R. Alexander, jun. (7 Indian), it was thought that the climb would not trouble the competitors so much. Lakeland motor cyclists had gathered here in force in anticipation of seeing some fun. We gathered that they were jealous of the fuss made of Porlock in the Six Days' Trials, and all were keen on proving that

**Autumn One-day Reliability Trial.—**

the Lake District boasts one better. But whether it is a fair climb—ask the fallen ones. The successful riders say yes. Our own opinion is that it was distinctly unfair, simply because it was not a matter of engine power, but only the lack of surface for the driving wheels to grip, which caused all the failures.

For nearly half an hour the competitors continued to fall off their machines, some having two or three attempts without success, but still one more was destined to show the way to the summit, and this was Crawley on the Triumph, fitted with a Sturmey-Archer gear. He started well, but was soon performing weird gyrations, his front wheel first pointing one way and then the other as the back wheel slewed round. He stuck pluckily to his task, and his effort was rewarded with success. But it was a most exciting and daring exhibition not unattended with risks. Several riders performed remarkable evolutions in determined attempts to retain their non-stop records. Tessier's Bat was really fast, but a huge skid landed the rider in the bank. F. C. North got near the top, but his back wheel suddenly slid from under him, and in a second his machine shot up a bank. G. D. Hardee ran off the road and charged G. N. Norris, who had removed his machine several yards on to the grass. Poor Pratt was much upset when he was brought to a stop, and there were many others who said nasty things about the man who selected such a hill. There is no disguising that fact that the so-called test was a farce.

The passenger machines were eagerly awaited, but all were doomed to failure, though Frank Smith must be given the credit for the best showing. He got over the worst part by dint of much jockeying and other extraordinary methods, but on the last bend but one he ran on to loose surface, and the Clyno's wheels stepped, though the engine at once picked up again after willing watchers had given him a push off. South (Rudge) pulled his belt through, and was equally unfortunate at the next attempt.

**The Run Home.**

As the rear guard of the competitors were leaving Blea Tarn it began to rain, and the mountains were left shrouded in mist. The little Tarn giving its name to the now famous hill looked dreary in the extreme. The road surface was better, though the descent on the other side was steep and winding. One other hill had to be surmounted, and this was Foolstop, a few miles from Ambleside. It was fairly short, but very steep, and accounted for about a dozen failures. The rain became worse and the roads were soon very wet and greasy. At Ambleside, at the White Lion Hotel. *The Motor Cycle* provided tea for the competitors—an institution which, some are good enough to say, is much appreciated. There was a good deal of grumbling about Blea Tarn which the

Competitors springing themselves out on Blea Tarn Pass. The three depicted skidded into each other. Observe the state of the surface which accounts solely for so many failures.

officials duly took into account, and after the conclusion of the trial the following notice was posted in the official hotel:

"Owing to the surface of Blea Tarn Pass having churned up worse than was anticipated, the judges have decided that failures on this hill shall not be recorded as a stop, and a latitude of ten minutes will be allowed in consequence at Kendal. On the other hand the certificates of those who made specially meritorious ascents of Blea Tarn Pass will be endorsed to that effect.

Especially good climbs were made by C. T. Newsome (3½ Rover), D. H. Nohle (3½ Rover), J. R. Alexander (7 Indian), V. Busby (3½ Alldays), and S. Crawley (3½ Triumph); meritorious climbs by P. Shaw (3½ P. and M.), S. A. Rowlandson (3½ Rudge), and F. Smith (5-6 Clyno)."

The trial was a great success and splendidly organised. Not an arrow was missing, and the marshalling was excellent. The only mistake was the inclusion of Blea Tarn, and that the officials remedied.

(1) A cheerful failure on Kirkstone Pass.

(2) F. Smith (Clyno) on Kirkstone Pass.

## LIST OF COMPETITORS AND THEIR PERFORMANCES.

## BICYCLE CLASS.

Rider, H.P., and Make of Machine. *Denotes private owners.	No. of Cyls.	Bore and Stroke.	Cubic Capa- city.	Gear.	Remarks.

J. T. Wood (8 G.W.K.) .....	2	86 × 92	1068	G.W.K. ....	Non-stop.
Sam Wright (8 Humberette) .....	2	84 × 90	998	Humber ..	Stopped on Tow Top, Kirkstone and Red Bank
A. G. Eames (5-6 A.C. sociable) .....	1	95 × 102	732	A.C. ....	Stopped on Kirkstone and Foolstop.
H. C. Munday (5-6 A.C. sociable) .....	1	95 × 102	732	A.C. ....	Stopped on Kirkstone and Foolstop.
H. G. Dixon (3½ New Hudson sidecar)	1	85 × 88	499	Armstrong	Stopped on Bank Head, puncture and broken valve.
C. M. Keiffer (8 G.W.K.) .....	2	86 × 92	1068	G.W.K. ....	One stop, missed gear change.
W. D. South (5 Rudge sidecar) .....	1	85 × 132	750	Rudge ....	Three stops for belt, failed Foolstop.

## Autumn Trial Notes.

Which is the more difficult climb, Blea Tarn Pass or Porlock in the mud? Most consider that the former is.

It was almost certain that the Lakeland terror would be ruled out. Even a motor bicycle of 1920 may not succeed unless the surface be altered.

Some said the first arrivals at the Pass had the best chance of success, owing to the surface being more even. Seeing that Nos. 1, 2, and 5 got up, there may be something in this, but Busby was No. 26 and Crawley 44. All five successful soloists, of course, trailed their feet to steady themselves. There was no such thing as an absolutely clean ascent of Blea Tarn.

Dixon made an exceedingly plucky attempt to take his 3½ New Hudson sc. through the trial. Several times he succeeded when solo riders of machines fitted with engines of the same size came to a standstill.

The Humberette was much admired. In each case the stops on hills were due to the clutch refusing to grip, the engine all the time running splendidly.

A useful suggestion emanating from Mr. H. F. S. Morgan was that before a surprisingly steep hill is definitely selected that a 15 h.p. car should be sent up. If it be unclimbable by a good 15 h.p., it should not be included in the trial.

### Autumn Trial Notes.—

The two 7 h.p. Indians, ridden by the Brothers Alexander, had beautifully clean engines at the finish of the trial.

Why did the officials ignore at the luncheon interval the regulation regarding filling up with water?

Some rode nearly five hundred miles to compete in the trial. Mrs. Hardee, for instance, rode her P. and M. from town, along the Great North Road to Kendal *via* Skipton and Settle.

Our staff were mounted on Triumph and Douglas machines, which acquitted themselves remarkably well. The Triumph was practically a 1913 model with Sturmey-Archer gear and other refinements, including a new and efficient silencer, which will form the subject of an article in these pages shortly.

With the course so severe, including hills with single figure gradients every twenty miles at least, it is not surprising that the percentage of non-stops was low. Nineteen out of fifty-four starters gained non-stop certificates.

Even the panting and crestfallen competitors on Blea Tarn Pass could not refrain from remarking upon the gorgeous view.

Many started back by road from Kendal, but owing to drenching rain most decided to take train after reaching a town where the service was good.

Odds were offered before the trial that no machine would get up Blea Tarn. A number who had faith that their machines would climb anything willingly accepted the wager, and were poorer on Saturday night.

Another trial like Saturday's in the Lake District will put a stopper on amateur entries. A number whose machines were somewhat battered were asking themselves where the fun came in on such indescribable hill surfaces.

Harry Reed's Dot-Jap was fitted with a three-speed counter-shaft gear, the first drive being by chain and the second by belt.

The first few miles of the course were through extremely narrow lanes; two sidecars or cyclecars could not possibly have passed. One description of the route was that it resembled the edge of an enormous saw, the competitors riding up and down the teeth.

The two Rover riders, D. H. Noble and C. T. Newsome, who were the first two competitors to make an ascent of Blea Tarn Pass.

Our thanks are due to Rex Mundy, who took one of our staff as passenger on the G.W.K. No. 47. We thoroughly enjoyed the run, and our opinion of the friction drive was enhanced thereby.

If rumour be true, someone has invented an indicator which will automatically register all stops in road trials. Mr. Loughborough told us he had long ago suggested an indicator to register the average speed throughout a trial. A combination of the two in one instrument would save a lot of trouble.

ASCENDING TOW TOP.

W. D. South on the 750 c.c. Rudge Multi and sidecar.

H. F. S. Morgan (Morgan runabout), who as usual made a non-stop run.

## A Twin Two-stroke Vertical Engine.

JUST about a year ago we gave a description of the Stuart-Turner two-stroke motor bicycle, the forerunner of the improved type we are about to describe. The new model, which will be handled exclusively by Messrs. R. G. Nye and Co., Hampstead Road, N.W., is a particularly interesting machine and a pleasing departure from standard practice. It is designed specially for sidecar work. The engine, which develops 8 h.p., is a two-stroke, and has a bore and stroke of 78x82 mm. The cylinders, which are placed tandem fashion, are two in number, so that an impulse is given every revolution, and are water-cooled. The two cylinders form a monobloc casting, the top of the water-jacket being a detachable aluminium plate, so that the water-spaces may be easily cleaned out. The crank case and gear box form a single unit. The clutch, which is contained in the flywheel, is situated inside the crank case

the ordinary sliding universal joints which are fitted suffice. The worm appears to be of somewhat larger dimensions than would be expected on a motor cycle, but this is not actually the case, as the chief reason for its big appearance is the size of the ball thrust behind it, which is designed so as to be fully up to the work it will have to do.

A belt rim is attached to the rear wheel, acting solely as a bearing surface for the rear brake. The worm is self-

The tandem type twin-cylinder two-stroke engine, also rear frame of the new Stuart.

The back wheel and worm drive.

and is of the multi-disc type. The crankshaft is in two portions. The first part, turned out of the solid, has the balance weights shrunk on and pinned, while the second portion is built on to the first, and the balance weight forms an integral portion thereof.

### Two-speed Gear Box.

The gear box provides two speeds, the change being effected by means of sliding dogs. In our illustration of the partly finished power unit the further vertical shaft is the gear-striking rod, which is operated by a lever working fore and aft situated adjacent to the tank. To the shaft, projecting horizontally from the after end of the gear box, the chain sprocket connected up to the kick starter is fitted. To the other shaft, projecting above the gear box, the clutch pedal is attached, as this operates the clutch fork. The gear box and final drive, which is by worm, are connected by a short propeller-shaft. This is almost in line, so that

The 1913 Stuart-Turner transmission, showing crankshaft, flywheel, plate clutch and gears.

contained, and allows the back wheel to be withdrawn after undoing two or three nuts. Adjustable footrests, which may be altered to suit the rider's convenience, are supplied. Ball bearings are fitted throughout, and these are provided with the Stuart-Turner patent frictionless air and oil-tight sleeves, which have been previously described in *The Motor Cycle*.

The oil is fed from the tank through a drip feed, by pressure from the crank case to the cylinder walls and base chamber. The petrol tank contains two gallons, while an Amac carburettor and Druid forks are supplied. The frame is of strong construction, and has the top tube dropped at the rear. The magneto is carried behind the engine, and is driven off the gears by a Coventry Silent chain, which runs through a slot in the gear box shown in the photograph. This slot is covered by a small aluminium dome.

Our illustrations of the power unit, showing the thermosyphon circulation and honeycomb radiator, and the sketch of the crankshaft and transmission system, demonstrate that the machine is neatly and simply designed. It is manufactured by a firm of engineers of long experience.

F. C. North (3½ Ariel), who made an exceedingly plucky attempt to climb Blea Tarn Pass. He had reached the last bend when his machine leaped sideways and mounted the bank as seen in the photograph.

## CURRENT CHAT.

## TIME TO LIGHT LAMPS.

Oct. 31st	...	...	5.34 p.m.
Nov. 2nd	...	...	5.30 "
" 4th	...	...	5.27 "
" 6th	...	...	5.23 "

## Rivington Pike Hill-climb.

Mr. Phillpott writes that in Class II. for single-cylinder sidecars on formula, Hugh Gibson (3½ Bradbury) gained third position.

## A.C.U. Autumn Trial.

The excellent photographs of the above trial, reproduced in this issue, were taken by one of our staff photographers, who, as usual, accompanied the competitors mounted on his motor bicycle.

## Motor Cycle Cut-outs.

The President of the Local Government Board was asked in the House of Commons last week if he were in a position to state the steps that he has taken with a view to prohibiting the use of cut-outs or open exhausts on motor cycles.

Mr. Burns's reply was that an order on the subject had been drafted, and he hoped to be in a position to come to a decision in the matter at an early date.

## Motor Cycles at the Front.

In addition to the specially fitted up F.N. illustrated on the next page for the use of a cinematograph operator at the Balkan war, Messrs. Collier and Sons have supplied a Matchless motor cycle for a similar purpose to MM. Pathé Frères. That company's operator will be with the Bulgarian Army.

## Successful Year's Trading.

The report of the directors of the Rover Co., Ltd., Coventry, which will be presented to the shareholders at the works, Coventry, on Monday next, shows a trading profit of £57,680. Out of this sum it is proposed to allot £13,057 to pay a 10% dividend. £10,000 will be written off goodwill and patents, £8,000 off plant, and £13,499 will be carried forward.

## Dinner and Presentation to G. E. Stanley.

On Friday evening G. E. Stanley, the hero of the hour record was entertained to dinner by Singer and Co., Ltd., Mr. W. E. Bullock (works manager) presiding. Several congratulatory telegrams were read from well-wishers of the firm. On behalf of the Singer Co., Ltd., the Chairman presented Mr. Stanley with a cheque and gold watch bearing the following inscription. Presented to G. E.

## COLLAPSIBLE SIDECARS.

Stanley by Singer and Co., Ltd., in recognition of his many fine performances on Singer motor cycles." His health was then drunk with musical honours. The Chairman humorously explained to those present that it was partly due to Stanley finding the correct cam in an old suit of clothes that the record was secured; a similar but improved cam to the one used was passed round for inspection, and on it were stamped the words "Singer and Co., 1913, 90 miles an hour."

## Benevolent Fund Dinner.

On Thursday evening last the annual dinner of the Motor and Cycle Trades Benevolent Fund was held at the Connaught Rooms, Great Queen Street. Mr. Albert Brown presided.

## First Details of 1913 Models.

This week's issue contains the first illustrated descriptions of:

The new Crouch carette.

The 1913 Rex single and sidecar.

Two improved types of collapsible sidecars.

The 1913 Calcott.

New chain-driven Matchless.

James three-speed gear.

Chassis view and details of the Baby cyclecar.

Alldays Midget car.

Stuart two-stroke twin.

Detailed drawings of Baby Peugeot.

## Brooklands Note.

We are asked to state that F. H. Arnott is not the head of the Rudge racing stable, and has no connection with the firm.

## The Stanley-Bailey Match.

S. L. Bailey writes us a long letter which, unfortunately, we have not space to reproduce *in extenso*, from which it appears that he (Bailey) desired the match run off on October 12th at the B.M.C.R.C. meeting, and pressed for this date. Subsequently, Mr. Bullock, of the Singer Co., said that under no circumstances would Stanley ride the match until he annexed the hour record. Mr. Bailey asks, "Why should I await their convenience, especially as I have other work in hand far more important than a match with Mr. Stanley? When this is completed, I assure your readers I shall not be afraid of the new four (or even fourteen) valve engine." Mr. Bailey then misquotes statements from *The Motor Cycle*, but points out that the special Douglas he is preparing, with light tyres and wheels, will attain a speed of 70 m.p.h. Finally, Mr. Bailey assures us that, so far as the match is concerned, he will use a standard T.T. Douglas.

THE AUTUMN TRIAL IN LAKELAND. H. G. Dixon (New Hudson and sidecar) rounding one of the bends on Kirkstone Pass. The state of the surface will be noted.

A2 1/2 h.p. F.N., equipped in two days, for use at the Front in the Balkans. This was ordered by the Gaumont Film Company after a careful investigation of the merits. In addition to the weight of the operator and some hundreds of pounds of baggage, the machine is taking a sidecar with other kit. It will be used by a Cinematograph operator to obtain war pictures.

### 1913 Models.

A correspondent recently noticed H. A. Collier on the Sevenoaks Road on an 8 h.p. chain-driven Matchless with sidecar and passenger. This rather looks like chain-drive on Matchless machines in 1913.

### Proposed Club for I.O.M.

A meeting of motor cyclists has been held at the Marine Hotel, Peel, to discuss the advisability of forming a motor cycle club for the Isle of Man. There are nearly 100 motor cyclists in the island, but, as yet, no organisation to look after their interests.

### Stolen Machines.

The following machine was stolen last week from a shed at Whittington Barracks, near Lichfield: 1912 New Hudson, three-speed gear, J.A.P. engine (13866), frame 3172, registration number E1729. Lieut. Blackburn offers a reward of £10 to anyone who gives information which will lead to its recovery.

### French Hour Record.

Grapperon, riding a motor cycle with Anzani engine, 85 x 87 mm., 494 c.c., set up a new unofficial French hour record at the Parc des Princes track, Paris, on Friday last. The distance ridden was 52.98 miles. The performance is not official, because the A.C.F. has declined to recognise motor cycle track records accomplished in private tests. Grapperon should come to Brooklands and see if he can approach G. E. Stanley's latest figures. Fourteen and threequarter miles will be the extra distance Grapperon will have to ride in an hour to tie with the British hour record.

### A.A. and M.U. Notes.

**ROAD WARNING.**—Several complaints have been lodged with regard to the speed of motor cycles and cars between Little Heath and Hatfield, and unless more consideration is shown, the police will have no alternative but to institute controls.

### Regrettable Accidents.

Two serious accidents occurred to motor cyclists last week. Frank Philipp, secretary of the Scott Engineering Co., Bradford, collided with a car, and the impact was so violent that the car owner was thrown out and killed, Philipp sustaining a broken leg and other injuries.

E. B. Roper, of Sheffield, was driving a sidecar on a lonely road in Lincolnshire last Friday evening in the fog, when he came into collision with a car and was instantly killed. J. W. Wheatley, jun., also of Sheffield, was the passenger in the sidecar, and he was badly injured about the head, but it is expected that he will recover.

### Alternative Road from Warrington to Preston.

Motorists who have travelled north and south by way of the West Coast road well know the difficulties of the usual road between Warrington and Preston, which, for the most part, runs through busy and unlovely manufacturing centres in which there are many miles of tramlines with much congested traffic. The R.A.C. has had mapped out an alternative road, avoiding practically all these difficulties, nearly all of which is very good, and passes through pleasant country. This alternative road is now being signposted between a point south of Warrington and Preston, so that every motorist will be able to have the advantage of the club's experience. Of course, it is impossible to avoid travelling through Warrington, but in doing so it is not necessary to drive through the centre of the town, and in carrying out the work the Club is signposting an alternative road.

### News.

A recent programme of the Mersey Motor Club states, among other things: "The most businesslike and up-to-date and go ahead motor club in this or any other district."

### Marriage of Well Known Motor Cyclists.

"From now Muriel Hind is Mrs. R. Lord." Such is the wording of a telegram received at our office last week. "Dick" Lord will be recollected as the Rex rider. We extend our heartiest congratulations. We understand Mr. and Mrs. Lord will reside near Coventry.

### Spanish Motor Cycle Competition.

That well-known Douglas exponent, Gordon L. Fletcher, wires from San Sebastian that the cup for the best performance at the Mont Igneldo hill-climb on the 27th inst. was won on a Douglas, which also made fastest time, beating three well-known makes of motor cycles which have larger engines.

### The Safety of Three-wheeled Cyclers.

Mr. Davies's recent query as to what happens when a modern three-wheeler bursts a tyre at high speeds has excited some discussion, and has possibly occasioned a certain gratuitous prejudice against vehicles of this type, which, of course, differ profoundly in detail from the 1906 tricars. The makers of the A.C. tricars inform us that they are arranging a test on Brooklands track during Show week. The test outlined is that an A.C. tricars should be driven round the track at reasonable speed with a large carpet nail (or nails) embedded in the rear cover just so deep as not to penetrate the tube. The demonstration should be interesting, and its success would reassure users more than reams of opinion and correspondence. The bother is that it is rather difficult to arrange a real burst. If the tyre should slowly deflate instead of bursting the test will not be absolutely exhaustive, but the maintenance of a tolerable speed should render mere deflation sufficiently instructive.

SATURDAY'S A.C.U. AUTUMN TRIAL IN LAKELAND.

J. Chater Lea (8 h.p. Chater-Lea sidecar) and H. C. Munday (A.C. sociable) climbing Tow Top.

## The 8 h.p. Crouch Carette.

A New Cyclecar with a Light and Compact Engine and Gear Box Unit.

FOR some time we have been aware of tests proceeding with a new Crouch cyclecar. The four-wheeler was soon on the road after it had been resolved to produce such a machine, for practically all the parts used in the construction of the three-wheeled C.M.C. carette were utilised with the exception of the back wheel, a live axle being fitted in its stead. Last week we had a practical trial of the machine, and were favourably impressed by the comfort of the body and efficiency of the springing, the power of the engine, and the ease of management. A more reclining seat would undoubtedly be an advantage, and this small matter is receiving attention. The rack and pinion steering works very freely, and ample lock is provided. The whole machine is clean and workmanlike in appearance despite its unconventional design of radiator in front and the forward position of the seats.

The designer, Mr. W. Crouch, demonstrated the flexibility of the springs by jumping on the tail of the car, which caused a surprisingly big range of motion. The front springs are full elliptical and the rear of the grasshopper type, that is to say, they are pivoted at their forward ends and suspended in the centres, while the rear ends carry the axle. The rear live axle is driven by a short single chain. It has a spur differential, and the whole axle revolves in ball bearings, the wheels being carried on plain bearings which only come into use on rounding corners or when the differential is in action. An adjustable torque rod is fitted, which keeps the chain in alignment and at the correct tension. Both hand and foot brakes are of the internal expanding type.

The power unit is that described in *The Motor Cycle* of September 5th, page 1017. It consists of an 8 h.p. V twin-cylinder water-cooled engine of 80 x 90 mm.

bore and stroke, with cylinders set at 60°, side by side mechanically operated valves enclosed by metal covers. A Bosch magneto and gear water pump are bevel driven from the timing gear side. Bolted to the other side is the gear box and a stout aluminium member enclosing the conical Thermoid faced clutch.

This unit lies behind the seats and across the frame, and the water pump is connected to the radiator in

The new model 8 h.p. C.M.C. three-speed four-wheeler.

front by rubber pipes. The petrol and oil tanks are arranged immediately behind the engine. The gear box gives three speeds and reverse with a direct drive on top, the ratio being 4.34 to 1, 8 to 1, and 14 to 1. The front axle is of square section, and the wooden wheels are shod with 650 x 65 mm. tyres. A wood and steel fitch plate frame is used. The body is roomy and comfortable, and fitted with two side doors, which is a great convenience, as the driver does not need to disturb the passenger on taking his seat. The mud-guarding is well carried out, and a large underpan will be used to protect the mechanism, but ample ground clearance will be provided, so that the carette will be suitable for Colonial conditions.

Front and rear views of the new C.M.C. carette described on this page.

## A Single-cylinder Friction-driven Cyclecar.

The complete sociable seated Baby cyclecar.

**T**HE Baby has arrived. This attractive looking vehicle is a French production, represented in this country. It is driven by a single-cylinder 7 h.p. Buchet water-cooled engine, 90 x 110 mm., mounted transversely in a channel steel frame. The engine, which has mechanically operated inlet valves, is water-cooled on the thermo-syphon principle. The ignition is by Bosch magneto, and the carburetter is a Claudel-Hobson. The lubrication is on the splash system, and the oil is delivered by gravity through a drip feed on the dash to the crank case. The transmission is by shaft to the friction plate, while mounted on a ball-bearing feathered shaft is the leather shod friction wheel, which is arranged to give four forward speed positions and the reverse. On the transverse shaft is carried the foot brake, and from this shaft to the off side rear wheel the transmission is by chain. The brakes controlled by the side levers are on the rear wheels, and are

of the internal expanding type. The control is arranged on standard lines, while an accelerator pedal is fitted. The chassis is suspended on three-quarter elliptical springs at the rear, the front being hung on a transverse spring in a manner similar to that employed on the Sizaire-Naudin car. Radius rods are fitted. We were given a short run through London streets, and found the little vehicle to be well sprung, smooth running, and capable of rapid acceleration. The accompanying photograph shows that the Baby has a most pleasing appearance, being provided with a Prince Henry type body, which is well upholstered and comfortable, possessing a spacious locker at the rear. Hood, screen, and electric side lamps may be purchased fitted to the car at an inclusive price.

Plan view of the Baby cyclecar, showing the 7 h.p. single-cylinder engine in front, friction drive, and general arrangement of parts.

## A.C.U. Silencer Tests.

The committee appointed by the A.C.U. to go into the question of silence has decided that a 500 c.c. single-cylinder engine is satisfactorily silenced by an expansion chamber as shown in the appended drawings. The A.C.U. invites manufacturers and others to submit silencing devices, which will be tested against the "standard" silencer, the following points being taken into consideration:

- Degree of noisiness compared with "standard."
- Weight.
- Volume.

General practicability.

Brake tests will be carried out on a 500 c.c. engine, and entrants must also submit a complete motor cycle fitted with an engine of approximately 500 c.c. and with their silencer. The results of the trial will be published and certificates awarded to all entrants whose silencers are, in the opinion of the committee, worthy of commendation.

The committee selected to judge in the final tests is composed as follows: Colonel H. G. L. Holden, R.A., C.B., F.R.S. (chairman), Mr. E. M. P.

Boileau, Mr. J. W. G. Brooker, Mr. H. P. E. Harding, Dr. A. M. Low, D.Sc., Mr. W. G. McMinnies, Mr. A. Sharp, B.Sc., A.M.I.C.E., M.I.A.E., Dr. William Watson, B.Sc.,

Auto Cyclé Union Silencer Committee. It will be seen that the gases finally emerge through a  $\frac{1}{2}$  in. pipe.

### A COMPLETE REPAIR OUTFIT.

A complete repair outfit, the Vulco Junior, made by the Roberts Non-skid Co., St. Mary's Row, Birmingham, is one of the most complete outfits that can be found. It contains, besides solution, French chalk, glass paper, and canvas, a box of special valve patches, which have a prepared surface made with the patch, a piece of duplex strip patching, valve tubing, a pencil, a filecard, and a stout inside gaiter. This alone constitutes a full outfit, but such useful articles as plug washers, emery powder, and insulating tape are also included. This firm specialise in tyre repairs and converting tubes to butt enders. They have a wide range of retreads and outside gaiters. They were pioneers in the detachable steel-studded non-skid bands, and supply a form with an easily renewable tread. The Roberts belt is already well-known.

F.R.S.; secretary, Mr. T. W. Loughborough, A.M.I.A.E.

The committee points out that the standard silencer is merely a simple device to give the required standard of silence, and that it need not be copied in any way. We reproduce scale drawings of the silencer referred to by the

# CLUB NEWS

## Oxford M.C.C.

There will be a musical social at Banbury on November 5th. Members will meet at the Martyrs' Memorial at 6.30 p.m.

## Birmingham M.C.C.

Birmingham-Carlisle Open Trial.—L. Mogridge has been awarded a bronze medal for completing the double journey in twenty-five hours.

## Portsmouth and District M.C.

The first whist-drive, arranged by the committee of the Portsmouth and District Motor Club, was held on the 21st inst. at the Mikado, Southsea.

## Chester and District M.C.C.

A successful reliability trial was held on the 12th inst. over the following route: Llangollen, Valle Crucis, Ruthin, Mold, Holywell, and Chester. Results: 1, C. Dean (Triumph); 2, R. Bate (Rudge); 3, W. Price (8 Matchless). The special prize given for the best performance on Valle Crucis Hill was won by J. H. Fox (5 Matchless).

## Wimbledon M.C.C.

A speed-judging and non-stop reliability trial, over a course of twenty-six miles, starting from the Talbot Hotel, Ripley, took the place of the usual weekly run on the 20th inst. Members were started at two-minute intervals for the first round, and they were expected to complete the second round in as nearly as possible the same time as their first, speedometers and watches being barred. Result: 1, R. C. Martin (3½ h.p. Humber), two minutes early; 2, Percy Lyon (Triumph), three minutes early; 3, G. B. Barham (6 h.p. Rex and sidecar), seven minutes late.

## Luton and South Beds. M.C.C.

The results of the speed trials and inter-team trials with the Herts County A.C. (M.C. section), held on Saturday, October 19th, were as follows:

### SPEED TRIALS.

Event I.—Racing in pairs from standing start for any machine. Result:

	Time.
1. Barker (6 Zenith) ... ..	42s.
2. Dunn (3½ Rudge) ... ..	42½s.
3. Smart (3½ Rudge) ... ..	43½s.

Event II.—Passenger class for 3½ h.p. machines. Result:

1. Terry (3½ New Hudson) ... ..	55½s.
2. Child (3½ New Hudson) ... ..	56½s.
3. Sills (3½ Rudge) ... ..	56½s.

### INTER-TEAM TRIALS.

These were won by the Luton and South Beds. M.C.C., who won the lightweight and sidecar classes, and got four men placed out of six in the 3½ h.p. class.

Luton and S.B. M.C.C.      Herts County A.C. (M.C.S.)

CLASS A.	Time.	CLASS A.	Time.
Secs.		Secs.	
Simpson (2½ Singer) ... 42		Cheaney (2½ Humber) ... 42½

CLASS D.		CLASS D.	
Twigg (6 Enfield) ... 41½		Dudley (6 Zenith) ... 44½	

## Bristol M.C.C.

On Saturday, November 2nd, a special trial for amateurs will be held over a route of about fifty miles for a silver cup, presented by Messrs. Humber, Ltd. It is probable that Weston Lane, near Bath, will have to be ascended.

On November 9th the annual dinner will take place at the Queen's Hotel, Clifton. Prize winners from a distance are invited to be present as the guests of the club, and they should notify the hon. sec., Mr. P. Grout, Warmley, near Bristol.

## Essex M.C.

In the recent standard ride to King's Lynn and back, the following qualified for the club silver medal: Dr. Sempey (5 A.J.S. sc.), E. Lewis (8 J.A.P. sc.), A. V. Deacock (6 N.L.G.-J.A.P. sc.), L. G. Brown (8 Rex-Jap sc.), G. T. Gray (3½ Rudge), F. Roberts (3½ Rudge), D. S. Parsons (3½ Corah-Jap), B. W. Wild (3½ Precision), H. Moore (3½ B.S.A.), and S. Tharp (3½ Bradbury). H. C. Bouffier, on his 6 Rex sidette, had very hard luck in puncturing after having covered 185 miles out of the 200.

In the speed-judging competition just held the following awards are made subject to confirmation by the committee: Silver medals—Dr. Sempey (5 A.J.S. sc.), error 1.21s., and B. Alan Hill (3½ Corah-Jap), 1.51s.; bronze medals—S. G. James (6 Enfield-Jap sc.), F. Roberts (3½ Rudge), L. G. Brown (8 Rex-Jap sc.), D. S. Kapadia (8 Rex-Jap sc.), and Miss R. Hammett (2½ Douglas).

On Saturday, October 19th, the closing run, combined with a paperchase, was held, starting from headquarters at 4.30 p.m. The captain acted as hare in his 12 h.p. De Dion car, and gave a most sporting course up hill and down dale, right through the heart of Epping Forest, until he was finally caught by F. Roberts on a 3½ h.p. Rudge.

A paper will be read on December 5th, at 7.30 p.m., at the R.A.C. Associates' Room, Pall Mall, by Mr. Douglas Leechman, on the Motor Cycle Show at Olympia, 1912, to be followed by a discussion. All motor cyclists are heartily invited to attend.

The club dinner will be held at the Great Eastern Hotel on December 14th.

A GOOD LOAD.  
A 6 h.p. N.S.U. and sidecar, belonging to H. C. Sharp, of Eling Common, with a driver and three extra passengers.

**North Birmingham A.C.**

There will be a flexibility hill-climb on November 9th at Hints Hill.

**Doncaster and District A.C.**

A slow half-mile competition was held on the 24th inst. Result: 1, L. Baker ( $3\frac{1}{2}$  Rex); 2, C. Simpson ( $3\frac{1}{2}$  Premier); 3, W. Wagstaffe ( $3\frac{1}{2}$  Premier); 4, W. A. Bassett ( $3\frac{1}{2}$  B.S.A.).

**Stockport and District M.C.C.**

Hill-climb results:

Class 1., Lightweights.—1, W. Heaton ( $2\frac{3}{4}$  A.J.S.); 2, E. Woods ( $2\frac{1}{4}$  Levis).

Class II., Single-cylinder Machines.—1, G. Hall ( $3\frac{1}{2}$  Scale-Jap); 2, H. Thompson ( $3\frac{1}{2}$  Kynoch); 3, E. Abram ( $3\frac{1}{2}$  Matchless).

Class III., Twin-cylinder Machines.—1, F. Sirrett (7 Indian); 2, J. Woodrow (5 Woodrow).

Class IV., Sidecars and Cyclecars.—1, J. Emerson (8 Woodrow); 2, H. Greenhagh (8 Matchless) and J. Cheetham (8 Matchless); 4, E. Woods (10 G.W.K.).

F. Sirrett (7 Indian) made fastest time of the day.

Result of Reliability Trial.—1, H. Marsden ( $2\frac{3}{4}$  Douglas); 2, W. Heaton ( $2\frac{3}{4}$  A.J.S.); 3, H. Greenhagh (8 Matchless).

The chief prize was the Talbot Cup, kindly presented to the club by the owners of the Talbot Garage, Stockport, which was won by H. Marsden on the  $2\frac{3}{4}$  Douglas.

**Western District M.C. (London).**

At a recent committee meeting it was decided to hold the annual dinner and prize distribution at headquarters (Paul's restaurant). The provisional date is November 27th. A musical programme is to be arranged. The president, Mr. E. Cubett Sayers, J.P., has kindly offered to present a prize for competition next season. The runs for this month are to Burnham Beeches (refreshment house), Bagshot (King's Arms), and Wisley Hut, Surrey, which is the last run of the season.

**South Birmingham M.C.C.**

The above club held a reliability trial over a severe course on the 20th inst. The route was as follows: Hall Green, Stratford, Sunrising, Tysoe, Oxhill, Shipston, Ilmington, Chipping Campden, Saintbury, Willersey, Campden, Shipston return journey to Stratford and Red Hill. There were twenty-five entries, and all but two were started by 8.30 a.m. Sunrising, Saintbury, and Willersey Hills proved too much for several competitors, and before the finish seven competitors had retired through various failures. The results are as follows: Best performance of an amateur, J. Huntingto (T.T. Triumph), lost no marks; best performance of a trade rider, J. J. Woodgate (Singer three-speed), lost no marks.

The following competitors made non-stop runs, but were off the course on the homeward journey and were disqualified, but another competition will be held for them and the date announced later: J. Woodhouse ( $4\frac{1}{4}$  Regal sc.), L. Bees (L.M.C.), L. Poole (B.S.A.), A. Edwards (B.S.A.), F. W. Merrick (6 Enfield sc.), and C. Moss (B.S.A.).

## A.C.U. Inter-club Conference at Liverpool.

UNFORTUNATELY the above meeting, which was called to discuss the important question of the amateur, was by no means well attended. The Mersey Club, however, did its duty nobly. Its members turned up in force, and over the mantelpiece in the comfortable room in which the meeting was held in the St. George's Restaurant on Friday last; there was an artistically written card bearing words of welcome to the A.C.U. delegates. Altogether sixteen people attended who represented the A.C.U., the Mersey M.C., the Westmorland and the Oxford M.C.C.'s, the Motor Cycle Union of Ireland, and the Scottish A.C.U. Mr. J. R. Nisbet, who presided, suggested that the first point to be discussed was the grievances of the amateurs, and the second their remedy.

**The Amateurs' Grievances.**

Mr. S. W. Carty, the hon. secretary of the Mersey M.C., in opening the discussion, stated that the grievances of the amateurs could be summed up in the word "shamateur," and against this individual the former had just cause for complaint. The suggested novice class had been no new idea, and the Mersey M.C. had adopted it in a hill-climb. His own idea was to have two classes of amateurs—novice and expert—with a slight difference in entry fees between each, and two trade classes—the professional, or, in other words, the tester, who should be in a class by himself, and the agent—the small local man who found the fees demanded from the trade too heavy.

Mr. Rees, vice-president of the Mersey M.C., after heartily welcoming the A.C.U. delegates, also suggested a reduction in fees for the small agent and increased fees for the manufacturer, and went on to say that he considered that the "shamateur" question could not be solved.

Mr. Campbell McGregor, S.A.C.U., said that Scotland was in a different position, there the real trouble was with the agent, who was assisted by the manufacturer and competed on the same terms as the amateur. He suggested dividing the latter class into tyros who had never won an event, and novices who had never won a speed test or hill-climb.

On being asked by Mr. Greenhill to state the views of the A.C.U. Committee, Mr. Loughborough, secretary A.C.U., dealt with the question in a particularly clear and able manner. The two points to consider, he said, were (1) the degeneration of competitions into purely trade affairs, and (2) "shamateurism." Competitions should be divided into two classes. Those run by the A.C.U. for the improvement of the machines, and those run by clubs, which should be of a purely sporting nature. Any definition of an

amateur was unfair, and it was better to divide competitors, trade or otherwise, into expert and novice classes. The winning of, say, two first prizes, or four second prizes in any consecutive open events in which there were not less than twelve starters in the class entered, should place a rider in the expert class. Permits should be in no way restricted if the expert be barred from certain classes. The arrangement to start at the beginning of 1913.

**The Formal Resolution.**

Finally, on the proposal of Mr. S. W. Philpot, seconded by Mr. Heaton, the following resolution was passed: "This meeting is of the opinion that the scheme, as outlined by the Secretary of the A.C.U., provides a basis for a more satisfactory classification of competition riders, subject to certain modifications, particularly as regards the local agents." The Secretary was instructed to circulate the proposal among the clubs and to ask their opinion on the matter. After the meeting the A.C.U. delegates were entertained to tea by the Mersey Motor Club.

The twin-cylinder V type Crouch engine, complete with gear box, magneto, and water circulation pump.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### The Date of the T.T. Race.

Sir,—I quite agree with your correspondents' views regarding the dates of this year's T.T. races. It has come as a surprise to the majority of North-country motor cyclists, especially Tynesiders, as the race week vacation comes just at the right time, namely, June 21st. I for one will be unable to go, and I am not the only one, as I know several motorists who are sorely disappointed, and fully agree with "Week-ender," who says petition the A.C.U.

FRED H. RYLANCE.

#### An Appeal to Car Drivers.

Sir,—Referring to the letters of "Medicus" and S. Jefford expressing their views on the difficulty of persuading drivers of cars, that motor bicycle drivers (particularly when a sidecar is attached to their machine) have a right to a fair share of the road, I have found that, at the approach of a car, instead of edging to the near side of the road, if one keep on the middle until the last moment, the car driver will invariably make room.

N. H. MACLEAN.

#### Water-proofing the Machine for Winter.

Sir,—I was greatly amused at "Oilskin's" letter re waterproofing machines with vaseline. This method has brought my once happy home very near to disruption. It spoilt quite a number of my wife's dresses. It is at best very antiquated and messy.

A friend of mine at Hendon gave me a few weeks ago a sample tin of a transparent metallic lacquer which they use for protecting the metal parts of aeroplanes. It dried as hard as steel, and the bright plated parts of the machine have not been affected by the damp atmosphere of an outside cycle house. Neither mud nor oil has any appreciable effect on the surface, and the greatest advantage seems to me that it is absolutely part and parcel of the frame, invisible to the human eye. The tin was marked "Dopon," for metal and wood and canvas. Jensen and Nicholson, Ltd." Could you kindly let me know where I could obtain it, as the above firm do not advertise it? REXIFE.  
[The address of Messrs. Jensen and Nicholson, Ltd., is Goswell Works, Stratford, E.—Ed.]

#### Tyre Bursts on Three Wheelers.

Sir,—I read with interest your contributor "Ixion's" remarks on "Tyre Bursts" in the issue of the 17th inst.

I have had considerable experience of burst tyres while travelling at speed on cars and motor cycles, and some experience of the same on cyclecars, and I quite agree with your contributor that in the case of a car there is no real danger. On the other hand, a burst in either tyre of a motor cycle travelling at over 30 m.p.h. is fraught with considerable danger, unless the rider be very expert.

With regard to the three-wheeler, I have driven a Morgan runabout about 3,000 miles and have had two burst tyres—one front and one back. When the front tyre burst I was travelling at about 30 m.p.h., and the effect on the steering was the same as it would be on a car. The back tyre burst whilst practising for the cyclecar race at Brooklands, doing 55 m.p.h. The car swerved a good deal, but at no time was it in the least degree out of control. This experience agreeably surprised me, as I had looked forward with trepidation to a burst in the driving tyre, whereas now I am convinced that a three-wheeled cyclecar is infinitely safer than a motor bicycle and very little different from a car in this respect.

A. W. LAMBERT.

E2S

#### A Rust-proof Machine.

Sir,—Re "Ixion's" remarks on the all-black motor cycle, I fancy that we must have something more substantial than a brittle enamel to keep the parts absolutely safe from rust.

Some years ago, in your columns, I advocated the galvanising process, and for the life of me I cannot see why this should not be adopted. Even the nuts and bolts could be treated and made rust-proof.

I only wish that I could have my 1913 mount completely galvanised. I would not even ask for any enamel to finish the job—only for the tank.

MUDLARK.

#### Amateur Police Traps.

Sir,—Your correspondent, Mr. J. Stuart White, seems to be labouring under a grievance, although I cannot see any justification for the tone of his remarks.

The Manchester District Association of the C.T.C. is endeavouring to put a stop to reckless driving by motorists in that district, and has adopted a simple and peaceable method of doing this.

Evidently Mr. Stuart White advocates the breaking of the law, and, what is more, wants everyone to know it.

The names of those members of the C.T.C. who are going to resign *en bloc* (according to Mr. J. Stuart White) because they are not to be permitted to choose their own speed on the road, should be noted.

CECIL W. COOKE.

[The C.T.C. disclaims official knowledge of the proposed amateur traps. Our correspondent is illogical in his inferences. It does not follow that because a motor cyclist objects to persecution, official or otherwise, he is a law-breaker. We all know how inaccurate timing over short distances is apt to be, and to what injustices it has led.—Ed.]

#### Large Variable Pulleys.

Sir,—I notice in your "Questions and Replies" column last week a suggestion that a wider range of gears could be obtained with a variable pulley gear if a large counter-shaft pulley is used. Though, of course, a lower gear can be obtained by gearing down the pulley the required amount, the range of gear is not increased; on the contrary, the larger the pulley the smaller the range of gear, unless the width of the belt be increased in proportion. For example, suppose a 1in. belt is used with a pulley 5in. diameter outside. With a 28° belt the depth of the V of the pulley is twice the width of the belt, i.e., 2in., so that the diameter of the pulley can be reduced to 1in. inside the belt, i.e., about 2in. to the neutral axis of the belt (taken to be about ½in. from the lower and ½in. from the upper surfaces of the belt). The maximum diameter to the axis of the belt is then 4½in. With an 18in. belt rim this gives gears from 4 to 1 to 9 to 1. But if a 10in. pulley, geared down 2 to 1, is used, the V remains the same depth, since it depends only on the width of the belt and the angle of the V. The inside diameter of the pulley is then 6in., and the extreme diameters to the axis of the belt are 9½in. and 7in., giving gears from 3½ to 1 to 5 1-7 to 1, a much smaller range than before. Of course, these ranges are increased slightly in the case of the Rudge by the use of a variable belt rim; also difficulties of construction make it difficult to get so low a gear as 9 to 1 with the direct drive; but the point is that no increased range is obtained with a larger pulley.

P. A. LEWIS.

[Theoretically our correspondent is quite correct, but what belt will stand a 2in. pulley?—Ed.]

**The Control of Clutches.**

Sir,—The following is a brief account of a new idea in clutch controls: A B is the rod leading from the clutch pedal to the clutch itself. When the pedal is depressed B moves towards the right. This draws the plate C forward, and so compresses the helical spring D, producing a tension in the rod A. This tension tends to press the clutch plates apart. The action then is as follows: When the clutch pedal is depressed the strength of the clutch spring is weakened, and slipping begins. The amount of slip increases as the pedal is further depressed, until finally the plates are separated and a free engine obtained. The amount of slip, therefore, depends on the position of the clutch pedal. This buffer spring can, of course, be placed anywhere on the clutch extracting mechanism, and the strength of the spring can be made adjustable. When the pedal is near the end of its stroke the plate C comes up against the sleeve E.

The idea is protected, and I should be glad to hear through *The Motor Cycle* of anyone anxious to buy the patent.

G.L.M.

**A Warning.**

Sir,—Will you kindly warn fellow motor cyclists through the medium of your paper? One mile on the London side of Brentwood on the main Colchester Road there is a ten-mile limit—about 300 yards long. As I was passing through it recently, I stopped and spoke to a friend of mine, who is a member of the Brentwood Bench. He informed me that he had just come from a meeting of the Bench at which the chief constable of the county had been specially requested to do all in his power to catch motors exceeding the limit on this piece of road, as at present very little attention is paid to the signs. While I was talking to him, several cars and motor cycles came through at about 25 m.p.h. There will certainly be a very strict police trap there shortly.

A. J. USBORNE.

**Cyclecar Design.**

Sir,—I cannot see why there should be all the bickering and agitation regarding the use of the term "cyclecar." After all, the vehicles which come under this name, whether they be water-cooled or air-cooled, shaft, chain, or belt-driven, three or four-wheeled, are not designed for freak performances in competitions, but for the general comfort of those who might be expected to purchase them. Provided their cylinder capacity is of or below the specified limit, does it not rest with their several manufacturers as to whether they consider such and such a refinement conducive to the efficiency of their own particular model?

Surely, a firm which turns out a smart shaft-driven water-cooled cyclecar can be credited with knowing its own mind and also that of the public it caters for just as well as the maker of the vehicle which does not possess these refinements. It is certainly not the place of the latter manufacturer to find it necessary to cavil at the outcome of the former's experience, even though the former may market a runabout £20 or £30 dearer.

CHACUN A SON GOUT.

**The Life of Epicyclic Hubs.**

Sir,—As a practical motor engineer in the trade, and having ridden most of the best makes of motors since their inception, I am perfectly satisfied that a two-speed free engine gear with a variable pulley is sufficient for all requirements.

My present mount is a 3½ h.p. B.S.A., two-speed, free engine model, which has covered over 6,000 miles since I got it in July. When I inform you that I let it out on hire to all classes of riders, you can judge the severe usage it gets from inexperienced riders. Up to date not a single part has been replaced, and on examining the gear I find it absolutely perfect. On two occasions I have been long journeys with two passengers averaging over twelve stones each and myself fifteen stones, and taken Lord Decies Hill, Lasswade, without a falter. This is a long, severe hill, rising about one in eight.

In my opinion, three speeds will cause a lot of trouble even to experienced riders, by the undue racing of the engine, and both agents and manufacturers will suffer through the serious engine complications that will arise.

- I fitted a three-speed hub to a customer's mount only seven weeks ago, and it is already burst up and returned to the makers for repairs. The argument that the extremely low gear is necessary in traffic does not help the cause of three-speeds in the slightest, as I can travel as slowly as I wish on my two-speed. For instance, I attended Musselburgh Races, near Edinburgh, on the 4th inst., and after the last race took two sergeants through all the traffic, obliged to follow in line behind cabs, pulling up, going on, and stopping, without the slightest trouble. With the free engine position I could stand still, leaving the engine running, and by letting the clutch gradually into the low gear I could glide away as slowly as I wished.

I hold no brief for the B.S.A. Co., but my experience with their two-speed gear is that it fulfils all requirements in a really efficient manner, and is absolutely reliable in every respect.

W. HUNTER.

[Other readers, P. Gately and H. Britton, state that they have done 12,000 and 4,000 miles respectively with sidecars on similar gears.—Ed.]

Sir,—"Ixion's" invitation for experiences of two or three-speed epicyclic gears over a prolonged period prompts me to send you mine.

Although I have not used three-speed gears for any length of time, I have for several years had two-speeders in use, and one of these, fitted with the Rex adapted Roe two-speed gear, has been in constant use for the last three years, during which time it has covered a distance of over 35,000 miles. Fully 30,000 of this has been with sidecar attached, and this, in conjunction with the fact that a great proportion of it has been traffic riding, will show that the low gear has been used very considerably.

Throughout all this period the only renewals I had to make to the gear were a pair of expanding arms and pin for holding high gear in (cost 4s. 6d.) and new low gear band brake (cost 12s.) The gear was frequently dismantled, and the gear wheels and pinions were always found to be in perfect condition with practically no sign of wear. These excellent wearing qualities, combined with the ease of manipulation of the Rex-Roc gear, give it a foremost place in my opinion, particularly as later models have been strengthened in the two parts I had to renew. All parts are of ample dimensions, and well up to the work required of them—a fact which hardly applies to some of the three-speed gears on the market—and to this I attribute the satisfactory results shown.

J. A. MASTERS.

A recent convert to the motor cycle, Miss M. A. Greaves, A.L.C.M., and her sister. Miss Greaves is now able to manage her 5 h.p. Vindec sidecar with ease, even in the busy thoroughfares of Leicester.

**Transmission.**

Sir,—I have been greatly interested by "Ixion's" vigorous defence of the belt drive, and by the correspondence which has followed. All seem, however, to have forgotten one point—the great value of the adjustable pulley.

I am rather surprised at some of your correspondents' experiences, as I have ridden in all weathers in a hilly district for two years, and have never had belt slip. My machine is a Triumph, and belt a  $\frac{7}{8}$  in. Dunlop. About twice a week I apply a very little Beltecum, which is most effective.

LITTLE JIMMY.

**Tyre Wear.**

Sir,—I note the letter of R. Haddock in reply to mine on the above subject. He seems to be one of those fortunately happy ones who obtain satisfactory service out of the present type of motor cycle tyre, and is the first I have come across.

I named no firms, nor any special brand of tyres, but may say that my own experience and that of many friends embrace the most noted as well as the less known brands, and all cause grumbles, especially with sidecar.

I maintain that about five hundred miles is the average useful life of special tyres on a combination rear wheel. Having a larger section tyre, say 2 $\frac{1}{2}$  in. or 3 in., which is practically no stronger, is in my opinion no improvement, as it is, if anything, more liable to gashes, bursts, and punctures. A thicker and stronger article is required.

Your contributor, Mr. B. H. Davies, in his recent article on tyres is surely supported in his statements by thousands of sidecar users in the British Isles. He puts 1,000 miles as the general run on a 3 $\frac{1}{2}$  h.p. solo rear wheel, and, as he says, and many know to their sorrow, one gash sounds the knell of your cover. His experience of extra heavy covers, which I have always used, appears to have been rather fortunate, and I strongly agree with him and think that butt-enders should be fitted as standard on all motor cycles.

Earnestly hoping there will be some stouter tyres, more on car lines, on the market next year, for which I predict a plentiful demand,

ROADSIDE SOLUTIONER.

[There are already thick heavy tyres on the market, and some sidecar makers fit them as standard. Sidecarists and purchasers of solo machines who intend occasionally to attach a sidecar should specify thicker rear covers, for which they must pay proportionately.—Ed.]

**Combined Chain and Belt Drive.**

Sir,—There seems to be a difference of opinion between some of your correspondents on the merits of the belt drive. Mr. E. K. Wyatt certainly had bad luck on his holiday with his belt. Others say practically that they have no belt troubles at all. In view of my own experience with belts—nearly 27,000 miles—I am very much inclined to discount these latter statements. My worse case of belt troubles was also on a tour of 450 miles with a sidecar, during which distance I had to adjust the belt either by shortening or closing the front pulley, both of which are adjustments, about six times, besides which it broke twice. The belt had run under 100 miles before the tour, and broke twice more in 120 miles after the tour, when it was discarded—a total of 670 miles. My best belt record is a mileage of 6,600 miles from one belt on a solo machine, with occasional sidecar jaunts. This belt I had to shorten about once in 180 miles. Both these belts were 1 in. rubber. Other belts have lasted between 1,000 and 3,000 miles.

Other readers who have probably had similar experience of belt drive will probably also say why am I not satisfied with belt drive—it is quite satisfactory. It is satisfactory to those who have tried nothing better. Now that the combined drive has come to the fore, with belts lasting up to 8,000 miles according to "Ixion," and only 5,000 according to Dr. Patterson (both on light machines), motor cyclists think they have found the most durable drive. It is a real novelty to have a belt last for all that distance. But what of the adjustments? Certainly they are fewer per 1,000 miles, but they are just as annoying. Before a belt is finally adjusted, there is a period of slip which gradually gets worse and worse until the rider's patience can stand it no longer, and so he adjusts the belt.

The longer he can put up with a slipping belt the fewer will be his adjustments, of course. It is this state of things

that the chain does not possess. It gradually gets slacker and slacker, but it does not slip even in wet weather. The necessity for adjustment is less frequent, and takes no longer than belt adjustments as a rule.

Dr. Patterson mentions that he does not know who I am. Well, I really think it makes no difference to the superiority of the chain drive who I may be! Perhaps I might mention that my experience with chain drive started seven years ago on a 2 $\frac{1}{2}$  h.p. Humber, P. and M. gear, which I rode 17,000 miles on one set of unprotected chains. In this distance I had one road stop due to chains. This was on a very wet day, and the mud ran from the mudguard right on to the back chain, causing very rapid stretching, and finally the chain came off the back wheel. In ten minutes' time I had readjusted the chain and altered the mudguard and was on my way.

About every 1,200 miles I used to adjust the chains. I had a Scott and had no trouble with the chains. I now ride a 6 h.p. Enfield with sidecar. To date I have ridden this 2,200 miles without chain trouble and only one chain adjustment at 1,600 miles. During the recent very wet weather I rode 1,062 miles in eight days of the wettest, and the chains never grumbled in the least.

I think Dr. Patterson is rather afraid of chains if he discards his chain after 5,000 miles just because they have stretched a little. They should run three times that distance on a Douglas without any trouble. The question of the slipping clutch I hope to be allowed to touch on in another letter.

THOMAS F. MAW.

**SUMMARY OF CORRESPONDENCE.**

Traveller writes: "A cyclecar weighing 4 cwt. with 5 h.p. twin engine, foot-operated clutch, two speeds, chain to counter-shaft, and two one inch belts from counter-shaft to driving wheels, can surely be sold for about £60. When will manufacturers ignore the speedman and cater for the thousands who want a machine like the above?"

"Godalming Motor Cyclist" referring to our reply to "E.M.N." advising a route through Munstead Heath and Peasmarsh to avoid Godalming says: "It is only motorists who exceed speeds between 14 $\frac{1}{2}$  and 18 m.p.h. who are summoned in connection with the Godalming speed limits."

IN PRAISE OF A LIGHTWEIGHT.

A well known surveyor and estate agent Mr. Robert R. Procktor, of Catford, on his Motosacoche; his machine is a 1909 model which has been in constant use since delivery and no trouble has been experienced with it otherwise than ordinary wear and tear. The nature of the rider's profession very often takes him far afield—and it is then that the motor cycle is invaluable. Frequent long journeys are undertaken to make surveys. In one week the machine compassed five non-stop runs to Southend-on-Sea.

# Martin

## THE STANDARD OF EFFICIENCY.

The name "Martin" implies the standard of efficiency in motor cycle construction. This is realised by both trade and public alike, and it is the persistent aim of manufacturers to reach this standard.

Every rider should see that his machine possesses this degree of efficiency, but to be quite on the safe side follow our advice—

**BUY A MARTIN IN THE FIRST PLACE.**

All Martin machines are tested and tuned up under the direct supervision of Mr. Harry Martin before delivery.

Agents wanted for Territory not represented. Early application is essential.

Write for full particulars to—

**CARS & MOTOR SUNDRIES, LTD.,**  
175-177, Shaftesbury Avenue, LONDON, W.C.

# Question & Replie

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

## Aldershot to Holyhead.

Please give me your advice as to the best route to follow from Aldershot to Holyhead, so as to avoid large towns and bad hills, travelling on a  $3\frac{1}{2}$  h.p. New Hudson and sidecar; no passenger in sidecar, but carrying small amount of luggage.—R.W.V.K.

Your best route would be as follows: Aldershot, Odiham, Hook, Bath Road, Streatley, Wallingford, Oxford, Woodstock, Shipston-on-Stour, Stratford-on-Avon, Alcester, Headless Cross, Broms-grove, Kidderminster, Bridgnorth, Shrewsbury, Llangollen, Corwen, Pentre-Voelas, Bettws-y-Coed, Bangor, to Holyhead.

## Petrol Consumption.

I would like to ask a question relating to consumption of petrol in a 1912  $3\frac{1}{2}$  h.p. Precision engine and B. and B. carburetter. I get at present 70 m.p.g. with sidecar, and liquid petrol jumps out of the handle-bar controlled air inlet. If I fit a tube about 4in. long to this inlet, will I benefit therefrom in power and consumption?—G.W.T.

Perhaps the level of your petrol is a little too high in your jet. This would account for the high consumption and blowing back of petrol. Another cause may be too weak an inlet valve spring. If you fit a long tube to the inlet pipe you may get slightly increased efficiency.

## Choked Jet.

Quite recently I purchased a new 1912 Scott. I believe something is wrong with the carburetter, and would like to lay before you the following facts, and trust you will be good enough to answer them: The engine runs at speed perfectly, but with the throttle not more than one-third open, and the air lever in every conceivable position, I feel continual snatches on the chains, which, I conclude, are due to misfires. The action of closing the throttle lever has the effect of violently accelerating the machine for some twenty yards, unless the air lever is far advanced.—NOVICE.

We should say that the trouble is probably due to a partial obstruction in the carburetter jet. When using the Scott on which we followed the Six Days' Trials last year, the same symptoms occurred, and it was found that the jet was partially obstructed by grit, and when cleaned out the engine ran perfectly. You might inspect the transfer gauzes.

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects

## Exhaust Whistle.

I should be obliged if you would inform me (1) if an exhaust whistle harms the engine in any way, carbonises it, or causes any loss of power. My machine is a  $3\frac{1}{2}$  h.p. model. (2.) If a piece of wire or a chain stretched across the tyre to catch thorns, etc., is bad for the tyre, or wears it out before its time.—D.S.

An exhaust whistle will not harm the engine in any way. Of course, it sets up a little back pressure when the whistle is actually being blown, and carbon eventually forms inside the whistle, but it will not carbonise the engine. No, a piece of wire just clearing the cover to catch the thorns, etc., is quite good.

## Reliability Trials.

As a constant reader of your valuable paper and a club member, I would thank you if you would kindly give me your opinion on the following reliability trial held recently. Entries are accepted from thirty-three club members. Twenty-four competitors start on a reliability trial from headquarters at 2 p.m. (one minute intervals), the last competitor leaving at 2.32 p.m., to a point fifty-two miles away and back. A control of one and a half hours is made at the aforesaid point, all competitors leaving to schedule time. On the way fog is encountered; two or three competitors meet with accidents. The first man checked in at headquarters fourteen minutes late, some eight or nine others completing the course within the hour late. Do you think the committee would be acting up to general club principles to declare the competition void on account of the fog? Further, if a secret checker wait the time appointed after the last man is due at his check, and having checked some eight or nine competitors, should the check stand in defining the winners? Also what is the general custom in penalising a competitor who passes through after the check has ceased working?—C.B.

We should say that, under the circumstances, it would be right to render the competition void on account of the fog. If the checker wait until the maximum time has expired for the last man, the check should naturally stand. Anybody arriving after time, of course, cannot qualify for an award. In the case of fogs, floods, etc., either special allowances must be made or the competition should be rendered void. A competitor who passes through after the check has ceased working usually loses the maximum number of marks for that section.

A BROOKLANDS BEDELIA.

Mr. Robt. Bourbeau on the racing Bedelia with disc wheels, with which he finished second in the last cyclecar race at Brooklands. Mr L. N. Palmer, the British agent for Bedelias, is standing beside the vehicle.

## Starting a Sidecar.

My 1912 T.T. roadster Triumph Montgomery sidecar I am able to start with passenger seated on the level and jump into saddle, and now I am thinking of ordering a 1913 Rex-Jap 6 h.p. standard twin. Do you think I shall be able to start this with Canoelet sidecar in the same manner, or will the weight be too heavy? I do not want to go to the expense of a free-engine and two speeds. Do you consider that the machine will give me satisfaction and climb hills of 1 in 5 with sidecar and passenger, geared 4½ to 1, my weight thirteen stones?—V.B.

No, you will not be able to start this machine on any gradient with a passenger and sidecar, and we should advise you to invest in a similar model with change-speed gear. The machine should be satisfactory, but it would hardly climb 1 in 5 singly geared.

## 3½ h.p. Sidecar in India.

My machine is a 3½ h.p. 1912 Triumph with free engine. I intend to take it out next month to a part of India where the country, for hundreds of miles round, is dead flat. The roads are good, there is no speed limit, and no traffic riding. (1.) Can you please tell me if you think that the use of a sidecar, with passenger up to twelve stones, would strain the engine, etc.? (2.) Supposing that you consider the engine would suffer from this, what parts exactly would be affected? (3.) Would the life of the engine be appreciably shorter than if the machine were used only without sidecar?—S.D.V.

(1.) The machine would take a sidecar satisfactorily under such conditions. (2.) If the machine is driven carefully, it should not damage it in the slightest degree, but you must be careful not to over drive it. Possibly the hot climate in which you reside, combined with use of sidecar, will increase the risk of overheating, and the combination would shorten the life of the engine.

## Weight of Piston.

Not long ago I broke my piston. I ride a 3½ h.p. 1910 Triumph. A local firm here (India) cast me another, and as far as I can see it works very well indeed. I have, however, managed to secure a Triumph piston, and find that the one made for me by the local firm is slightly heavier than the Triumph. Is there any harm in this? Of course a light piston means more speed. Is there any harm in using the heavier piston besides a small diminution in speed? I did a run of ninety-five miles recently with the heavier piston and never had any trouble, the engine being surprisingly cool at the end of the journey. I should deem it a favour if you would kindly give me your advice on this point.—R.P.

Yes, we should advise you to use the Triumph piston, as this is lighter, and the lighter piston gives greater speed. We do not know that there is any actual harm in the heavier piston, beyond the fact that it must upset the balance slightly, and thus strain the bearings.

1913 model twin-cylinder Clyde-Jap with kick starter and N.S.U. two-speed gear.

## Bad Knock in New Engine.

I have a new 2½ h.p. machine on which I have covered about 350 miles. From about 10 to 20 m.p.h. there is a clanking noise in the engine, giving a metallic ring. If the pulley is rocked sharply to and fro I can feel a knock; in fact, it can be felt by holding almost any part of the machine as well as being audible. It occurs in all positions of the piston, and is unaffected by the positions of the cams. It is more pronounced with the compression cock shut. The engine is the product of a well-known firm, and, on consulting them, they say that it is a cylinder knock caused by the piston rocking about the gudgeon pin. They say that they make their pistons a slack fit and rely on the rings entirely for compression. The clearance between piston and cylinder must be of generous proportions to give such a knock, and I should think conducive to rapid wear. Is it bad workmanship?—W.B.S.

We should say that the cause of the knock is either bad design or some mechanical defect. The engine should be taken down and put right by the firm, so that there is no knock noticeable.

## Runs Badly on Top Speed.

Under the proposed new rate of taxation: (1.) Would a 3½ Triumph be liable to an increased tax? Will a sidecar be taxed no matter what the power of engine may be? (2.) My 3½ will fire freely on 8 to 1 gear, but seems to have not much power on 4½ to 1, and will often choke and stop on the slightest gradient. I have cleaned out everything and had magneto thoroughly overhauled by maker. My tank has had a bruise near oil partition. Would oil getting through cause this bad running on top gear? Sometimes engine runs well on top gear, but always runs well on low gear.—H.M.

(1.) The proposed tax will not affect single-cylinders up to 89 mm. bore with or without sidecar. (2.) Oil leaking into petrol tank would very likely cause the trouble you mention, if it occurred on both speeds. It would alter the float

chamber level, decrease the efficiency of the mixture, and possibly soot the plug temporarily. We should, however, advise you to check petrol level and look to the compression.

## EXPERIENCES WANTED.

"C.E.H." (London).—Binks two-jet or any other carburettor which improves hill-climbing of 1912 four-cylinder two-speed F.N.

"W.J.D." (Dumfries).—Two-speed and free engine Bradbury and James motor cycles, solo and sidecar, as to reliability, hill-climbing, and petrol consumption.

"J.J.B." (Bayswater).—2½ h.p. Levis touring model, especially as regards cooling and petrol consumption.

"P.J.D." (Ilford).—Kerry-Abingdon two-speed gear control.

"P.C." (Norwich).—Levis motor cycles, particularly lady's model.

"A.L." (Bradford).—Twin Zenith and sidecar. Belt wear in hilly country, speed and petrol consumption.

"W.M.M." (Carlisle).—Brampton variable gear.

"J.C.E." (Newton-le-Willows).—Turner's sidecar, comfort and power for haulage. 8 h.p. water-cooled Williamson, and 3½ h.p. water-cooled Green-Precision.

"A.W.G.M." (Amersham).—6 h.p. 1912 Speed King Rex, hill-climbing, speed, and reliability.

"A. Barnes." (Wellingborough).—1910 Standard Triumph fitted with Mabon variable, Bowden two-speed, or any other change-speed gear for sidecar.

"L.H.C." (Streatham).—1912 model K Douglas, particularly as regards slow running.

## "The Motor Cycle" Photographs.

Duplicates of photographs appearing in "THE MOTOR CYCLE" will be supplied at the following rates:—Unmounted prints, half plate, 1/6 post free; mounted, 1/9 post free. This refers only to photographs taken by "THE MOTOR CYCLE."

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

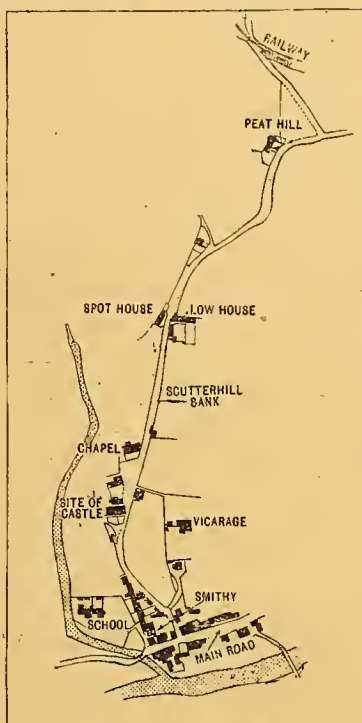

## Three Precipitous Northern Test Hills.

By B. H. DAVIES.

EVERY year when I ride north for the Scottish Trials some sporting friends of mine in County Durham are prepared with two or three "unclimbable" hills. They have yet to find one I cannot get up, but this year they unearthed two magnificent test climbs, worse than anything on the Scottish 1,000 miles so far as gradient goes, and I failed four times on one of them before getting up, and at the fifth time of asking I had to trail my feet to keep upright. Messrs. Rutter Bros. at the smithy in Langley Park, five miles out of Durham on the Lanchester Road, will direct any interested riders to the hills, if the directions given below are insufficient.

### Holmside Hill.

Holmside Hill is distinctly the more severe of the two. I made the first solo ascent of it at the fifth attempt, and I believe it has yet to be climbed by a sidecar. It is reached by going to Witton Gilbert (five miles out of Durham on the Lanchester Road), and at the west end of the village take the road to Acron Close; at the first fork avoid the road through a gate, which goes to Burnhope, and proceed straight on down Holmside Hill. The hill is a mile long, and very rough, but the upper stretches are negligible. The gradient and the surface and the fierce corners are at the bottom. I will not attempt to estimate the gradient, for the real difficulty consists rather in sur-

How to reach Peat Hill.

face and corners. I was riding a Triumph (three-speed Armstrong), and for the first 200 yards the machine and myself were oftener in the air than on the ground. I failed once owing to belt slip, and three times owing to my thigh knocking the gear lever out of its notch. The fifth time I bounced up somehow. So far as I know, no motor of any sort has ever got up before; a car once came down, and nearly demolished the house at the bottom.

### Peat Hill, Westgate-in-Weardale.

Peat Hill turns at right angles out of the village of Westgate, twenty-seven miles from Durham on the Durham-Alston road, and is an ideal test hill, having excellent surface, and no bad bends until most of the gradient is surmounted. I never venture to make precise statements about the grade of unsurveyed climbs, but local riders are confident that it contains 200 yards of 1 in 3 and a fraction; while I think this is a slight exaggeration, I admit it is a perfect gradient test. The natives say one Triumph had gone up prior to our visit. I climbed it at the first

attempt with my Armstrong Triumph, but my three companions, riding two-speeded P. and M. machines

(1) J. W. Rutter, with passenger, on the second corner of Peat Hill, Westgate. (2) The steepest portion of the hill, gradient 1 in 3.

#### VIEWS OF HOLMSIDE HILL—A DURHAM COUNTY ACCLIVITY.

- (1) Showing top bend, gradient 1 in 3½. Note the surface of hill. (2) Bird's-eye view of hill showing the bends. (3) J. W. Rutter coming down hill without brakes. (4) Rutter stops on the top corner.

CONTOUR SECTION OF PEAT HILL.

and a two-speed N.S.U., all stuck low down. Since my visit Mr. J. W. Rutter has made the first sidecar ascent with a two-speeded 1912 Clyno, carrying 24 st. He was successful at the third attempt, after inserting larger jets in his Binks carburetter. The photographs do not convey a correct idea of the steepness of this hill.

#### Softley Bank for Corner Practice.

Riders desiring some hairpin practice should enquire in Stanhope for a very pretty little hill named Softley Bank, close to the village (five miles nearer Durham on this same road), which includes five Amulree corners in half a mile, plenty of single figure gradient, and a decent surface, composed of small stones which entail no bouncing, but induce an inclination to dry skids at the bends. Any machine which can make sure of these three climbs is in good order.

# MOTO-REVE

2 - 2½ - 3 and 4 h.p.

Dear Sirs,

You will no doubt be interested to hear what your machine will do. Riding one of your 2 h.p. 27 guinea models, I came from Offord, Hunts., to Scarborough, 186 miles, at an average of 18 miles per hour, including stops for petrol. Considering that I weigh 11 stone, this, I consider, is a remarkable performance for such a small machine, and one which only weighs 80 lbs. Congratulating you on this remarkable little engine,

Yours truly,

L. M. J.

## National Road Guards.

IT must not be supposed that we are entirely hostile to the control of motorists by Liverpool amateur police, or that we are out of sympathy with all the users of the king's highway except motorists; for such is not the case. In fact, if the National Road Guards simply proposed to put down the road hog, who, though a *rara avis* compared with the number of motorists on the roads, undoubtedly does exist, and is, we fear, fairly common in certain districts, they would have our entire support.

No reasonable man can object to cases of dangerous driving being reported to the police and action taken to put a stop to this reprehensible practice. We notice that such steps are being taken by the Birmingham police, and we are glad of it: for these practices are not only objectionable in themselves, but they bring discredit upon the whole body of motorists, and are often the cause of complaints, unnecessary restrictions, and police activity. Then the innocent are likely to suffer with the guilty.

What we do object to, however, is the very evident animus and ill-feeling displayed by the instigator and his followers, who have threatened to take action against all motorists who exceed a bare 20 m.p.h., as timed by inexperienced timers, and possibly with watches that cannot be relied upon. There is already too much of this sort of thing done by the police, who, instead of regulating the traffic, horse as well as motor, in towns and villages, at dangerous corners and cross roads, and in other places where special care is necessary, lie in wait in the very places where a fast speed is perfectly safe and exceeding the legal limit then becomes simply a technical offence, and this with the object of extorting money to relieve the local rates, as is proved by the ferocity of the fines, which in some counties—Surrey, Sussex, Lancashire, and lately Huntingdonshire—are out of all proportion to the offence. In fact, the sport of wife-beating and assaults on the police can be indulged in more cheaply than riding a motor bicycle if the rider has chanced to leave his licence in the pocket of another coat.

If the National Road Guards will confine their attention to putting down the road hog and stopping really dangerous driving we should be only too glad to give them our support. It is not, however, fair to blame all motorists for the faults of a few. What is wanted is a little more consideration all round and a stricter observance of the rules of the road.

## Silencers.

THE interesting and instructive article on silencers recently published comes at an opportune time when the Local Government Board is about to issue fresh regulations regarding the use of cut-outs on motor cycle engines. It will be noted that our able contributor confirms the statements made on several occasions in this journal, viz., that to secure reasonable silence it is necessary to have a fairly large expansion chamber, and that without a certain cubical capacity in a given length of piping in which to allow for expansion and to permit cooling to take place quietness of running cannot be expected. Motor cycle engines have for long enough suffered from a lack of adequate means of quietening the explosions, and manufacturers have not cared to spoil the graceful outline of what is recognised as the *beau idéal* of motor cycle design by fitting what must inevitably be a somewhat cumbersome box. On May 30th, 1904, an excellent article contributed to this journal by a Continental writer, Dr. Wood McMurtry, showed that he had spent a considerable amount of his leisure in experimental work in connection with the silencing of the exhaust of motor cycle engines. Various trials were made with exhaust boxes of small dimensions, but they were all finally abandoned in favour of long pipes leading from an expansion chamber. This writer recommended two or more pipes to be led from the expansion pot towards the rear of the machine. The total area of these pipes in the case of his experimental models equalled the area of the exhaust port, and they were wound in one case round and round the chain stays of the bicycle frame. The flattening of the pipe ends was not suggested, but the writer proved that it was possible to silence an engine to such a degree by the above method that the noise of the expanding exhaust gases was scarcely audible.

We shall welcome the regulation of the Local Government Board if it really render a motor cycle more silent, by the prohibition of a cut-out, because by the abuse of it a certain class of motor cyclist has made himself an intolerable nuisance. The L.G.B., however, should not overlook the fact that there is no real necessity to legislate in the direction of the cut-out, because it has already a remedy in its own hands. The law says that no motor cyclist or any driver of a motor vehicle shall cause an undue noise which can be construed as a nuisance to others.

# OCCASIONAL COMMENTS

by "IXION"

## Hosing Down.

I believe that, within a year or two, it will have become the custom for the ostler of any hotel we stop at to touch his cap with the query, "Hose your machine down, sir?" The novel attention paid to weather-proofing seems to point in that direction.

Really, there is not a great deal to be done to render this millennium possible. Some plating has still to be eliminated from the lower portion of the machine; many controls are far from waterproof (*e.g.*, the handle-bar control of magnetos, the small frame spindles incorporated in steel rod control gears, etc.); many frame bearings still admit water; many carburettors would soon rust their slides under the hose; and so forth. In the old days we had to clean the largest cars down by hand, and the coachwork was the only part adapted to hosing. Such a state of affairs would be intolerable to-day, and the motor cycling public will not long tolerate the abominable dilemma of having to ride a filthy mount, or of going carefully over each detail with a hand rag, a bristle brush, and paraffin.

## Cyclecars and Small Cars.

It is abundantly obvious that the "cyclecar" designers are sure that they have got hold of a surviving proposition in the light three or four wheeler, and the high prices listed by some of the innovators, which exceed the list prices of many a small car proper, show that the cyclecar is thought to possess marked advantages over the genuine small car. The future of the cyclecar will depend upon the reality of these alleged advantages. The cyclecar's most obvious scoop consists of its higher speed and greater hill-climbing capacity, but these may probably be balanced by its inferior comfort. The greater weight and the more luxurious upholstery of the genuine car afford a degree of comfort which will not easily be obtained on the lighter chassis with its high speed engine and faster road travel. Hence, it is probable that the survival of the cyclecar depends on low upkeep charges.

Taxicab experience shows that a small car proper cannot be run for less than 4½d. a mile, even when the economies of cheap petrol, skilled attention, and giant organisation are available. The practical question of 1913 may therefore be as follows: *Can a single-handed amateur run a cyclecar for 2d., 3d., or 4d. per mile?* The final answer should certainly be affirmative. Some of the comparatively experimental chassis may be far more expensive for a year or two, but when the new designs have had time to settle down, cyclecar upkeep should be distinctly economical.

A light well-made chassis should cost little for mechanical attention and replacements. In all motor-ing upkeeps tyres are easily the heaviest item, and the cyclecar in its simpler forms should have a lower tyre bill than a heavy motor bicycle and sidecar. A pair of good back tyres can accomplish extraordinary mile-ages on the rear wheels of a light quadricycle, if the

clutch and brakes are sensibly handled, and if the rider be content to accelerate slowly. Banging the clutch in on full throttle to effect sensational dashaways is what peels off rubber treads.

## Cheap Covers.

Some controversy has been excited by a diatribe on the alleged short life of the 35s. type of cover. Personally I should estimate there is a considerable variation in the quality of different samples. Several years have elapsed since I managed to secure a mileage of over 1,000 from one of these covers; but I perfectly recall obtaining nearly 4,000 miles from a cheap ribbed Clincher in the year 1906, and during the interim I have come across samples which have performed almost equally well. Only last week a rider showed me a 35s. cover on his back wheel, which had done 2,800 miles; true, the lozenges had completely disappeared, and the tread had become a mere "plain round"; but it was free from cuts and cracks, and still carried plenty of rubber along the business contour.

If it had been mine, I should have got a fresh studded tread vulcanised to it, and transferred it to the front wheel, on which I should expect a further 2,000 miles or so.

The last two or three 1,000 mile trials have provided numerous cases in which a single rider has used up two, three, four, and even five of these covers within a week, owing to hard riding over bad roads. It is probably advisable to fit a stronger cover on any back wheel which is not readily removable.

In the 1912 Taunton Trials very few of the best riders trusted to standard 2¼in. covers on their back wheels; and it is possible that a few leading makers will standardise the medium heavy covers for 1913.

An American runabout propelled by a twin-cylinder V type engine rated at 8½ h.p. The drive is by chain throughout, first through a counter-shaft and again to each rear wheel. The wheelbase is 72in., and the track 42in., and the total weight is 550 lbs. The makers, the C. V. Stahl Motor Co. of Philadelphia, now have in hand a four-cylinder engine to fit this cyclecar.

## THREE ON A CYCLECAR. THROUGH DARKNESS AND RAIN ON A G.W.K.

It was raining, literally pouring, when we set out from Kendal for Coventry on a G.W.K. at the beginning of last week. The vehicle was the one on which R. G. Mundy accomplished a non-stop run in the autumn trial; it had been driven down from London by road, and up to that point the run had been without incident. It was arranged that we should drive it to the Midlands, and our arrival necessitated a shuffling of positions, H. P. Beasley, the assistant secretary of the A.C.U., being perched on the engine cover.

Three on a cyclecar is perhaps expecting too much, specially as a heavy portmanteau was carried in addition, but from our viewpoint the test was more complete. The 180 miles trip was not exactly a run of unending pleasure, but that was due to no fault of the gallant little G.W.K., which answered all requirements and gave no trouble. The car had been hurriedly prepared, and no food and screen were provided, so we may be excused for raiding a motor agent's shop on a Sunday and bedecking ourselves in oilskins and sou'-westers. We finally got away from Kendal at 11.15 a.m., and were soon cutting out the pace for Lancaster and Preston, the sporting little machine being as nimbly as a 20 h.p. five-seater car of which we have lately had experience.

### The Handling of the Machine

One needs no special tuition in the handling of a G.W.K.; there are no levers on the steering wheel, an accelerator pedal being the only form of control. Depressing the pedal, which is the usual clutch pedal, disengages the friction wheel from the central disc, further pressure bringing the brake into action. The worm and sector steering is delightfully easy, without play, and yet not too sensitive. Gear changing is easy after getting accustomed to the friction drive. The clutch pedal is depressed and the gear lever put into the position desired as usual, but the pedal must then be released before touching the accelerator. To race the engine before releasing the clutch pedal would in time have the effect of grinding "flat" on the friction wheel.

Though a friction gear provides an infinitely variable ratio between the low and the high limits, five notches are formed on the quadrant as an indication to the driver. With a long journey before us, and owing to the late start, we hurried along at a fine bat, the engine seldom calling for a lower ratio than the top (4 to 1), though for that matter a 5 to 1 would increase the speed on gradual ascents. The engine is effectively silenced, and the friction drive emits but a slight hum. Beasley, who at first hung on to his insecure seat anxiously, was not long in discovering that he had the firmest seat of the party, the engine being directly under him. The wind was dead against us and blowing

with tremendous fury. After about twenty miles we watched for the water to boil, but the pump was doing its work too well.

Nearing Lancaster, the look-out man observed the Hutchinson tyre 20 h.p. Belsize on our heels, which, of course, meant extra throttle opening, but the bigger car was three or four miles an hour faster on the level, yet we covered nearly five miles before the party was out of sight. We stopped for a moment or two to offer assistance to a stranded cyclecar driver outside Lancaster, and then began to make up lost time.

### More Rain on the Lancashire Cobbles.

At Preston our average was 25 m.p.h., despite the strong wind, but then we struck the cobbles and tramlines, the memories of which are always associated with Lancashire in any casual reference to the district. To make matters worse, the clouds broke and the

rain poured down with doubled fury. It was well-nigh impossible to see, and our pace was reduced to 18 m.p.h., and soon we were sitting in a pool of water. For nearly ten miles these discomforting conditions prevailed, and we elected to stop at Wigan for a snack. The rain ceased here, and after half an hour's delay we pushed on again as fast as the stone setts would allow. We must be forgiven for feeling thankful that we were mounted on four wheels, two would have been a nightmare on such a network of greasy tramlines, a sidecar an improvement, though a

rather exposed position for the driver, but we were snug on the four-wheeler and protected from the elements. Nearing Warrington the good engine commenced to dot and carry one—no petrol left. By strategy in running with the off side wheels low in the gutter, we scraped along another two miles, but the engine finally gave up in sight of Warrington—not a drop of the precious spirit left. A passing cyclist took a message to a sporting cycle agent, who at once jumped on his bicycle and pedalled his hardest. We crossed the Manchester Ship Canal by the swing bridge, and struck out for Knutsford.

### The Conditions Improved.

We revelled in the Cheshire roads, not that the little G.W.K. was uncomfortable on any surface, and we were able to show much bigger cars how to shoot up hills. Through Holmes Chapel and Newcastle-under-Lyme the going was without incident—it had stopped raining for a time—and we finally reached Stone, Staffs., just before dark, our average throughout being just 20 m.p.h. After dinner at the Crown Hotel we set out into the inky darkness with two miserable little oil lamps to light our path. Luckily we knew the road, which added 5 m.p.h. to our speed, and caused Mundy and Beasley several times

The G.W.K. on which three passengers travelled 180 miles in a day at legal limit speed.

## AUTUMN.

*"Leaf after leaf, day after day  
Were massed into the common clay."—SHELLEY.*

## There is a Cyclecar.

to press imaginary clutch and brake pedal, as at turnings a black wall suddenly loomed ahead. We had not done with the rain yet: it pelted down and cut our faces like sharp stones. Lichfield looked dismal enough, but outside the city the conditions were miserable to a degree. Large pools of surface water reflected our weak lights, and somehow we managed to take the left turn for Tamworth instead of right to Coleshill.

So much rain had fallen that water stretched across the road, and more than once we tashed through it unawares at legal limit and sent a big wave over the dashboard. The incessant wet had but one effect on the vehicle, and that was to render the gear-changing mechanism stiff. This was especially noticeable on the ascent through the main street of Coleshill. The

road between this place and Stonebridge should be avoided if it means twenty miles added to one's route. It is terrible, and there is no such thing as dodging the pot-holes, even in daylight. Another watersplash taken all out in the dark was the last recollection of this moist run.

It will be observed that no reference has been made to skidding, simply because there was no suspicion of such a thing. The low build combined with the Stelastic tyres, which had only just begun to show the steel coils through the tread, contributed to the stability of the car.

We like the G.W.K. very much. The twin engine only makes its presence felt at slow speeds, there is ample leg room, a comfortable reclining position, and if only the brakes were more powerful it is difficult to imagine a more sporting little four-wheeler.

## Cyclecars.

## A DISSERTATION ON DESIGN.

A CORRESPONDENT signing himself "A.M.I.C.E." has written a letter on "Cyclecar Design" to our contemporary, *Internal Combustion Engineering*. The letter is obviously written by one who understands the design and construction of motor vehicles, and we think it of such a practical nature that we reproduce it for the benefit of our readers. We do not agree with all the opinions of "A.M.I.C.E.," but many of his arguments are very sound.

Sir,—I see that many designers of cyclecars are falling into some fundamental errors.

Assuming that the machine is to be a comfortable all-weather vehicle for ladies and luggage as well as for men, rather than a "sporting affair," may I suggest the following points as correct in principle.

Without correct principles failure in the end is assured.

Following the reference above to a "sporting affair" there are such different ideas as to "sport."

In the case of the most "sporting" machines of all, it is 10 times essential for them to be pushed up greasy hills in the midst of trams and lorries. I have seen this with a cyclecar which had no reverse.

My remarks will appeal mostly to those who refuse to do this sort of thing at any price. They will not appeal to the man who must cut the first cost down to the minimum and be prepared for some discomfort. He will put up with the "sporting affair."

## Points Considered Desirable.

1. Seats abreast, not tandem. (The unsociability of the car helped its doom materially.)

2. A differential and four wheels. (The differential gear would give as little trouble as any part of the machine.)

The tri-car form of three-wheeler is unsuitable owing to tyre wear and instability; the weight is wanted on the driving wheel and also low down and well inside the wheel-base; these three things are not obtained, as a rule, with the tri-car form, especially with the seats abreast. There is also no difficulty of steering if the back tyre bursts at speed.

Of three-wheelers there remains the tricycle form. This is not so bad, but you have a differential and three tracks, and it is better all round to add another front wheel and make it a cyclecar. As regards the separate drive by one belt to each wheel instead of a differential, in this the belts are asked to slip for going round corners, and to grip for driving, and to do both at once going uphill round corners, and such agreeable belts have not yet been made. If they do not slip going round corners, the back tyre will be wearing. A differential gear should be less trouble all the time and cheaper in the end.

There is a form of differential action combined with V belt

drive and infinitely variable gear, which should be cheap to make, but is not yet on the market.

Each back wheel is driven by a belt running over a pair of variable pulleys, one of which closes by centrifugal force when the speed rises, thus raising the gear, and *vice versa*; at the same time the other pulley opens against a spring owing to the pull on the belt increasing and *vice versa*.

By using a suitable chain or other gear reduction, the pulleys can all be kept large enough to suit a belt and small enough to put in a case. The life of a V belt running over large pulleys and protected in a case should be quite different from that to which we have been accustomed.

3. Seat midway between the wheels, for comfort, and very low.

4. Engine and gears behind seat, to get weight on driving wheels, and plenty of room for legs in front. About 8 to 10 h.p., three speeds and reverse.

The position of the engine behind the seat makes water-cooling advisable, and there is room between the two seats for the control rods or wires and for the pipes to come up to the radiator in front.

5. Wheels and tyres as large as possible within limits. The extra cost is soon saved in money, not to count the comfort.

6. Body. Weight and money can be economised here.

It might run to a carefully designed wind screen, but a hood, though very useful when standing still, is a terrible h.p. absorber on the move if put up. There is plenty of room for luggage over the engine.

7. Appearance. I especially suggest that too much attention should not be paid to convention in appearance.

"Looks" are a matter of opinion and of usage. Nothing "looked" more ridiculous than the pneumatic tyre when it first came in.

## Luxury Not Essential.

I should also point out that in many fundamentals there need be no difference in aim between the designs of the open two-seater car and the cyclecar. This may appear quite a heresy, but it will bear looking into. Other things being equal, no one wants an open two-seater car to be dear or heavy, and no one wants a cyclecar to be uncomfortable or unable to carry luggage, which it will be so long as the seats are placed over the back wheel or tandem.

People only want a vehicle which can be relied upon to take them and their luggage over comparatively bad roads in a cheap, comfortable, and speedy manner.

They buy the small car because there is nothing else at present to do what they want. The cyclecar is speedy and cheap now. Make it, by suitable design, a comfortable, reliable luggage-carrying vehicle, and it will fill the small car's place without the latter's high price.

I make a difference between comfort and luxury. The luxury found on large cars nowadays is not for the open car at all.

A.M.I.C.E.

## An Open Letter to the Motor Cycle Trade.

By B. H. DAVIES.

**G**ENTLEMEN.—In the name of thousands of grateful riders we have to thank you for the courteous efficiency with which you have provided for our pleasures during the year 1912. The memory of the motor cycling community is stored with a blurred panorama covering millions of miles of road, ridden with an unparalleled minimum of compulsory stoppages, disfigured by exceptionally few heavy repair bills, and marred only by what Mr. Mantalini felicitously described as "demnition dampness," for which you were not in the least responsible. You have added to the gaiety of nations, and you have done even more for the public health than either Mr. Lloyd George or the British Medical Association. We trust that in return you have reaped reasonable dividends, and that the whole of your staff, from the principal scrip-holder down to the newest office boy, will share in the prosperity of your business.

### Spring Frames.

And now we are turning to you in sanguine anticipation of the 1913 season, trusting you will not think us wholly ungrateful if we respectfully mention a few minor matters which are dear to our hearts. There is that matter of springing, you know. British roads are not materially improving. We do not know which sub-section of the traffic is mainly responsible for the indescribable pot-holiness of many once velvety highways; it cannot be the motors; perhaps the odium must be shared by the perambulating scouts and peelers who watch us so narrowly. The sad thing is that, while roads are deteriorating, your springing remains stationary. Four or five years ago you introduced some spring fork designs, which were admirable, regarded as temporary expedients, but which frankly did not deserve to be eternalised, as we fear you are inclined to eternalise them. We recognise your handicaps; rigidity, lightness, and complete insulation appear as irreconcilable as oil and water; but we trust your ingenuity, and we remind you that your oldest clients are not chickens, *i.e.*, we do not grow tougher with each passing year, and many an involuntary curse has escaped our lips as your bucking bronchos humped us over rude pot-holes in this year of grace and floods.

### Really Sound Tyres.

We would further request that you should deal faithfully with your henchmen, the tyre manufacturers. We never relished those cheap covers for which you have evinced so strong a penchant. They puncture often, they gash readily, they are soon worn out. Now that in response to our clamour for variable gears you have hemmed in our back wheels with a thousand twiddly bits, and made tyre changing a weariness in

the flesh, we are compelled to put you in a dilemma. Will you be pleased either to invent new methods of wheel detachment, or alternatively to fit a 3,000 mile cover to the rear wheel of every machine with a hub gear?

Some of us who exceed the allotted span in stature would be grateful if you provided better accommodation for our inches. Your taller clients encounter no little difficulty in stowing themselves away on your short frames, and you surely do not wish to emulate the classic hotel keeper, who kept but one bed in his hostelry, and either lopped or elongated all his guests until they fitted it?

### Belts and Gears.

We are particularly grateful for the magnificent assortment of variable gears which you have provided, but we would hint that in these days of sidecars and Porlocks we have no earthly use for any design which has a bottom ratio of not more than 7 to 1.

We think that the belt makers represent a section of your satellites who have done their manful best, and as the best belt is not too satisfactory on a 1912 design, we hope you are all offering us two-step drives for 1913. Otherwise we think that the chain drive with some form of spring or slipping clutch device, is likely to be forced upon you.

We hope you have devised some better method of carrying tools than the small, inconvenient and rattle

First appearance of the Sunbeam in competition. The machine is of 2½ h.p. with two-speed gear and oil bath chain cases. The rider is J. E. Greenwood, one of the non-stop competitors in the A.C.U. Autumn Trial in Lakeland.

**An Open Letter to the Motor Cycle Trade.—**

some pannier bags, on which you lavished a somewhat misguided affection last autumn. We fancy that a top tube bag, of decent dimensions, mounted on brazed lugs, has distinct possibilities.

If we had time to favour each of you with a representative deputation, we could display a varied assortment of excoriated knuckles. Surely it is high time that control clips were made without a multitude of sharp corners and projections, and nuts made more conveniently accessible!

We implore you to keep a statesmanlike watch on the cyclecar movement. We believe that if it is sanely directed it may open a vista of new delights for us motor cyclists; but we regard many hasty designs as uncomfortable, expensive, and even unsafe, while we think it grossly unfair that a miniature Rolls-Royce should be allowed to compete with motor cycles on even terms. We remember, too, how the early tricar was killed by over-elaboration, and we trust you to keep designs light, simple, and cheap.

**Prices and Discounts.**

We are perhaps exceeding our province when we suggest that the time has come for established makers to reduce their catalogue prices by a distinct percentage. At one time the agent who sold a motor cycle laid a train of trouble for himself. To-day he sells a certain advertisement, and starts a permanent source of increased income; he neither needs nor deserves so large a commission as was once his due. You yourselves will, of course, be inclined to grasp all the profit you can realise, just as we on our side have nostrils that dilate at the chance of discount. But there is no denying the fact that established firms make handsome profits; and we fear that envious foreign rivals will interfere before long, and com-

mandeer a good slice of your business, unless selling price soon assumes a fairer ratio to the cost of production. We would further hint that certain very costly avenues of advertisement, connected with track racing, have ceased to interest the majority of your clients.

In the name of the many duffers we number in our ranks we beg to compliment you on the high efficiency achieved by some of your automatic carburettors; and to remind you that simplification of control and maintenance of power in prolonged use are the factors which weigh most heavily with a majority among us. The open exhaust, dropped bar "knot" is distinctly over-articulate.

**Belt and Cylinder Guards.**

In respect of cleanliness we are not too fastidious; we are accustomed to removing dust and mud. When semi-charred oil is freely mingled with the aforesaid commodities, a most loathsome compound is produced, and it is distinctly loth to be removed from a profusely carved crank case. Wherefore it is not ungracious to mention that there is seldom a really sound crank case joint or tappet-guide-oil-trap among the lot of you. In this connection we may add that the lower run of your belts earns many a pound for the vendors of leg-overalls, and that the hot cylinder flanges on the far side normally assist the belt in its lethal work. If a new pair of leggings do not split on their first ride, they come home with the right knee burnt through, and the left ankle slit to ribbons. Furthermore, a rider of several leading makes can always be identified by the fact that his left boot will never take another polish in this life.

As the motor cyclist's year dates from Olympia, we take this opportunity of wishing you all, with genuine gratitude, a very happy New Year.

**A MODERNISED DE DION QUAD.**

A DE DION quad that is still in regular use must be accounted as somewhat of a rarity. The photograph shows one that is owned and regularly used by Mr. Charles Newbury, J.P., of Greenwich, a member of the Greenwich Borough Council

Mr. Chas. Newbury, J.P. mounted on his quad.

and former mayor. He finds the machine very useful for journeying to and from his country residence at Hextable, Kent.

Under the platform he has fitted a large box cross-ways for carrying fruit and garden produce from his large gardens. As evidence that the machine can still travel, it climbed Footscray Hill on top gear, whilst the other day its rider was cautioned by a police trapper on the Maidstone Road.

Various improvements have been effected by its present owner since he acquired the machine four years back from a Plumstead motor cyclist. In place of the water-cooled De Dion engine and direct drive by small pinion is a neat two-speed gear box with quadrant change and Roc type of clutch. A White and Poppe water-cooled engine removed from a tricar proved more powerful, and fifteen feet of coiled copper tubing replaced the small gilled radiator. The original frame, wheels, and tanks are used, but the large circular tank at the back is made to serve for water and oil only, and carries over three gallons. The frame tank is used for petrol, and carries two gallons.

Palmer Cord tyres are used, and a set fitted eighteen months ago are still in good order. The passenger states that the chair is better sprung and more comfortable than sidecars that she has ridden in.

## 1913 MODELS.

Advance Details and Illustrations of  
New Model Motor Cycles.

### NEXT YEAR'S JAMES MACHINES.

**T**HE James Cycle Co., Ltd., of Greet, Birmingham, have a very complete range of models for 1913, including two and three-speed chain-driven mounts and three-speed, free engine, and T.T. roadster belt-driven types. Of these, the three-speed chain-driven machine is the latest production, and shows great care in design. The engine is the same in all cases, and has a bore and stroke of 86 x 96 mm. It is now constructed entirely at the James Co.'s own works, and we were impressed by the construc-

Three-ring piston of the new James.

tional and testing methods and by the fine finish on all working parts. All cylinders are now tested under working conditions up to a water pressure of 500 lbs. per square inch, and an electrical brake testing plant is in process

of construction. The distinctive arrangement of radiator fins is retained, and the engine throughout is on the same lines as the 1912 type, but is now fitted with a very simple form of decompressor, which operates as follows: The exhaust cam is fitted with a small cam opposite the usual cam face, and the exhaust valve lifter is fitted with a

Chain side of 1913 James The grease bath chain cases have been removed for the purpose of the photograph.

toe. On moving the exhaust valve lifter laterally on its supporting pin, this toe is brought into engagement with the auxiliary cam, thus allowing a proportion of the gases to escape on the compression stroke. The cylinder head and valve ports are now machined all over, and the pistons and connecting rods are machined to a dead weight.

### The Three-speed Chain Driver.

Taking the three-speed chain-driver model first, we find that the drive is conveyed by a carefully enclosed chain to a three-speed counter-shaft gear which was described in detail in our issue of October 31st. This gear box is quite easily detachable from the frame, and has a very simple adjustment for

the chain tension, as it lies in a cradle which is machined in a jig, and consequently fits the gear box accurately. By this means it is impossible to get the gear box out of line or twisted. The gears are operated by a substantial lever, but have a compensating spring buffer arranged in the control rod, so as to render it almost impossible to damage the gears by careless changing. The rear driving chain is now entirely enclosed in a dust-proof case. Turning to frame details, we find that black celluloid-covered handle-bars are now standard on all James models. The tank has rounded corners, one seam only, and is supported from the bottom by lugs brazed to the frame. The magneto is controlled from the handle-bar. All wheels are now fitted with wide hubs, which are very strongly constructed and are of the disc adjusting type. The front guard is fitted with side flaps for its entire length, while the rear guard, which is detachable

James stand clip.

The T.T. James is belt-driven.

# re-tyre ... or ... retire

The choice is one of obvious necessity. When your tyres have carried you over thousands of miles of roads during the time which has elapsed since the season opened, it is surely wise to examine them carefully, inside as well as outside, and consider whether it would not be better **now**, before trouble comes, to replace those which have done the hard work.

Here are two favourite patterns of

## S-E TYRES

26 x 2½ in., per cover, 52/6

26 x 2½ in., per cover, 70/-

They can be relied upon to give good service on the heaviest machines, and their non-skidding properties enable you to laugh at greasy surfaces and the thick tread renders them extremely puncture-proof.

Other patterns  
from 27/-.

## —and the secret is the Spring.

To the man who has ridden other Saddles the first experience of a

## BROOKS

is a revelation in comfort-giving qualities.

And he naturally wonders "why"—

WHY this sensation of unlimited elasticity?—

WHY this total absence of that usual and irritating bounce?—WHY so superlatively comfortable?

"And the secret is the Spring"—THE BROOKS PATENT COMPOUND SPRING—the spring we illustrate above—the only spring which can entirely absorb vibration, and, at the same time, by its perfect compensating action, ensure an absolute immunity from bounce.

And that spring is an exclusive feature of the BROOKS—

Hence, you should see it and the various models in which it is embodied at

1913 Models. —

Three-quarter rear view of 1913 model three-speed James sidecar combination, showing the triangulated sidecar stays. The sidecar is a 1913 pattern Canoelet.

from the back stays, has side flaps at the front end, and is of extra width to prevent mud throwing up. The pannier toolbags are protected from mud by steel covers. Footboards are fitted, and these will probably be sprung at the rear ends. The kick starter is attached to the gear box, and all its gear is enclosed. The toothed starting quadrant has a loose tooth to ensure easy engagement.

#### Chain and Belt-driven Mounts.

The two-speed model is a replica of last year's type, with the exception of the frame fittings mentioned above, which will be standard on all the 1913 models. Both the chain-driven types are now fitted with a neat internal expanding rear brake. This is thoroughly mudproof, and yet does not cause the rear wheel to be difficult of detachment. The belt-driven models will be fitted with (1) the Sturmey-Archer three-speed gear, (2) the Villiers free engine, or fixed gear. In detail work these machines follow out the construction of the machines already described, except, of course, that the T.T. mounts will not be fitted with footboards.

The James Co. are now manufacturing the Canoelet sidecar under licence, and in a form which is particularly suitable to their machines. The chief variation from the standard Canoelet is the triangulated rear frame, which enables a straight tie rod to be used. If desired, a large silencer can be supplied with the sidecar, which is connected to the expansion chamber by flexible tubing. This additional silencer renders the machine almost noiseless, and it may be recalled that we made this suggestion some months ago, naturally we are gratified to see it adopted.

#### THE NEW HOBARTS.

Messrs. Hobart Bird and Co., Ltd., are making the following machines for next season: Tourist Trophy model with long-stroke  $2\frac{3}{4}$  h.p. engine; this is a very fast lightweight solo mount. 4 h.p. twin  $68 \times 76$  mm. (552 c.c.), with Armstrong 1913 free engine and three-speed gear, starting from the ground. Brooks pan seat, large tank, with auto-drip oil feed; this model is intended for sidecar use.  $3\frac{1}{2}$  h.p.  $85.5 \times 85$  J.A.P. engine.  $2\frac{1}{2}$  h.p. with  $70 \times 76$  mm. (292 c.c.) vertical engine for ladies' use, Sturmey-Archer three-speed gear, very low frame; and a similar machine for men's use. The  $2\frac{1}{2}$  h.p. machines are fitted with Eisemann enclosed magnetos, the others with the new Bosch. All have Druid forks. The new models will be described and illustrated in our Show numbers.

#### NEW QUADRANT ENGINE.

The Quadrant Co., of Lawley Street, Birmingham, are manufacturing a large twin-cylinder engine for passenger work. It has the cylinders set at  $50^\circ$  and a bore and stroke of  $87 \times 95$  mm. respectively. The inlet valves are placed over the exhaust and are particularly simple to remove. The design of the engine is characterised by its simplicity and strength. The operation of the valve gear will be observed from the illustration reproduced. A straight induction pipe is used with the carburetter, placed exactly central.

Quadrant inlet valve dome.

New Quadrant twin-cylinder engine. It is described on this page.

This new engine is to be fitted to a chain-driven bicycle with change speed gear, and should then make a fine machine for passenger work.

The original Quadrant Co. was one of the first firms in this country to take up the manufacture of motor cycles, and it is pleasing to note that, despite vicissitudes, the name Quadrant is still to the fore.

1913 model 6 h.p. Martin-Jap three-speed machine.

New design 7 h.p. two-speed Indian. Observe the rear springing, which is now standard.

## SPRING FRAME INDIANS.

THE latest pattern Indian is a distinctly handsome machine. The chief novelty lies in the springing of the rear portion, which is clearly shown in the accompanying sketch. There is a substantial lug at the rearward portion of the frame, which is further stayed by an additional saddle tube. To the lug referred to is bolted a seven-ply laminated spring. The chain stays are hinged at the bottom of the supplementary saddle tube, as we have termed it, and are free to move in a hardened steel bush, while there is a further movement of the vertical stay surrounding the rear mudguard and bolted to the after end of the chain stay. A further improvement is the fitting of the gear box. This is now held in the reverse position to what it was in last year's models, and is suspended in a slotted bracket immediately behind the saddle tube proper. Over the slotted bracket are plates which prevent the ingress of wet and grit. The fixing is particularly neatly carried out. It also

has the advantage of allowing the chains to be easily adjusted when occasion demands.

Indian front hub showing attachment of stand. Also observe mudshield over pivot.

## The Low Saddle Position.

Referring to the frame, it will be noticed that the saddle position is extremely low; in fact, the top of the saddle is considerably lower than the level of the top tube. The engine remains unaltered, except that the big ends are provided with roller bearings. The carburetter, spring forks, etc., remain as before. The silencer, however, is now fitted with a tapered exhaust tube. There is nothing in the silencer to retard the flow of the gas, and yet its velocity is so far reduced that the

Indian gear box showing the slide rails with covered-in slots.

Chain side of the 1913 pattern 7 h.p. twin-cylinder Indian.

exhaust is almost inaudible. Reference to the illustrations will show the extremely long pedals fitted to the brake on one side and to the clutch on the other. These allow enormous braking power and very easy withdrawal of the clutch. The foot-operated brake is of the internal expanding type, and that controlled by hand by the lever on the long handle-bar of the external type, one brake being fitted outside the other. Folding footboards are fitted. It will also be noticed that the chains are very efficiently guarded in the 1913 model. Particular attention has been devoted to mudguarding, the guards measuring 4 in.

# B.S.A. MOTOR BICYCLE

FITTED WITH THE

## B.S.A. Two-Speed Free Engine Hub

To detach the rear wheel of the B.S.A. Motor Bicycle, fitted with the B.S.A. Two-Speed Free Engine Hub, is practically as simple an operation as removing a wheel with ordinary hub. There are only two additional nuts, both easy of access, one on friction arm and one on actuating lever as illustrated. The latter nut releases the control, which being fitted **ON ONE SIDE ONLY**, greatly simplifies detaching or replacing the wheel. The adjustment of hub and control is not affected.

The B.S.A. Motor Bicycle, fitted with the B.S.A. Two-Speed, is the ideal combination for solo and side-car work. Starting away from the free engine position, which is **perfectly free from friction**, the movement of a single clutch operating both gears, takes up the drive with silent smoothness. The B.S.A. Two-Speed is the simplest, most efficient, therefore best change speed hub on the market.

#### THE HUMBER SIDECAR.

Humber, Limited, have decided to add a sidecar to their range of 1913 models. Our photographs show—(1) The chassis design and (2) the complete sidecar attached to a three-speed bicycle.

across, a far greater width than usual. An extremely strong lamp bracket is now supplied. The method of carrying the toolbag at the rear of the carrier, which is now rigidly and independently fastened to the frame, is well worthy of attention. Immediately below it the number plate can be carried. The tyres are of ample dimensions, being almost 3in. Altogether the machine has an extremely handsome appearance, and should be ideal for sidecar work. The only other model to be listed for 1913 is the 3½ h.p., which in the main closely resembles the 7 h.p. we have just described.

#### ENCLOSED DRIVE BRADBURY'S.

We recently inspected two Bradbury machines with enclosed drive. One was a chain-driven model with both chains enclosed, and the other a belt-driven machine with a guard running completely round the belt and between the wheel and belt rim. These guards are the work of the Coventry Plating and Presswork Co., which firm also showed us a guard constructed for the Bradbury belt-cum-chain model, in which the chain is entirely enclosed and the belt is enclosed all but the outside. All these guards are easily detachable and are made of tin with the exception of the inspection doors on the chain-driven types, which

Rear portion of 1913 Indian showing the laminated rear springs and arrangement of carrier.

are aluminium spinnings neatly hinged to the guard.

#### ROC THREE-WHEELERS.

A call at the Roc works proved a revelation as to the number of three-wheelers being turned out by the firm. A large number of these are light delivery vans; and when we say that they have been sent to such far away spots as St.

Petersburg, Melbourne, San Paulo, Bombay, and Corea, it gives a fair idea of their popularity. We saw one of these machines, fitted with a twin 6 h.p. engine, which will be on view at Olympia, but there are only to be detail alterations to the machine, which has proved very satisfactory. The chief of these refinements will be the fitting of a hand brake, which acts on the belt rim in a similar fashion to the usual motor cycle foot brake.

#### THE NEW TRIUMPHS.

We inspected the 1913 Triumphs last week, but our illustrated description must remain over until next Thursday. There is but little change in this highly successful mount, though improvements in detail work are noticeable. The silencer has a long pipe extending to the rear, and is minus a cut-out. From experience we know this arrangement to be highly efficient. The three-speed model has a new form of changing mechanism, somewhat similar to the long lever used on the T.T. machines. It is attached to the tank tube immediately behind the engine. A new design front mudguard has been adopted, rendering the shield over the magneto unnecessary. A decompressor may also be expected as standard on 1913 Triumphs.

Chain-driven Bradbury with entirely enclosed transmission.

A Bradbury with complete belt shield by the Coventry Plating Co.

## NORTON.

THE frame of the 1913 Norton has the ball head, top and bottom lugs made in one piece. The frame tube from engine to ball head passes right through the bottom lug and mitres against the socket tube; flush joints to the top and bottom tubes make a neat appearance, and a flush joint is also used at the seat tube. The fork ends shown in the annexed sketch have been so made that when refitting the rear wheel with three-speed hub the spindle may be lodged on the projection of the fork end, and so facilitate reassembling.

The stand is of the spring-up type, i.e., when the machine is wheeled off the stand it springs up without the rider

Spring-up stand new fork end and rear guard fitted to 1913 Norton's.

bending down to lift it or fasten it in position. The front fork on the sidcar model has been considerably widened at the struts, but they narrow to the usual width at the front wheel spindle. Side extensions to the mudguards have been added. We illustrate the rear guard with side wings or extensions, which are so designed as to keep mud and water off the belt.

The aluminium footboards are now placed above the engine pulley, and are attached to one of the crank case bolts

Expansion chamber fitted to the right side of Norton silencer.

nearest to the cylinder. The standard model will in future be fitted with an expansion chamber on the silencer. We illustrate this. From the expansion chamber a long tube leads to the rear of the machine, and is clipped to the mouth of the expansion chamber by means of a cross pin, the end of the expansion chamber being split for the purpose.

The 1913 Norton cylinder has an air-cooled passage cast between the combustion and valve chambers, radiators being cast on both sides of the passage. The standard piston has been lightened and webbed and now weighs only 16 ozs.

A patent duplex steering sidcar attached to a Clyno. The sidcar wheel, as will be noticed, is connected to the handle-bars of the bicycle. It will be exhibited at Olympia.

One piston ring only will be used in conjunction with the Norton oil grooves, and the connecting rod has been improved by rounding off the I section in such a manner that it approximates nearer to a solid rod. The chain cover for the magneto, instead of being of stamped brass, is now cast in aluminium, and presents a very neat appearance. Mr. Norton is engaged on a new sidcar with semi-streamline shaped body; the body will be made of wood and hung on long shackles between C leaf springs, which are inverted both front and back. This should provide a very fast form of springing.

## FAFNIR ENGINES.

The principal Fafnir model for 1913 will be the twin 84×88 mm. engine, which will be known as the "682" 8 h.p. type. It is externally practically the same as the old 6 h.p. twin engine, 70×80 mm., except that the magneto is chain driven. Also a cyclecar engine, which is similar to the above, except that it is provided with a leather-faced cone clutch, and is suitable for cyclecars with shaft trans-

mission, in which case the engine is set longitudinally in the frame. If, however, the engine be fixed transversely in the frame, the clutch is not used, but in its stead a large outside flywheel is fitted. The 3½ h.p. type, 85×88 mm., is also retained. All Fafnir engines will be fitted with Bosch magnetos, and the new type of B. and B. carburetter; the Fafnir two-speed gear is also made adaptable to all these engines. This gear is a highly practicable and well-tried type and really deserves to be better known. The pulley is driven by enclosed gears from the engine-shaft, and the gear incorporates a free engine clutch and two speeds, the change being effected by means of dog clutches. All models will be fitted with adjustable tappets.

## A.S.L.

A new design two-speed gear will be introduced on the 1913 model 3½ h.p. A.S.L. It is placed in front of the engine, whence the drive is by belt from a 6in. pulley to a 14in. belt rim. The drive between the engine and gear box is by an enclosed chain running in oil.

Side and end views of the "682" 8 h.p. twin-cylinder Fafnir cyclecar engine, showing magneto drive and leather faced cone clutch.

The new design 3 h.p. twin-cylinder Enfield for 1913.

## ENFIELD.

THE principal new model Enfield for next year is the 3 h.p. chain-driven twin. This machine has a V engine with cylinders at  $60^\circ$ , bore and stroke  $60 \times 75$  mm. = 425 c.c. The cylinders are held to the crank case by a double dog in the centre and a separate dog on each side. The usual bolts and nuts used to fasten the cylinders to the base are done away with, and all that is necessary to remove the cylinders is to undo three nuts, which are easily accessible, one to the central dog and the others to the side dogs. This arrangement greatly facilitates the removal of the cylinders and the cleaning of combustion heads.

The inlet valves are mechanically operated by overhead rockers and long tappet rods, the mechanism on combustion head being covered by a dome. This dome has a bayonet joint, and when the valve cage is screwed down to its seat the dome is inserted, turned through about one-eighth of its diameter and locked upwards. The dome forms a complete cover for the inlet valve and its mechanism, and on it is cast a union for the induction pipe which connects to the two-lever Amac carburetter, placed between the cylinders.

A new feature of the 3 h.p. engine, which, by the way, is made throughout by the Enfield Cycle Co., Ltd., at their Hunt End Works, is the mechanically forced lubrication. This is effected by means of a gear pump fixed to the side of the crank case and driven off one of the timing wheels. At the rear of the seat tube is a cylindrical glass oil tank, the glass being practically unbreakable owing to its thickness—a quarter of an inch. The tank holds sufficient oil for a considerable distance; in fact the same oil is used over and over again until its viscosity be destroyed, when, of course, it should be renewed. Oil is pumped from the glass tank and conveyed in a tube to a hole in the main shaft, through this it passes and on through a web in

the flywheel to the connecting rod big end bearing. Channels are cut in the sides of the bushes and the connecting rod bearing to allow the oil to overflow into the crank case sump, whence it is pumped back to the oil barrel through a tube which stands up in the centre of the glass tank and is bent over near the top.

When the engine is running, a continual flow of oil from this tube acts as a tell-tale and enables the rider to verify the lubrication and also the quantity of oil that is delivered to the bearings. The supply is governed by a needle valve with a knurled top.

The air release is fitted at the back of the crank case and communicates with the timing gear case, the cover for which is the whole diameter of the crank case. There is a partition cast between the flywheels and the timing gear. To remove the timing gear cover it is only necessary to undo a few nuts, when the cover can be lifted off with the pump and magneto drive *in situ*.

The silencer is fitted longitudinally below and just to one side of the crank case, the exhaust pipes leading into the top of it at each end. This exhaust box acts as an expansion chamber, and the taper silencer pipe extends from the rear end of the box to a point close to the rear wheel axle. We append a diagram of the mechanically forced lubrication showing the path of the oil from the tank through engine to the sump and back to tank.

The engine is a particularly well-made and well-finished job and looks very workmanlike. Its running on the track at the rear of the works proved it to be well balanced and capable of good speed.

## 1913 Models.—

The new model 3 h.p. Enfield is provided with a kick starter. The mechanism of this has no ratchets, pawls, or other parts to get out of order, and is made on the same principle, so far as the free-wheel portion is concerned, as the 1912 free-wheel pedalling gear.

**The 6 h.p. Sidecar.**

Over 700 of these machines have been sold this year, and it is not surprising to hear that, owing to the great success of the combination, only minor detail improvements have been found necessary. A new 6 h.p. J.A.P. engine fitted with a decompressor and timing gear, which is said to be quite silent, will be used, also an enlarged petrol tank holding just over two gallons. This latter is readily detachable.

Three stands are now employed on the 1913 sidecar model, viz., rear and front stands for the bicycle and a sidecar Readers will remember that the Enfield sidecar is specially attached to the bicycle in such a manner that when attaching or detaching it is impossible to get the sidecar out of alignment. This sidecar has only been sold so far as a complete combination; next year the bicycle will be supplied as a solo mount.

At Redditch we inspected parts of an experimental vehicle which Mr. R. W. Smith has designed with a view to meeting the demand for cyclecars. The Enfield Co. are no new firm to cyclecar construction. As far back as 1899 the first Enfield quadricycle was exhibited at the Stanley Show, and some are still running. The firm still have one of these Quadricycles, fitted with a 2½ h.p. De Dion engine and two-speed gear, in good running order.

Although the company is not thinking of marketing the sociable seated Enfield Auto-Quad just at present, experiments are being made with a cyclecar, which will be running about in a few days, and we had the pleasure of examining the first of these machines. Mr. Smith is ever-willing to be ready for a public demand, and is making preparations to cope with it. The Auto-Quad will be made on motor cycle lines, and many

Valve side of next year's model 6 h.p. Clyno.

parts used on the sidecar model will be employed in its construction. The general lines on which experiments are being made are: Enfield 4 h.p. water-cooled twin V-engine in front under a bonnet; the Enfield two-speed gear with chains to a counter-shaft and balance gear carried in ball bearings on the frame, the final drive being by chain from each end of the balance geared axle to the road wheels.

The total weight of the vehicle will not exceed 4 cwt. There is no intention of exhibiting the machine or taking orders for it until it is proved to be thoroughly reliable, and readers should not write concerning it until further announcements appear in *The Motor Cycle*.

**CLYNO.**

**A** CALL at the Clyno's new works at Wolverhampton proved to us that the firm have no intention of being left in the lurch during the coming season. The new model has, with the exception of the engine, been entirely redesigned by Mr. W. Comery, the company's consulting engineer. The only points which have been altered on

the 76×82 mm. twin engine are the valve ports, which are somewhat more free, and the release valve to the crank case, which has been made larger and exhausts through a pipe on to the front engine chain. The clutch two-speed gear has been superseded by a substantial counter-shaft three-speed in combination with a multiple plate clutch. A fourteen tooth sprocket is mounted on the engine-shaft, and driven by means of coil springs which absorb the shock; it is connected to a clutch member on the counter-shaft by a special ¾ in. Hans Renold chain. The clutch itself is a very neat piece of work, and has forty plates of alternate phosphor bronze and pen steel; these are enclosed and run in oil, and may be dismantled without disturbing the clutch spring. The operation is by foot on the near side, the pedal being connected to the actuating bar by a stout wire cable running over a pulley; a light spring keeps the bar from wearing the push rod when the clutch is engaged. The gear box is of the sliding type, and is carried by four bolts under a slotted platform which is built into the frame. To adjust the front chain, it is only necessary to slack the nuts, which are very accessible, and rotate a specially made screw which forces the gear box in the required direction without the possibility of it getting out of line. The gears are of the sliding type and provide ratios of 4½ to 1, 8½ to 1, and 14½ to 1, and are designed in an unusual manner, as the sliding portion consists of one gear wheel and one dog only. To obtain the high gear, the gear wheel is meshed with an internally cut wheel in the mainshaft constant wheel, and when this gear is in action the layshaft is disengaged, thereby saving a certain amount of friction. For the middle ratio, first the constant wheel is engaged, and then the sliding gear wheel meshes with a corresponding wheel on the layshaft (this by one motion of the striking gear). For the low speed the dog engages with a similar device. The gearshafts are mounted on ball bearings throughout. From the box, power is transmitted through a single ¾ in. chain to the rear wheel.

It is here to be mentioned that both chains and clutch gear are totally enclosed

The new Clyno three-speed gear dissected.

(1) Chain side and (2) valve side of the latest two-speed Wulfruna.

by roomy but neat aluminium cases which may be detached fairly easily, though this should be seldom necessary, as will be judged from the fact that the wheels are of the detachable type. These wheels are manufactured by the Clyno Co., under the patents of Mr. McGhie Lamb, whose device has been illustrated in this journal. It will be remembered that

its adjustment is not affected when the front chain is tightened. As the new Clyno is essentially a sidecar machine, all sidecar lugs are made with the frame, as are the carrier lugs. This is a commendable point of design.

The tank is now carried on three lugs brazed to the lower bar, the central one forming a support for the gear striking quadrant. The oil tank will be circular and let into the main tank, the oil being fed by air pressure through a sight feed drip. Straight clutch and brake pedals will be used, so that they may be conveniently operated from the long metal footboards. The latter have holes drilled at their lowest point to allow water to escape. 26in. x 2½in. tyres are fitted as standard, but the guards and forks are constructed to take 3in. tyres, which the firm strongly recommend, and will fit, to order, as an extra. The front mud-guard has useful side wings, and the rear guard is detachable from the back stays. An automatic carburetter will supply the gas. Two levers will be placed on the handle-bar in the usual way, but the upper will control the magneto and the lower the

carburetter. The 1912 silencers will be replaced by aluminium castings, and a long pipe will extend to the rear. Unfortunately, the very latest model was not in its complete form, but we are able to illustrate the experimental vehicle, which embodies most of the alterations, also the unfinished parts. The sidecar chassis has been strengthened, and a new body is fitted, otherwise the alterations in this part are insignificant. An unusual feature, however, is the inclusion (as an extra) of an internal expanding brake for the sidecar wheel, to be actuated either by the driver or passenger.

The knuckle joints throughout the machine are neatly rounded off. This adds greatly to the general finish, and appearance.

While in the works we inspected an interesting experimental frame (which will not be marketed), in which the frame tubes are used as oil reservoirs, leaving the main tank for petrol only. The advantages of this construction are, however, said to be counterbalanced by its disadvantages.

Clyno power unit, also showing the three-speed counter-shaft gear.

they run on ball bearings separate from the sprocket, and may be detached by merely withdrawing a central bolt. The chief alteration to the device as described is that the driving jaws are now on one side only, a distance piece being mounted on the off side. The wheels are quite interchangeable. The adjustment for the rear chain is on cycle lines, but the jaw on the near side, which takes the greater part of the driving strain, is carried right round so as to give extra strength. A powerful internal expanding brake is now fitted to the rear wheel and operated by a pedal on the off side.

To suit the improved construction the frame has been considerably modified. A front wheel stand has been added. A dropped top tube is now standard, and the bottom bracket is a large casting which forms the rear part of the engine cradle, and also a carrier for the gear box and magneto. The kick starter has been brought to the off side and is now partially enclosed; it is mounted with the gear box so that

Chain side of the 1913 two-speed belt and chain-driven L.M.C., showing the kick starter.

## 1913 model P. &amp; M. Engine increased in capacity. Detail improvements.

Chain side of the 1913 P. and M. Observe the new drip feed lubricator and tank with rounded edges.

**A**T a casual glance it would be hard to say where these new models have been altered, the general design being the same; but a careful examination soon reveals that little things have been added here and there, all which go to make the P. and M. what the makers claim, namely, a clean, reliable, and comfortable mount combined with speed and quietness.

As the P. and M. is so much used for sidecar work, the makers decided to strengthen up the frame, to fit a somewhat stronger stem to the handle-bars, and to use an extra pair of girders to the spring forks, at the same time allowing a bigger movement to the fork blades; the back hub has also been strengthened at the point where the sprocket wheel is fixed, and the engine will now be 499 c.c. as against 465 c.c. in 1912, this increase in cubic capacity being obtained by enlarging the bore.

The mudguarding problem has received special attention, and channels are being fitted to prevent splash and to allow liquid to drip back to the road. The back mudguard has an extension to below the chain, and is of peculiar formation to allow the new pattern saddle, which is specially made for the P. and M. by Lycetts, to carry out its proper function without fear of any bumps or jars. The saddle itself is of the padded pan shape, being exceptionally comfortable. The saddle-pillar lug is now brazed to the frame in a lower position, and thereby an exceedingly low seat is obtained.

### Engine and Gear Details.

The only alteration to the well-tried two-speed gear is the substitution of a new type of four-point thrust bearing, made by Hoffmann, and for which the following advantages are claimed: still more foolproof, sweeter in action, and less attention to lubrication needed. The carburetter float chamber is deeper, and the drain tap, instead of being fitted to the tank, is now placed directly under the jet, thus, by removing the tap, the jet is also removed, and, if necessary, to clean the jet, all one need do is to insert a piece of fine wire through the tap and thus up the jet hole.

The valve cams have been redesigned and now open and close quicker, and

although the actual duration of the movement is the same, the valves remain open at the fullest extent for a longer period. The valve box is a trifle bigger and the valve gear bushes longer, the reason for this being to obtain an absolutely clean engine, no oil now being able to escape. The exhaust valve lifter fulcrum will be placed on the inlet valve

The gear locking device.

tappet guide, and thus a much bigger movement to the exhaust valve is obtained.

An entirely new silencer is fitted, and whilst giving exceptional silence it is said to cause no back pressure.

The old style lamp bracket is now discarded, and in its place special lugs are brazed to the forks, lamp fittings being easily obtained from the various makers.

The foot starter has been redesigned, a stronger sprocket and chain being fitted, the chain having an adjustment by means

of a drawbolt; there is also a special adjustment for the engaging block and a spring buffer to relieve the return of the starter. The back pedal brake lever is fitted in a more accessible position, and the gear changing lever is now placed further forward.

The driving chains remain the same, but the short chains are now practically enclosed, the cover fitting close up to the engine and is not cut away as before; an extension of the cover is carried over the top of the long chain.

The eccentric shell whereby adjustments of the chains are obtained has been altered, and it is now an easy matter to make the adjustments to a nicety. The tank is much neater being cut away at the front and having rounded edges. Spring filler caps are fitted, and in place of the old style oil pump a Best and Lloyd semi-automatic drip feed pump is used. The tank is now supported on lugs brazed to the tube, leather washers being placed between the lugs and the tank.

### The New Locking Device.

In previous years when the chains on the P. and M. required adjusting it was necessary to loosen the eccentric by means of a hammer and chisel, make the adjustments, and obtain the help of another person to keep the adjustment correct while you again hammered up the locking ring. Now, however, a complete shell has been fitted into the bracket, and at one end of the shell is a toothed circle, fig. 1A, which is locked by means of the nut, fig. 2. When an adjustment is required all that is now necessary is to undo nut fig. 2, then nut B fig. 1, pull away the part C, and revolve A to position required, replace C, tighten up nut B, and finally locking nut fig. 2, and the adjustment is made with ease.

### 1913 P. and M. Sidecar.

Messrs. Phelon and Moore, Ltd., have designed a new style of chassis which is being built for them by Messrs. Mills-Fulford. The main points are lightness, strength, and comfort. Mud-guarding has received especial attention. The springing is by means of underslung cee springs, which make it exceptionally comfortable. The weight, with coach-built body, was given as about 76 lbs.

Valve side of 1913 P. and M. the engine of which is 85 x 88 mm.

## A.J.S.

**M**ESSRS. A. J. Stevens and Co. will confine themselves to two models during next year—a 6 h.p. twin and a  $2\frac{3}{4}$  h.p. single. As the 6 h.p. model is almost a twin-cylinder replica of the  $2\frac{3}{4}$ , a description of it will suit both types.

The engine has a bore of 74 mm. and stroke of 81 mm., the cylinders being set at an angle of  $50^\circ$ .

A steel piston is now employed having two top rings and a broad spring steel ring to retain the gudgeon pin; this pin is hollow and is prevented from rotating in the piston boss by a set pin. Although the new piston is both of greater diameter and length than last year's, it is considerably lighter. Adjustable tappets are fitted as standard. To render the machine quieter a smaller valve lift is given, but the valves have been greatly enlarged so as to give an even freer port opening. Heavier flywheels are fitted so as to give very smooth running. A chain transmits the power to a clutch on the counter-shaft. This clutch is of the plate type, having cork insets. In the 1912 models it will be remembered that the sprocket

New 6 h.p. A.J.S. passenger model with three-speed bottom bracket gear and enclosed chains.

avoiding the unsightly mess which is only too common on counter-shaft gears.

The clutch is operated from the handlebar and the gears by a lever on the top tube. The gear ratios obtainable are  $4\frac{1}{2}$ ,  $7\frac{1}{2}$ , and  $12\frac{1}{2}$  to 1. A single chain drives the rear wheel, and both this and the engine chain are entirely and effectively guarded. Silence has been studied in an unusual degree, and to prevent any sound from the chains the cases are made of two layers of metal with packing interposed, and to dismantle either gear box, or clutch, or chains it is not necessary to remove the main portion of these cases. The kick starter is also enclosed, and its adjustment is not affected by the position of the gear box. A powerful internal expanding brake is fitted to the rear wheel, and is carefully mudproofed. Amac carburetters and chain-driven U.H. waterproof magnetos are used. Disc-adjusting hubs are now fitted.

The tank, which as a capacity of two and a quarter gallons, has rounded edges, and is held from below, a glass-topped filler cap taking the place of the usual petrol gauge. Both front and rear wheel stands are supplied, and the tool bag is covered with sheet metal. All the carrier joints are welded. Comfortable footrests are supplied having good sized heel plates. All wheels are shod with  $650 \times 65$  mm. tyres, and a large aluminium silencer is placed under the magneto platform. The  $2\frac{3}{4}$  h.p. type, as has already been mentioned, is on the same lines as the twin, but has only one cylinder. On this model a slipping clutch is mounted on the

engine-shaft, and a neat spring compensating device is fitted to the gear control rod to avoid damage to the gears. Either a two or three-speed gear can be supplied with this model.

Valve side of the 6 h.p. 1913 A.J.S. engine, showing method of holding down cylinders.

carried the insets, and was gripped between two plates, but in the new model the number of plates has been doubled. The gear box provides three speeds and is a particularly neat piece of work; the sliding member consists of a single gear wheel and two dogs, and provides a direct drive on top. Both gearshafts are mounted on ball bearings, an oil catcher is fitted round the open end of the shaft which leads any leakage down an overflow pipe to the base of the box, thus

New design silencer on the 1913  $4\frac{1}{2}$  h.p. engine.

## L.M.C.

**T**HE following models will constitute the L.M.C. group for 1913:  $3\frac{1}{2}$  h.p. L.M.C., two-speed, chain and belt gear;  $5\frac{1}{2}$  h.p., Auto Varia gear; 4 h.p., Stumey-Archer gear; 4 h.p., Roc gear; and the  $3\frac{1}{2}$  h.p. T.T. model. The engine sizes are:  $3\frac{1}{2}$  h.p.,  $85 \times 88$  mm.; 4 h.p.,  $89 \times 92$  mm. Improvements are in detail only.

The L.M.C. chain and belt two-speed gear will be provided with a new control, and the chains, instead of being on opposite sides, will be both on one side, with the belt drive on the other.

Mr. W. J. Lloyd has designed a new half-compression device; the lever for operating this is attached to the top rail. New pattern side wing, mudguards have also been adopted.

The Auto-Varia gear has been improved by fitting the coil springs in holes bored in the solid part of the pulley instead of using a separate cage as this year. The front fork has been redesigned, and will have coil and recoil springs instead of the springs being in tension alone. The exhaust valve lifter, which is of the outside type, will be so fitted that the cylinder will be easily removable. A hinged rear mudguard will enable the rear tyre to be easily manipulated in the case of tyre repairs, and a kick starter is an addition. The tank has been improved by the fitting of larger filler caps. The new kick-starter and other details are shown in the illustration on page 1261.

The A.J.S. method of transmission, showing kick starter and internal expanding brake on back wheel.

## NEW SWIFT CYCLECAR.

Features: Twin-cylinder Vertical Engine, Three-speeds, and Shaft Drive.

**A**N important addition to the numerous light two-seaters which will make their *début* at the Olympia Motor Cycle Show is the 6 h.p. Swift. We examined the machine at the company's works in Coventry the other day, and are now in a position to give the first illustrated description. Unknown to outsiders, the Swift Motor Co., Ltd., have been studying the cyclecar question for some time, and have carried out long-distance tests with an 8 h.p. air-cooled engine. The engine finally adopted, however, is a water-cooled twin-cylinder of 75 mm. bore and 110 mm. stroke, the cylinder casting being in one piece. The interchangeable valves are

arranged on one side and are enclosed by a readily removable aluminium cover. Adjustable tappets are provided, supported on hardened steel rollers. The camshaft is driven by a chain from the mainshaft, and a feature is the provision for chain stretch which is taken up automatically. The cranks are set at 180°, and the shaft and flywheel flange are forged in one solid piece of metal. Careful attention has been paid to the balance of the engine, weights bolted to the crank slabs ensuring smooth running. Thermosyphon cooling is relied upon in conjunction with a wedge shaped radiator of handsome design. The lubrication system is particularly praiseworthy. An oil

well, of a capacity of about three-fourths of a gallon, is cast in one piece with the aluminium crank chamber. By a syphoning process the lubricant in the troughs is kept at a constant level until the supply has run out, thus the worry of lubrication may be dismissed from one's mind for from three to 400 miles. A

The wedge-shaped radiator on the new Swift.

The side by side twin-cylinder water-cooled engine of the new Swift cyclecar.

single branch connects the two exhaust ports, the burnt gases being swept to the rear by a long pipe. Between the two, the inlet port is arranged with a passage formed in the casting for each cylinder. A Longuemare carburetter has been adopted, connected with which is an accelerator pedal and lever on the steering wheel.

A high-tension magneto supplies the electrical current. It is driven by a worm and worm wheel at right angles to the crankshaft, and situated in front in an accessible position.

**Details of the Chassis.**

A leather-faced cone clutch of ample dimensions is used, and a refinement is the springs placed under the leather to ensure a smooth engagement.

An idea of the care and forethought in design may be gathered when we state that the gear box is cast in one piece in order to prevent oil leakages. The gears and gearshafts are cut from the solid, and the primary-shaft is castellated. The striking gear is enclosed,

The large diameter foot brake, also showing the ready adjustment provided.

Swift gear box (cast in one piece) and operating rod, with foot brake and universal joint at the rear.

The frame is suspended on semi-elliptical springs front and rear, and the steering is by rack and pinion.

A low-built body with scuttle dash, and inside guards to the front wheels, give the Swift cyclecar a very smart appearance. The seating is novel. The passenger sits a little to the rear of the driver, not to allow a narrower frame,

Enclosed worm drive for the magneto.

but to permit the driver to get out of the car without disturbing the passenger.

The weight of the chassis was given to us as approximately 5 cwts. The wheelbase is 7ft., and the track 3ft. 4in., whilst 650 x 65 mm. tyres are fitted.

Finally, we must pay a tribute to the high-class finish of the various parts. Swift workmanship is too well known to need more than a passing reference, but certain it is that the quality of work in the Swift cyclecar will compare with anything in the Olympia Show.

Three bevel pinions are used in the Swift differential gear as shown.

**SINGER.**

The Singer Company have not found it necessary to make any great alterations in design to their 1913 models. The only alterations to the 2½ and 3½ will be in such details as the strengthening of the carrier and the provision of neat platforms for carrying the pannier bags. The standard finish will be somewhat striking, and a new silencer will be used. This consists of two aluminium castings, an outer shell which forms an expansion chamber, and a perforated pipe into which the gases escape, finally issuing to the air through a series of small holes in the end plate. The construction is rendered clear from the photograph on page 1263. The 4½ h.p. model has undergone some slightly more important changes. The engine size has been increased to 89 mm. bore x 95 mm. stroke, giving a capacity of 591 c.c. This model will be fitted in future with an adjustable counter-shaft pulley of 6½ in. diameter.

**Frame and Bodywork.**

The frame is of the tubular pattern, swept at the front to allow ample steering lock, the engine and gear box being mounted separately on an under-frame, whilst the brackets on which the engine and gear box are supported are machined after the brazing process in order to ensure perfect alignment.

Side and front views of the new P. and M. underslung sidecar attachment referred to on page 1262. The excellent mudguarding will be observed.

### TIME TO LIGHT LAMPS.

Nov. 7th	...	5.21 p.m.
" 9th	...	5.18 p.m.
" 11th	...	5.15 p.m.
" 13th	...	5.12 p.m.

### Next Week's Issue of "The Motor Cycle."

Our next issue—the first of three specially enlarged numbers in connection with the Olympia Show—will deal with passenger motor cycles of all kinds, viz., sidecars, runabouts, and cyclecars.

### Trades Benevolent Fund Annual Meeting.

The annual general meeting of the members of the above fund is fixed to take place on Tuesday, December 17th next.

### Saturday at Brooklands.

Next Saturday's closing meeting of the British Motor Cycle Racing Club has attracted a fine entry, and a number of newcomers will make their first appearance at Brooklands.

### Motosacoche 3½ h.p. Twin.

A new Motosacoche is to be marketed next year having a 3½ h.p. twin engine, the probable bore and stroke being 64×77 mm. This machine will be fitted with chain drive and a counter-shaft two-speed gear.

### Hill-climb in Yorkshire.

We are informed by Mr. C. Hurst, the hon. secretary of the Wakefield M.C.C., that no hill-climbing competitions will, in future, be allowed in the West Riding of Yorkshire in consequence of the Bradford M.C.C. holding a hill-climb in the district on Sunday, September 21st, and causing much annoyance to other users of the roads.

### Pride goes before a fall—in Cyc'ecar Shares.

A prospective customer recently called upon the maker of a cyclecar; having examined the machine he accepted the offer of a trial run. The little vehicle performed well, taking a long hill easily on top gear, but as they were approaching a sharp corner, the tester said, "See me take this corner," whereupon he put up the helm (is that correct?); but the list to starboard was so pronounced that the vehicle turned turtle and became a complete wreck. Our friend did not see him take the corner—he was, as a matter of fact, "attitudinising for the benefit of the spectators," like Mark Twain's friends upon another occasion. The passengers, fortunately, were unhurt, but—need we finish? That prospective customer still rides a motor bicycle. "*Nimia fiducia calamitati solet esse*," as the Latin grammar hath it.

### Efficient Belt Guards as Standards.

Bradbury motor cycles in 1913 will have effective belt guards as a standard fitment. The guard completely encircles the belt, and is similar in design to the one adopted by Mr. Hugh Gibson for the last twelve months. The new guard will be finished to match the tank, and will first appear on the show models.

### A Novel Transmission.

An Armstrong hub as a counter-shaft gear has been adopted by Messrs. Hazlewood, Ltd. They have fixed a sprocket in the place of the usual belt rim, and drive through a chain from the engine, thence to the rear wheel by belt, a large sized V pulley being fixed to the hub shell. The motive power of the new model is a special 70×76 mm.

### A NEW MODEL ON ORIGINAL LINES.

Both sides of the Armstrong three-speed gear fitted into the counter-shaft of the new twin Hazlewood.

twin J.A.P. engine with extra large flywheels. The machine has undergone its road trials in fine style, and will be seen at the forthcoming exhibition. A very neat and simple adjustment is used for tightening the front chain. This form of drive brings up many interesting questions, for, although the gears are running at a higher speed, for that very reason they have less driving strain.

### SPECIAL FEATURES:

#### 1913 MODELS.

Described and illustrated.

AN OPEN LETTER TO THE TRADE.

THREE ON A CYCLECAR.

### Copper and Acetylene Generators.

Motor cyclists will do well to see that no copper tubes or nipples are used in connection with their acetylene lamps or generators, or, indeed, copper in any form, as this metal or its salts is capable of causing self-ignition. A short time ago the Rev. Colin King wrote to the Acetylene Publicity Co., Ltd., to enquire the cause of an explosion, or rather a puff of flame, which occurred in a generator of American manufacture. Investigation by Mr. Gatehouse, F.I.C., public analyst, showed that this flame was caused by copper salt contained in the green paint with which Mr. King had painted the interior of the generator. This caused the formation of acetylene of copper, which has the property of emitting fierce sparks on very slight provocation. No danger can accrue from brass, of which motor cycle generators are generally made, although brass itself is an alloy of copper.

### Speed Contest at Wimborne.

The Bournemouth and District M.C.C. held a speed contest on Wednesday, 23rd ult., in the grounds of Canford Park, Wimborne, some few miles from Bournemouth, and by kind permission of Lady Wimborne were fortunate in securing the entire use of one of the private drives, practically level and safe for all speeds. The racing was carried out on the "knock-out" principle. The course was three fifths of a mile. Results:

CLASS I. Machines up to 350 c.c.—1, Thompson, Portsmouth (2½ Douglas).

CLASS II. (members' event). Machines up to 500 c.c.—1, E. L. H. Erring (Triumph); 2, O. Goodman (B.S.A.).

CLASS III. (open). Machines up to 500 c.c.—1, Bleach, Portsmouth (¾ Bat-Jap); 2, Thompson, Portsmouth (2½ Douglas).

CLASS IIIA. Machines from 500 c.c. to 600 c.c.—1, Allen, Wimborne (¾ Scott).

CLASS IV. (members' only). Machines of any capacity.—1, Gooden-Chisholm (6 Enfield); 2, H. Goodland (Triumph).

CLASS V. (open). Machines of any capacity.—1, Gooden-Chisholm (6 Enfield); 2, Thompson, Portsmouth (2½ Douglas).

CLASS VI. Passenger machines up to 500 c.c.—1, Bleach (Bat-Jap); 2, O. Goodman (¾ B.S.A.).

CLASS VII. Passenger machines over 500 c.c.—1, A. G. H. Alford, Bournemouth (6 Enfield); 2, V. Jones, Bournemouth (Morgan Runabout).

**Tank Capacities in T.T. Machines.**

The following tank capacities have been decided upon for machines competing in the 1913 T.T. races: Junior, 1½ gallons; Senior, 1¾ gallons.

**The One Day Trial.**

The Auto Cycle Union, through its secretary, Mr. T. W. Loughborough, wishes to thank each one of the army of helpers who assisted during the One Day Trial in the Lake District.

**French Motor Cyclists' Federation.**

All important French clubs were represented at a meeting at Lyons held on the 1st, 2nd, and 3rd inst. The following cylinder dimensions were decided on for racing classes: 250, 350, and 500 c.c. 750 and 1,000 c.c. were adopted for touring classes only. It was decided that all sidecar machines must have a clutch in the 350, 500, 750, and 1,000 c.c. classes. Official timekeepers will be appointed. The majority were in agreement to form an independent motor cyclists' federation, only the Touring Moto Club de France declaring that if an independent body were formed it would not remain associated to the Federation of Motor Cyclists.

**A Marvellous Recovery.**

We are glad to hear that Mr. Frank Philipp, who recently met with a bad accident in Yorkshire, is making a marvellously rapid recovery and quite thinks he will be riding in the T.T. next year. Mr. A. A. Scott informs us that he thinks there is no reason to expect any permanent effects from the injuries he received. Incidentally Mr. Scott told us that his firm expects to be in the new works at Saltaire in about six weeks. A private testing track will be a feature of the new premises.

**Unbiased!**

The following is an extract from a letter recently received from a solicitor, the name and address of whom we withhold for obvious reasons. The extract reads: "It is very difficult to get the judge in this county court to give a verdict in favour of a motorist or motor cyclist as against other users of the road." Is it not scandalous that it should be necessary for a solicitor to point out that it is difficult to get a judge to give a verdict in favour of any one class of persons?

**Particulars of the Douglas Cyclecar.**

A fortnight ago we published the first illustration of the new Douglas cyclecar, which has undergone several hundred miles of road testing. Another model embodying many improvements is now in hand. An 8 h.p. twin-cylinder air-cooled horizontal engine is used to propel the machine, the front cylinder head facing forwards. We understand that a friction drive has been used with success on the first model, a shaft conveying the power to a differentially geared back axle. The horizontal engine allows a low bonnet, and a smart and race-looking vehicle is the result. It is not definitely known whether an air or water-cooled engine will be adopted, but in any case the motive power will be no experiment, for Messrs. Douglas Bros. have been making both types for months past.

FUTURE EVENTS	
Nov. 8-16.—	MOTOR CAR SHOW AT OLYMPIA.
" 25-30.—	MOTOR CYCLE SHOW AT OLYMPIA.
Dec. .. —	Auto Cycle Union Open Silencer Trial.
" 27-28.—	Motor Cycling Club Annual Winter Run.

**French Road Records.**

The bad state of the roads caused by incessant rain during the last few days prevented the A.C.C.F. running off the proposed road record trials last week. The committee has postponed the event until there is an improvement in the weather.

**Taxation of Business Motor Cycles.**

Still another case was heard at Saffron Walden Petty Sessions recently of a motor cyclist who claimed exemption from local taxation on account of his machine being used solely for the purpose of business. The usual arguments for and against were advanced by both sides, and no one in court appeared to be aware of the magistrate's decision in the case of the Skelmanthorpe motor cyclist, Taylor, reported in *The Motor Cycle* of August 15th last. Readers will remember that the A.C.U. Legal Department defended Mr. Taylor and lost the day. The magistrates found that Taylor's "motor cycle had not been constructed or adopted solely for the purpose of business," and fined him 10s. and costs. The A.C.U. was legally advised that there would be no probability of success if an appeal were lodged, and the matter was allowed to drop. The magistrates in Saffron Walden court decided to adjourn the case until November 6th (yesterday), and advised the defendant to obtain legal assistance, the maximum penalty being £20.

**Activity at Brooklands.**

Many record attempts are on the tapis before the show. We believe that a new comer to the track, a 2½ h.p. A.J.S., will shortly make its appearance on Brooklands. We have heard wonderful reports of its capabilities on the road.

The Singer Co., too, have produced a 350 c.c. single-cylinder machine, and Stanley will shortly make an attempt on the lightweight records up to one hour.

Rudge experts are still on the track tuning up and may attempt the hour record at any time.

**The Date of the 1913 T.T.**

A great many motor cyclists are grumbling because next year's T.T. Races will not, as has been recently announced, take place over the week-end. We are sorry to have to say that there is no doubt that motor cyclists have brought the alteration on themselves, as the number of complaints about motor cycles being ridden at speed through Douglas, and in the island generally, on the Sunday has urged the authorities to request the A.C.U. to hold the race in the middle of the week, so that Sunday does not intervene.

**Another New Club.**

About forty persons interested in the running of cyclecars, of whom about fifteen were actual owners of these vehicles, met together at the Holborn Restaurant on the evening of the 30th ult., with the object of founding a club to be known as "The Cyclecar Club." The Rev. E. P. Greenhill, was in the chair. In his opening speech, Mr. Greenhill stated that he considered the time had come when the cyclecar needed its own organisation to further its interests. It was finally decided that the club should be formed, and Mr. F. Thomas should be elected hon. secretary. About thirty-one of those present were elected to form a committee to elect the first committee of the club and to arrange details. These met together yesterday evening.

**A NINE HOURS' CYCLECAR RECORD ESTABLISHED.**

The 8 h.p. Duo which set up long distance cyclecar record last week with two passengers.

# NEW CYCLECAR RECORDS.

## A DUO AVERAGES 37 M.P.H. FOR NINE HOURS.

On the 30th ult. a Duocar, driven alternately by L. de Peyrecave and J. McArthur, established several new long-distance records. Heavy rain fell off and on during the day, there was a high wind, and, owing to the rain, the track was very wet for the first three hours and the last

two hours of the performance. New cyclecar records from three to nine hours were made, also the 150, 200, 250, and 300 miles records. Nothing occurred of any sort except a stop to change a sparking plug half an hour from the start, and the engine was not stopped once during the run. The performance is an extremely good one, as a passenger was carried throughout, and the car was quite a standard model fitted with a comfortable two-seated body. The Duocar, which is the product of Duocars, Ltd., 76, York Street, Westminster, was fitted with a twin-cylinder J.A.P. engine (85½ x 85 mm.), Lurquin carburetter, and Bosch magneto. The tyres were Stelastie, the belts Duo, and Pratt's motor spirit was used. Below is a table showing the total distance covered, average mileage per hour, and hourly distances. Asterisks, denote new records. A. V. Ebbelwhite took the times:

J. C. McArthur and L. F. De Peyrecave who drove alternately during the nine hours' record at Brooklands.

Hours.	Distance. mils. yds.	Average		Driver.
		m.p.h.	Distances. mils. yds.	
1	35 1,120	35.63	35 1,120	L. de Peyrecave
2	74 1,200	37.34	39 80	" "

*250 "	...	6 30 43	38.39	" "
*300 "	...	7 58 40½	37.60	L. de Peyrecave

## MOTOR CYCLE TAXATION.

The Auto Cycle Union has appointed a powerful committee representative of all motor cycling interests in the country to impress upon the Government the iniquity of the proposed increase in taxation, and to formulate and adopt every means possible to prevent the said proposals becoming law, also to adopt counter proposals. The composition of the committee is as follows:

Chairman: The Hon. Arthur Stanley, M.P.

Vice-chairman: Mr. Otto Thomas.

Representing A.C.U.: Major Lindsay Lloyd, Major Nicoll, and Mr. Archibald Sharp, B.Sc.

Representing A.A. and M.U.: The Rev. F. W. Hassard-Short, Messrs. R. H. Head, and Chas. Jarrott.

Representing the Scottish A.C.U.: Messrs. Norman McMillan, John Gow, and J. S. Fulton.

Representing the Manufacturers' Union: Messrs. C. Vernon Pugh, T. H. Tessier, and W. H. Wells.

Secretary: Mr. T. W. Loughborough.

In the circular sent out by the A.C.U. appear copies of letters which have been published in *The Motor Cycle*,

several of the arguments that have been raised against increased taxation, and additional arguments. Accompanying the circular is a printed statement signed "T.W.L." This article is a criticism of the Treasury Committee's recommendation. In it the writer points out that it is an acknowledged fact that the R.A.C. rating rule as applied to cars of different ages is useless as a measure, comparative or actual of power, whereas the rating basis on cubic capacity gives results that are much nearer the truth. As evidence of this, he mentions the figures published in the *R.A.C. Journal* on the b.h.p. tests of twenty-seven different cars dating from 1903 onwards. He also points out that if the Committee had adopted or suggested a cubic capacity rating for motor cycles it would have involved admission of the unsuitability of the R.A.C. rating for motor cars, and says "three pages of the report are therefore devoted to clever pieces of special pleading in defence of the R.A.C. rating rule, and it is recommended with much plausibility that motor cycles be similarly rated for taxation purposes."

## AMATEUR MOTOR CYCLISTS' ASSOCIATION.

The committee met on Thursday evening last at the Auto Cycle Union premises, and with the assistance of Messrs. J. Simmons (Nottingham), H. Karlake, B. T. Rice-Pyle, A. M. Rundall, and J. Hopkins, the definition of an amateur for this Association was finally fixed as follows:

1.—Membership to the Amateur M.C.A. shall be open to those fulfilling the following definition of an amateur:

(a.) A member must not be connected directly or indirectly with the manufacture or sale of motor vehicles, or accessories, or parts, used in conjunction with them.

(b.) Must not be in the trade employ of anyone in connection with the above, or receive any payment in money, goods, or other assistance for riding, other than prizes.

(c.) Must not receive what is, in the opinion of the committee, advantageous terms in the purchase of motor vehicles, their parts, or accessories.

The definition is not retrospective.

The membership fee has been fixed at the nominal sum of 5s. The promoters have decided to go ahead with the scheme. There will be a committee of management and three stewards appointed who will hear appeals which may arise in applying the definition to individual members. The Auto Cycle Union has been asked to nominate one of these stewards. Clubs who wish to adopt the A.M.C.A. definition and prospective members should communicate with Mr. C. C. Cooke, Rose Cottage, North Mymms, Hatfield.

Three special issues of "The Motor Cycle" will be published in connection with the Olympia Motor Cycle Show, dated Nov. 14th, 21st and 28th.

## CLUB NEWS.

## Motor Cycling Club.

A smoking concert will be held on the 19th inst. at the Crown Room, Holborn Restaurant, at 7.30., Mr. C. Jarrott in the chair. Members of the A.C.U. and all clubs are invited.

## Foleshill and North Warwickshire M.C.

The result of the recent reliability trial was as follows: 1. A. Broad (3½ Triumph); 2. F. Rollason (3½ Ariel); 3. F. Miles (6 Rex-Jap and sidecar); 4. J. W. Barfield (3½ Triumph). The route was 105 miles, and included four ascents of Edge Hill and Sunrising. It was raining most of the time, and although the first, second, and fourth rode single-gear machines they did not fail on hills.

The club will hold their first annual dinner and smoking concert at the General Wolfe Hotel on the 19th inst.

## Lincolnshire A.C. (Motor Cycle Section).

A petrol consumption trial will be held on Saturday next, the 9th inst., starting from top of Cross Cliff Hill, Lincoln. Petrol tanks will be emptied, and one-half gallon of petrol served out to each rider. The course will be to Sleaford, *via* Leadenham, returning to starting point by the Sleaford Road, past Dunstan Pillar. Distance, 35½ miles. Maximum time allowed for the run, two hours. Formula (highest to win):

Weight of rider and machine × Distance × C.C. Factor.

Petrol in ounces

## Bristol M.C.C.

The last trial of the season (for amateurs only) was held on the 2nd inst., in beautiful weather, over a very hilly course of about 18½ miles, which had to be covered twice. Seventeen entries were received; there were fourteen starters. Weston Lane, near Bath, had to be ascended twice. Results: 1. F. C. Wasley (2½ Douglas, two-speed), error 30s., wins Humber Cup; 2. H. Hutchinson (3½ Rudge), 43s.; 3. A. G. Barr (3½ Bradbury, N.S.U. gear), 116s. These three were the only finishers, all failed on Weston Lane except Kellar, Synnes, and Clement.

## Bradford M.C.C.

Result of reliability trial to Morecambe and back, October 19th. 1. C. Hart (3½ Rudge); 2. P. Shaw (P. and M.); 3. C. Green (3½ P. and M.). Other riders who finished the full course were: F. Wild (2½ A.J.S.), F. Hodgson (3½ Bradbury and sc.), F. Haswell (3½ Bradbury and sc.), F. L. Harrison (5 A.J.S. and sc.), A. Grimshaw (6 Clyno and sc.), and N. Jagger (3½ Bradbury). F. Atkinson (3½ Bradbury and sc.) ran into a tree near Lancaster and was put out of the running. Result of speed trials held October 26th. These trials were held in two classes, solo and sidecar, with a total of twenty-three entries. Result of solo class: 1. Stanley Croft (T.T. Triumph), winner of the W. Biggs cup and gold medal; 2. F. Wild (2½ A.J.S.), silver medal; 3. Joe Laycock (T.T. Bradbury), bronze medal. Result of sidecar class: 1. W. R. Lake (8 Chater-Lea), winner of the Triumph cup and gold medal; 2. C. Hart (3½ Rudge), silver medal; 3. A. Grimshaw (6 Clyno), bronze medal.

## Birmingham M.C.C.

The club billiard room was opened on the 1st inst. There was a capital attendance, and the scheme, which is to have a private billiard and card room at the Grand Hotel every Friday night during the winter season, seems an assured success. On the 2nd inst., the annual autumn reliability trials were commenced. There were fifteen entries, and all but two completed the course. At the end of the run the competitors joined the members of the South Birmingham M.C.C. at a smoking concert at Hockley Heath.

## Walthamstow M.C.

A competition was held on the 3rd inst. over a very hilly course in Essex, for prizes kindly presented by Messrs. Godfrey and Applebee. Competitors were credited with 100 marks at the start, ten being deducted for every stop on a hill and five for any other cause (traffic excepted). The severe gradients and sharp corners called for tricky driving by the single gear brigade. All three winning machines were fitted with speed gears. There were thirteen starters—seven failed on hills and six made non-stops. Results:

Rider and machine.	Time error.
1. G. West (5 A.C. tricar) ... ..	7½s. slow
2. W. S. Low (3½ Scott) ... ..	11s. slow
3. J. Beal (3½ N.S.U.) ... ..	15s. slow

## Motor Cycle Union of Ireland (Ulster Centre).

The first winter reliability run of the season was held on Saturday, starting at Fortwilliam Park, Belfast, and including in the course Larne, Ballymena, Ballycastle, Cushendall, and Carnlough, giving a total mileage of 133½ miles. For the event, the Triumph Cup (to be won twice in succession) and an accompanying prize were offered for the winner, and the second prize was the Rudge-Whitworth Cup.

The start took place in a heavy mist, which as the day advanced developed into a regular downpour, whilst the wind blew with hurricane force, and the plight of the riders when traversing the Ballycastle mountains and on the open coast road with the waves breaking over was terrible. Sidecars, with the exception of W. J. Chambers (3½ B.S.A.) found the task so difficult that they failed to finish, and the latter would have been well amongst the prizes if he had not experienced magneto troubles through the wet. J. Stewart (2½ Douglas) also had magneto troubles, and lost three marks through being delayed on that account. T. Moles (3½ Triumph) gained full marks throughout, and was closest to schedule at the secret checks. He inadvertently ran through a secret check, and withdrew his claim to the prizes, receiving for his sportsmanlike action the subsequent thanks of the committee. Result:

	Marks at open controls.	Variation from schedule at secret checks.
*1. W. Dowse (3½ Dot) ... ..	60	2m. 32s.
†2. G. Dowse (3½ Dot) ... ..	60	3m. 48s.
3. S. Pyper (4½ Dot) ... ..	60	5m. 32s.

\*Triumph Cup and prize: †Rudge-Whitworth Cup.

SATURDAY'S HILL-CLIMB OF THE OXFORD UNIVERSITY M.C.C.  
On the starting line. W. L. Openshaw (8 Zenith) starting in the sidecar class.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

#### Surface on Kirkstone Pass.

Sir,—I have read with interest your representative's remarks on the above in the One Day Autumn Trial.

Does he expect to see a steam roller there?

If your representative will inspect the thick "mud and stones" in a month's time, or less, he will find a very smooth surface. The reason for this is, what your representative describes as "mud" is a natural cement in which to bed the stones. There is no steam roller in this county that could roll the steep gradients of Kirkstone. These roads would be in much worse condition, considering the heavy rainfall and summer traffic, if it were not for this tenacious marl, which is found half-way up the pass. E.H.P.

#### Date of the T.T. Races.

Sir,—I notice your correspondent "Week-end" invites readers' opinions on the date fixed for the 1913 T.T. Race. I myself, with many others, think that it would be much better held the same as this year, and not in the middle of the week as arranged. A large party of us went over to the island this year, and we must admit we had the time of our lives. Had the race been held in the middle of the week, we should certainly have been unable to attend. Therefore I agree with your correspondent, and think it would be far better that the race should be held at a week-end, at least from the spectators' point of view.

AN INTERESTED SPECTATOR.

Sir,—I notice a letter in *The Motor Cycle* re date of 1913 T.T. Races, and notice that it is proposed to hold same on June 4th and 6th. Well, if this date is fixed, I am afraid it will prevent hundreds of people from attending the races in the I.O.M., as they would like to do—I mean people connected with "farming operations"—for the reason that, during the early part of June, hay-making is in full swing, and therefore farmers could not get away. Being an enthusiastic mechanic-farmer myself, I thought of entering the race myself next year. If it is held in July I probably shall, if in June it will be quite impossible, and I know at least a dozen other fellows just round here who are situated the same as myself. I therefore trust your valuable paper will make an effort to change the date from June to July, as was the date this year. F. K. PORTWAY.

[As regards the days selected for the 1913 T.T., mid-week is recommended by the Isle of Man authorities in deference to the wishes of Manx people to avoid Sunday riding.—Ed.]

#### Tyre Bursts on Three-wheelers and Others.

Sir,—A.C., Ltd., are making a sporting effort at Brooklands to convince the gain-sayers that "what will happen to a three-wheeled cyclecar if the back tyre bursts" is nothing. Your correspondent Mr. Lambert (*The Motor Cycle*, October 31st) has already proved it in the case of a Morgan. Personally, though I have driven our cars probably 30,000 miles, including all the chief reliability trials, I have never had experience of the effect of a back tyre burst, which, perhaps, goes to disprove these complaints of excessive strain on the back tyre of a three-wheeler. But, in theory, I cannot imagine any reason why the bursting of a back tyre, in the case of a three-wheeler, should be more disastrous than in the case of a four-wheeler. The chief danger of burst tyres lies in the fact that the collapse of the tyre suddenly decreases the size of the wheel on one side of the car and causes the car to swerve. But if the wheel is in the centre of the car this danger is diminished, not increased.

It is my conviction, from long experience with all kinds of cars, that the danger of a burst tyre is almost negligible except at excessive speed. Most frequently a tyre bursts because the car swerves or skids dangerously; very seldom does the car swerve or skid dangerously because the tyre bursts. H. F. S. MORGAN.

#### Inconsiderate Driving in Bedfordshire.

Sir,—As an ardent motorist, and one who has recently had occasion to motor (by cycle and car) upwards of 2,000 miles in the county of Bedford, it distressed me to read in a recent issue of complaints about motor cyclists in that county. Unfortunately, I know these complaints are only too well founded; but when I met with a serious collision there with stray cattle a few weeks ago I found the utmost consideration and assistance from the superintendents of the county and town police.

Here is a county which, as you say, has no police controls, and ten-mile limits are unknown. On several occasions I have found the police most courteous to us motorists. Surely it is most unfortunate that advantage should be taken of their courtesy and consideration towards us by a few careless individuals.

I hope, by referring again to this matter in your largely circulated journal, you will be able to awaken a little more practical appreciation, which is due from some of my motor cycling brothers.

EDMUND A. JORDAN.

SIX PASSENGERS UP SUNRISING HILL.

A P.M.C. Motette climbing Sunrising with six passengers. The engine is a new 8 h.p. V type water-cooled pattern, and the feat, which took place last week end, was witnessed by "The Motor Cycle."

**A Throttle Valve Suggestion.**

Sir,—The "straight through" type of carburettor appears to be much in evidence at present, but, in my opinion, the throttle valves are not perfect, as a straight through draught is permitted only at full, or nearly full, throttle. I suggest that an iris diaphragm, such as is placed under the stage of every high-class microscope, would make a most efficient valve, as it could be very easily worked, and the throttle opening would be concentric with the bore of the inlet pipe at all speeds.

PETONE.

**Military Motor Cycling.**

Sir,—Your contributor "Celeriter" is inaccurate in the information which he gives with regard to the Kent Cyclist Battalion. Eastbourne not being in the county of Kent, the Kent Cyclist Battalion obviously cannot have a company there. There is no longer a company at Chatham. The present companies are as follows: Tonbridge, Farnbridge Wells, Bromley, Beckenham, Maidstone, Canterbury and Ashford, Folkstone, and Ramsgate.

F. W. HASSARD-SHORT, CHAPLAIN,

Kent Cyclist Battalion.

"Celeriter" is at present abroad, and, unfortunately, we have no means of communicating with him.—Ed.]

**Reliability of Counter-shaft Gears.**

Sir,—I own a 3½ h.p. Bradbury, to which I have fitted a Bowden counter-shaft gear, and these work exceedingly well.

The 8in. pulley on the counter-shaft greatly lessens the strain on the belt. I am using a Dunlop belt which has not been shortened since the gear was first lined up and adjusted, and which has since travelled about 1,500 miles.

I do not experience any belt slip in wet weather, as happens with smaller pulleys. With the Bowden gear I can start my Bradbury engine with the back wheel touching the ground on a very cold and frosty day (after injecting a little petrol into the exhaust cap), and then, by gently pressing back the pedal operator, engage the low gear and engine will take up the loaded sidecar and myself on almost any gradient. The free engine is beautifully free when running down hills or when one wants to stop for traffic.

I am not connected in any way with the Bowden or Bradbury Companies; I am merely expressing my satisfaction with gear and bicycle.

B. J. B. MARSDEN.

**Liverpool A.C. Open Hill-climb.**

Sir,—As a competitor in the open hill-climb of the Liverpool Auto Cycle Club on October 19th, I feel the club deserves a special word of commendation for the excellent way in which the whole thing was carried out.

The fact that the entry was a record one did not interfere with every climb being run off during a few hours. The bookkeeping was thorough and undisputed.

There was no confusion—obviously due to the thoughtful arrangement by which a position was allotted to each competitor before the start, and also to the sending of the riders from the top of the hill to the bottom by a circular route, so that during the three hours' climb no motor cyclist descended the hill.

The weighing at the top of the hill directly a man finished his ride was the obvious logical method.

Taking it all round, the whole thing was well done and reflects great credit on the club, and particularly on the organising secretary, Mr. Phillpott.

Another point much appreciated was the printed complete list of times and results, which reached every competitor a few days after the climb, so that even the unsuccessful ones were able to compare their performances with other unsuccessful ones.

FRANK WHITWORTH.

**Cyclecars.**

Sir,—I think many of your correspondents, who are making an outcry against the over-development of the cyclecar, fail to realise that, at present, it is uncertain to what class of people the cyclecar will appeal most. I consider that, roughly speaking, there are three markets open to this type of vehicle.

Firstly, there are ex-motor cyclists who wish for something fast, or almost as fast, and as handy as the motor cycle, but who, for physical or business needs, require slightly more comfort and luggage capacity, or the chance of taking a good ride or so with a passenger. To these the racy modern seated Bedelia or Rollo type will appeal.

Secondly, there are those who cannot afford a car, but who do not like motor cycles. These are suited by the comfortable middle-weight cyclecar, as the A.C. or G.W.K., or, perhaps, by something more luxurious still, like a water-cooled Singer. Whatever they choose, a high-class cyclecar, with its comparative low cost of upkeep and good workmanship, is a much better investment than a shoddy cheap car with its higher upkeep and shorter life.

Finally, the Colonies will open out, I feel sure, into an eager market for the right kind of car. Very often we see accounts in your contemporaries of the state of the roads abroad, generally accompanied by photographs of disconsolate motorists being dragged out of sand by horses. If, therefore, a cyclecar was built in a sensible way, and by that I mean designed, or an existing design improved, by men who have had bitter experience of colonial roads, I feel certain that, until the roads had been immensely improved, the cyclecar would oust the heavy car.

No car can be pared down in weight much without sacrificing strength, whilst the smaller cyclecar cannot be strengthened without sacrificing lightness. I think, therefore, that over most roads, or tracks, as they really are, a cyclecar, such as a special Colonial Singer, would hold its own with the average car, by reason of its comparatively light weight, general handiness, and lower upkeep. I must, I suppose, add the usual disclaimer that I have no interest whatsoever in the trade, and must mention that any names in this letter are to be taken as representing types, rather than makes, therefore, being absolutely impartial, I sign myself

AN ADMIRER OF ALL.

**Motor Cycle Taxation.**

Sir,—Taxation on means of locomotion is an absurd anachronism, but the imposition of a toll (or road rent) on road users, proportionate to the expenditure that they occasion, is obviously just, and probably expedient. Leaving for special treatment those true road hogs, iron-tired locomotives, also heavy carts and cattle, we find that vehicles wear down roads in proportion, firstly, to their weight; and secondly, to their speed. Propelling power is a convenient measure of both. Thus we arrive at the following scheme of tolls on road users: (a.) Tolls on vehicles "not over 5 cwt.," man propelled (handcart or bicycle), 2s.; horse propelled, 5s. per horse; mechanically propelled, 5s. per horse-power. (b.) If over 5 cwt., 2s. for every cwt. over 5 cwt. in addition. Thus, for example: (a.) The toll on a bicycle or handcart, 2s.; milk cart (1 horse), 5s.; 2 h.p. motor cycle, 10s.; 6 h.p. motor cycle, £1 10s. (b.) The toll on an 8 h.p. cyclecar (weight 8 cwt.), £2 6s.; 40 h.p. bus, etc. (weight 50 cwt.), £14 10s.; 60 h.p. motor car (weight 35 cwt.), £18. It

A competitor ascending Red Bank, Grassmere, in the A.C.U. Autumn Trial.

may be urged that this scale penalises the use of high powered engines. Is this any real objection? Surely, in view not only of the tender surface and tortuous nature of our roads, but also of the state of public feeling, it is wise to discourage high speeds. Police traps and perjury are odious to all. Why not try the above plan, which seems fair all round? To break the suddenly advanced demand on owners of heavy and high-powered vehicles, the toll for two years might be limited to 50% of the increased amount payable. Thus an 8 h.p. motor cycle pays at present £1 and would pay £2 under the all-round scheme. For the next two years the amount of toll might fairly be fixed at £1 10s. What do readers of *The Motor Cycle* think? H.K.P.

Sir,—At your invitation, I should like to enter a strong protest against any increase in motor cycle taxation. The two signatures enclosed are not of motor cycle owners, but prospective owners. In my own case, I have been on the look out for a good second-hand 5 to 6 h.p. with sidecar to take out the wife, who is engaged in very trying work. I cannot very well afford a new machine, but I thought probably I might get a decent second-hand for between £30 and £40. However, with the suggested increase in taxation I shall be entirely ruled out, and, as a matter of fact, must let the prospect of becoming an owner stand in abeyance until I see what really is to happen. A more unjust proposal I do not remember ever having come across. To think that a £20 second-hand bicycle should be taxed to the same extent as a £300 or £400 car seems to me to be at least preposterous.

A NEW READER OF *THE MOTOR CYCLE*.

Sir,—I am one of those who consider the new proposals are right. I was a motor cyclist in 1901, though I have not owned one for the last two or three years, so that I am not opposed to motor cycles as such.

If, however, I own an 8 h.p. car, I consider it unfair that an owner of a motor cycle and sidecar, who does about twice my speed, and half my petrol consumption, and who makes a noise that rends the firmament, should only pay £1 while I pay three guineas. Really the owners of 8 h.p. machines have had it their own way long enough. Everyone who does not actually own a motor cycle, or is a prospective owner, testifies them, and why? Simply because so many motor cyclists make beasts of themselves by riding through towns with free exhausts and tearing round corners. The craze for high speeds among motor cyclists is babyish. It is, however, fostered by certain manufacturers, and to a certain extent by the press.

Motor cyclists have shown the public no mercy, and they need expect none for all their squealing. Most people who drive horses and carts, when they hear of the new taxes, will say, "And a jolly good thing too."

It's the penalty for being a public nuisance.

P. W. MORRICE.

### Silencers.

Sir,—I was greatly interested in Mr. Aston's articles on silencers. There is, however, one point I should like to question if he will allow me to do so. Mr. Aston makes the statement, I believe, that the larger the expansion chamber the more efficient will be the silencer from the theoretical point of view. Now, it seems to me that in adopting this advice one may run into a rather interesting source of trouble.

Assume that it is possible to determine the actual shape of the peaky wave of pressure produced in the silencer by the escaping charge. This, as Mr. Aston suggested, might be carried out by means of a delicate manometer or pressure gauge inserted through the silencer wall at the chosen spot. Further, assume that we can obtain a series of such "peak" diagrams all along the passage of the exhaust from exhaust valve to open air at equal intervals. We are now in a position to ascertain exactly where and to what extent the peaks of the pressure wave become damped down.

Applying our apparatus to a simple long exhaust pipe we find that as we go along from engine to atmosphere the peaks die down at a practically uniform rate, as indicated in fig. 1, where six points of observation are shown. It will be noticed that close to the exhaust valve the length of wave is about equal to the time taken to drive the gas out of the cylinder, that is, half a revolution, whereas if the pipe be long enough the length of wave may become equal

Figs. 1 and 2.

this, that unless the length of wave of the gas finally issuing into the air is equal to the time between two explosions, the wave is not damped as well as it might be, and the silencer is capable of improvement from this point of view.

Now, consider a silencer with a large expansion chamber and comparatively small inlet and exit pipes, as shown in fig. 2. The effect of the chamber is to do in one fell swoop so to speak, all that the long exhaust pipe took the whole of its length to do. The short length of pipe 1, 2, 3, does not do much to damp down the peaks, and the waves of gas are hurled in a dangerously sudden manner into the comparatively low pressure space in the expansion chamber, with the result that a more or less violent explosive sound will be generated within the silencer at this point. This, in spite of the fact that the gas at the final exit may be coming out as smoothly as possible.

The solution of this difficulty seems to be the use of an exhaust pipe of gradually increasing diameter which will provide a chamber of greater volume than the average long pipe, and at the same time do away with this objectionable point of sudden expansion of the gases. Such an arrangement might take the form of that shown in fig. 3.

G. LAMBERT.

### Chivalry of the Road.

Sir,—Having read the letter of "A.C.S." re the above in your issue of October 17th, I should like to add my testimony. On October 9th I was riding my motor cycle near Rudyard Lake, Staffs., when I had a breakdown through magneto chain jumping the teeth and upsetting the timing. I had only just bought my machine and could not readjust the magneto, and, to add to my difficulty, it was pitch dark, being about 7 p.m. I looked like having a four miles walk pushing my machine, when, luckily for me, a gentleman passed on his cycle and called out to see if I was all right. He stopped his machine and set my timing right and also shortened magneto chain, thus preventing a recurrence of this difficulty. J.H.R.

## NEXT THURSDAY!

... FIRST SHOW NUMBER ...

OF  
THE  
MOTOR CYCLE

With special references to Sidecars, Runabouts, and Cyclecars.

SPECIALLY ENLARGED, ONE PENNY AS USUAL.

## THE ARIEL RUNABOUT.

Features: Twin-cylinder Water-cooled Engine. Wedge-shaped Radiator. Two-speed Sliding Type Gear.

**A**N exceedingly interesting cyclecar, which is built on somewhat unusual lines, is the 8 h.p. Ariel, the chassis of which is illustrated herewith. The motive power is an 8 h.p. water-cooled Precision V type engine, having a bore and stroke of 85 x 85 mm., cooled by a wedge-shaped radiator, consisting of gilled

change-speed lever. The gears are of the ordinary sliding type. The counter-shaft brake, as well as that on the rear axle, is of the 8 h.p. Rover type, and of very simple construction, consisting merely of a band wrapped round the drum, one end of which is anchored to the cross member of the chassis and the other to a rod connected to the brake pedal.

### Silent Chain Transmission.

The final drive from gear box to back axle is by means of a Coventry double roller chain. The drive is on the offside wheel only, but the near side wheel is provided with a friction device, consisting of a fibre disc on the outside of the hub, against which the hub is pressed by means of a powerful spring behind. This allows a certain amount of compensating action in turning corners. There is no axle casing, the axle itself revolving in large ball bearings, and behind it there is a tie rod serving to keep the bearings in line. The channel steel frame is somewhat peculiar in design, and its forward member serves as the front axle. As will be seen from the illustration, it is suspended on a large transverse spring, somewhat after the manner employed

Pan of new Ariel cyclecar chassis.

tubes. The circulation is on the thermo syphon system. The valves are mechanically operated. Gas is supplied to the engine by means of a Lukin carburetter, a carburetter which has proved itself to be very successful on cyclecars. It will be noticed that the engine is bolted to the frame by means of special brackets attached to the forward ends of the frame and to the first cross member. On the engine-shaft is a leather-faced friction clutch, and from engine-shaft to the gear box the drive is by means of a Coventry silent chain. The gear box, which contains two speeds and reverse, is

The Ariel cyclecar as it will appear when completed.

on Sizaire cars, while Lanchester springs are fitted to the rear wheels. The steering is particularly well carried out and is irreversible, being provided with a rack and pinion. The vehicle, which looks a thoroughly sound and satisfactory job, is the production of the Ariel and General Repairs Co., Ltd., Camberwell New Road, S.E. A comfortable torpedo type of body is provided.

Front view of Ariel cyclecar chassis.

1913 Roe two-speed gear and free engine unit with rear fork attachment.

Valve side of the new Henderson.

## AN AMERICAN FOUR-CYLINDER MACHINE

**W**E recently inspected the four-cylinder Henderson motor bicycle, 65 x 77 mm., 7 h.p., which Messrs. Robertson's Motor Agency, 157, Great Portland Street, W., will handle during 1913.

The engine is somewhat of a departure from standard practice, while the frame is distinctly out of the ordinary, since the bottom tube is in duplicate, and serves to carry the four-cylinder engine. The latter has four separate vertical air-cooled cylinders, with exhaust valves of the usual type and overhead inlet valves, operated by rockers and tappets. The inlet valve springs are external. The ignition is by Bosch magneto, protected by a metal case, and the advance and retard are effected by rotating the armature, by means of a worm gear in relation to the driving shaft, thus enabling the ignition to be varied over a large range, and allowing the spark to be of the same quality throughout this range, since the maximum position is not affected.

The lubrication is by drip feed to the crank case, and thereafter by splash to the big ends, piston, timing gear and

Sectional plan of induction pipe on the four-cylinder Henderson.

transmission gearing. The crankshaft is supported at three points, and at its after end is a bevel driven cross-shaft, on one side of which is fixed the chain sprocket, and on the other the folding starting handle.

### Cooling the Oil.

The crank case is a decidedly neat casting, divided up into compartments, so as to allow an ample supply of oil into which the big ends may dip. The joints are machined carefully, and steps are taken to ensure them being absolutely oil-tight. An interesting feature is that

radiating flanges are cast on the bottom of the crank case so as to ensure the oil being kept at a reasonable temperature.

The camshaft is a one-piece drop forging. The frame, as mentioned before, is of unconventional design. It is immensely strong, and is constructed of very heavy gauge tubing.

The carburetter is the Schebler or Breeze, types well-known in the United

The solid crankshaft which has a central bearing.

States. The petrol pipe is in duplicate one end of the pipe reaching to the forward end of the tank, the other to the rear, so that a continuous flow of petrol is ensured either when going up or down steep gradients. The automatic carburetter is controlled by twisting grips which are rubber covered and possess a ratchet, allowing the grip to stay in whatever position it is put without being held by the rider.

Chain side of the Henderson, an American four-cylinder machine.

### An Unusual Position.

The present model is fitted with a clutch of the multiple disc type. The somewhat curious appearance of the machine is due to the footboard forward of the engine. The rider is usually accustomed to sit with the engine between his feet, but in the case of the Henderson the rider's feet rest on the footboard well in front.

The machine is not ready for delivery, the model being only a preliminary one,

Operation of the magneto advance and retard.

and doubtless future models will be made to conform more closely to the wants of English riders.

Mr. Robertson Brown, of Messrs. Robertson's Motor Agency, allowed us to give the machine a short run in traffic, when we found it to be exceedingly smooth running and to possess an extraordinary amount of power. Although

fitted with a 4½ to 1 gear, Mr. Robertson Brown quickly attached a Mills-Fulford sidecar, and took us for a spin in the adjoining streets. The machine, though single-gear, started from standstill with the greatest ease, and showed itself capable of very quick acceleration.

# Lycett's new "LYSO" Belt

## WHAT IS IT?

—It is the *proved* World's Best Belt—of unique and exclusive design—made of pure Para Rubber and finest quality Cable, and is all that a perfect Belt should be.

## The genuine NEW "LYSO" Belt is marked "L. G. O."

in embossed letters on one transverse bar, position of which is about the middle of the Belt.

- It is skilfully manufactured.
- The Rubber will not crack nor grind away.
- The core is the strongest in the World—50% stronger than any other—and will not stretch nor pull out.
- By virtue of our Patent and Registered features embodied in "The New LYSO"—this Belt absorbs less engine power, is far more flexible, and is the fastest made.
- Here are a few of the host of successes on the new "LYSO"—part of the "proof":—

At BROOKLANDS: J. L. E. Emerson, on a Norton, won the Senior Tourist Trophy Race and broke the 100 miles, 2 hours, and 150 miles records. September 14th, 1912.

" " S. L. Bailey, on a Douglas, won the Junior Tourist Trophy Race and broke the 3 hours record. September 14th, 1912.

" " Championship Meeting. J. L. E. Emerson, on a Norton, won the Senior Hour Championship by over a lap, against all comers, thereby gaining "The Motor Cycle" Challenge Cup. October 12th, 1912.

" " F. W. Barnes, on a Zenith with sidecar, won the 1 Hour Championship Sidecar Race and broke the 1 hour, 50 miles, and 100 miles records. October 12th, 1912.

" " S. F. Garrett, on a Green-Precision with sidecar, broke the 1 hour, 2 hours, and 50 miles records, October 12th, 1912; and on October 12th 1912, he broke his previous day's records of 1 hour and 50 miles; Class C., 500 c.c., and secured third place in the Championship Sidecar Race. October 12th, 1912.

S. L. Bailey, on a Douglas, broke the flying 5 miles record. October 3rd, 1912.

IRISH "END-TO-END" RECORD: J. Stewart, on a 2½ h.p. Douglas, broke this record by 16 mins., covering 394 miles in 12h. 50m., thus beating the previous record, which was made on a 3½ h.p. machine. September 25th, 1912.

LIVERPOOL M.C. OPEN HILL-CLIMB, October 19th, 1912: F. W. Barnes FIRST in Class I. and Class X., and FIRST on time and formula in Class XII: J. J. Cookson FIRST in Class V.

And HARRY LONG ON HIS GREAT 20,000 MILES COAST RIDE IN 21 WEEKS on a Singer and sidecar with passenger averaged 3,600 miles per "LYSO" Belt.

## All used New "LYSO" Belts

—Obtainable of all Motor Agents or direct, LYCETT SADDLE AND MOTOR ACCESSORIES Co., Ltd., "The Saddlery," Bromley Street, Birmingham.

## The Buttertubs Pass (Yorkshire).

**T**O cross over the rugged moorland known as Abbotside Common—which is part of the Pennine Chain—from the village of Hawes in Wensleydale to Muker in Swaledale, motor cyclists and others proceed by that delightful road called Buttertubs, which is easier to surmount from the Hawes side than from Swaledale.

### Hardraw Scour.

Passing over the railway line at Hawes, bear to the left until a signpost directs to Muker. Here, however, one might deviate a little and visit Hardraw Scour, about half a mile away. It is a pretty little dell, with a fine waterfall, and well worth seeing, the best time being on a fine day after rain, for the best effects are then to be obtained. After spending a short time here a return should be made to the signpost, and turning to the left the climb commences.

### The Ascent.

The hill rises in steps with a few corners not really difficult, unless greasy. The hill starts well, but gradually increases in gradient and bad surface, until, after climbing for a mile or so, the engine getting nice and hot, a gate confronts the tourist, but, worst of all, immediately after the gate, the most severe gradient and surface has to be tackled from a difficult start. At the top a vast and glorious expanse of mountains and moorland looms up in the distance. It is, however, safer to allow the scenery to take care of itself until the traveller decides to stop and look around, for, although the road is fairly level, the surface is bad, and there is a sheer drop for the unwary on the left-hand. The road does not exactly run by a precipice, but once a start is made on this downward grade there is no chance of finishing safely. Further along the drop changes over to the right side, becoming at

the same time more precipitous and deeper. An attempt is now being made to save people from either walking or riding to destruction, but the attempt is somewhat feeble, only a species of railings being rigged up.

### The "Butter Tubs"

Just about where the drop turns from one side to the other a halt should be called, for at hand are the remarkable "Butter Tubs" from which the pass takes its name. These peculiarities of nature are deep fissures caused by the percolation of water, which has removed the soft limestone and left the hard stone in the form of basaltic columns upon which ferns and even trees manage to exist. Shortly after leaving the "Tubs" there is a short ascent, and from the road user's point of view this is practically the highest altitude, about 1,700 feet above sea level. The descent in Swaledale now commences, but it will be advisable to detail it as an ascent, for the descent presents no difficulties.

### The Swaledale Side.

Commencing practically at Thwaite the motorist has to encounter a long hard grind on bad surface, culminating in a turn to the left, and then a very severe gradient strewn completely over with loose stones. A right turn must next be negotiated, and then the hill is easy. A little further on a gate must be opened, but this should not cause any trouble. Leaving the pass near Thwaite, the run through Swaledale should on no account be missed, for passing along through Muker, Reeth, and on to Richmond, some of the finest scenery in Yorkshire can be enjoyed.

Either side of the pass should be climbed by any present day motor cycle, if geared fairly low because of the surface. A  $3\frac{1}{2}$  h.p. three-speeder with sidecar should be able to surmount the Hawes side of the pass without much difficulty.

H.W.F.

(1) A pretty view on Wensleydale, not far from Buttertubs Pass. (2) One of the fissures call "The Butter Tubs," from which the pass takes its name. The road is seen at the back, and immediately afterwards is a drop of some hundreds of feet. (3) The finish of the stiff climb on the Hawes side of the pass.

# Questions & Replies

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply.

## Remarkable Tappet Clearance.

I have an Ormonde with a Kelecom engine, built about 1900. (1.) In going up hills if the motor slows down should one retard the spark? (2.) Is 5 to 1 too high a gear for sidecar work with a 3 h.p. engine on moderate hills? I find that the engine will not take steepish hills of, say, 1 in 6 with a passenger. (3.) I have a small hole in my carburettor with a sliding cover made of tin. It is meant, I think, as an extra air inlet. Would opening this make any difference? (4.) Would fitting a first-class sparking plug give me more power? (5.) What should be the clearance of the valve tappets. The ones I have are adjustable, and I find that the engine will not start at all if the tappets have not got a clearance of nearly  $\frac{1}{4}$  in. This seems a great deal. If by dint of very hard work one does get the engine to start it will only go on a retarded spark. —S.M.

(1.) Yes; you should retard the spark if the engine labours on a hill. (2.)  $5\frac{1}{2}$  to 1 would be a more correct gear if you use a sidecar. You cannot expect the machine to take hills of 1 in 6 with a passenger unless a very low gear is fitted. (3.) Opening this might make a difference on hills, also closing it if the engine slows down at all. (4.) You would not find the fitting of a high quality plug would improve the power appreciably. (5.) The tappet clearance should be about the thickness of a visiting card. It is strange that the engine should not start if the tappets have not a clearance of  $\frac{1}{4}$  in.; such a clearance seems absolutely impossible. It is difficult in this case to see how the valves lift at all. We have, however, met with a similar case on the same make of engine. Evidently the engine should be retimed.

## Timing for Speed.

I should be pleased if you would assist me in trying to get more speed out of my 500 c.c. engine. Could you give me some speed timings to try? What has over-lap to do with speed? Would you explain the best method for tuning up a machine for fast work? Is a man in the trade who uses his machine for trade purposes bound to take out an Inland Revenue licence? If so, what cost? —B.E.

You are bound to pay the usual Local Taxation licence. Valve timings vary for different engines. Try exhaust valve opening with piston about 12 mm. from bottom and closing 1-2 mm. down. Inlet opening 2 mm. down and closing about 5 mm. up. This may necessitate new cams, and be hardly worth your while, as it may not prove the best setting for your engine.

Valve timing is largely a matter of experiment for each type of engine, and you would possibly have to make several cams before the best speed results were obtained. Keep your magneto platinum points clean and level and adjusted on the close side. Try stronger valve springs. A well-balanced engine is essential for speed work. Over-lap in valve timing is only advantageous on some engines, though in actual practice the valves of nearly all engines over-lap at high speeds owing to the inertia of the valves which prevents them following the cam contour, and thus they do not shut quite at the instant one would expect.

## Valve Timing and Magneto Timing.

(1.) What should be the position of the piston when the exhaust and inlet valves open and close (stroke  $\frac{3}{4}$  in.)? (2.) What should be the position of the piston when the magneto contact breaks, and where should the lever of the magneto be? (3.) The crank case leaks oil. Is shellac varnish smeared on the joints before putting together a preventive? (4.) I have run about 100 miles and carbonisation on the top of the piston has taken place in a large quantity. I have run with both levers

Correspondents are urged to write clearly, and on one side of the paper only, numbering each query separately, and keeping a copy, for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

on the handle-bar nearly closed; that is, the secondary air has been completely turned off. The engine heats up and refuses to take hills. There is a Mixa fan in the inlet pipe, and the number of the jet is 32, and was recently supplied by Brown and Barlow, the makers of the carburettor. I have put a pressure gauge over the exhaust valve cap, and this vibrates up to 50-60 lbs. per square inch compression when the bicycle is pedalled round, and above 100 lbs. per square inch when the engine is run. What should the compression be? —A.H.

(1.) Set your exhaust valve to close when the piston is dead on the top of the stroke. The exhaust valve should begin to open when the piston is one-seventh of the stroke, i.e.,  $\frac{1}{7}$  in. from the bottom of the firing stroke. The inlet valve begins to open when the piston is  $\frac{1}{2}$  in. down from the suction stroke, and closes when the piston is commencing to rise on the firing stroke. (2.) You should time the magneto so that with the lever retarded the points should be just about to break when the piston is dead on the top of the stroke. (3.) To cure the crank case leaking of oil you might try a washer of brown paper soaked in boiled linseed oil; or, before putting it together, paint the joint with Coverol or Jointilac, sold by the accessory houses. (4.) The fault here, we should say, is in your driving, as if you drive with the air closed you tend to make the engine overheat and soot up. You might try removing the fan from the inlet pipe. A compression of about 60 lbs. is right. Do not attempt to use the gauge on a single-cylinder with engine running.

The Wall tricycle is becoming exceedingly popular as a trade vehicle

## Motor Cycle Insurance.

Is damage caused by sideslip (or anything else) covered by a motor insurance policy? I was riding close to the left hand kerb of a main road tram route: near kerb very dry, tram sets very greasy. A motor van came out of a left hand, little used, side street. I did not sound horn; nor did the van, according to myself and a voluntary witness. My speed was 5 m.p.h., van speed 10 m.p.h. To avoid being killed I had suddenly to swerve on to tram route but skidded on the lines. Result, a damaged belt rim that would not revolve between forks. I sent to my motor insurance company a claim form with particulars, but added, unless anything further developed, I should make no claim if it did not cause belt slip after straightening as well as I could. A new rim would cost 7s. and present loss of use of cycle, but I should lose 4s. bonus through making a claim at all this year. I think readers should be warned on this point in their policies. Copy of "accidental damage" clause in motor cycle insurance policy: "That the company shall indemnify the assured by repairing, or paying the cost of repairing, any damage caused by external accidental impact to any motor vehicle (including accessories, lamps, and tyres actually fitted to such motor vehicle) belonging to the assured and described in the schedule hereto, but only to the extent of the total sum of £30." Schedule referred to: 3½ h.p. 1910 Triumph, value £30, registered letter and number F 3808. I append the insurance company's reply: "We are obliged for your letter and also the claim form you sent in connection with some damage sustained to the belt rim of your motor cycle. We note the particulars you give, but, of course, in view of the fact that your machine had no actual impact this damage would not be covered by your policy. We see that in any case you, for the moment, make no claim, but we give you the above information in case something further develops in connection with the belt rim.—Yours faithfully, for the — Insurance Co. General Manager."

I should be grateful for an early reply, not that I am likely to press any claim, but I think the insurance company should be told my view of the case, as it appears to me a flagrant disclaimer of liability—and that from one of the principal insurance companies.—F 3808.

Our legal adviser writes as follows: "I have perused the letter from 'F 3808' enquiring whether damage caused by a sideslip is covered by an insurance policy containing the clause he sets out. I am assuming that there is no other clause in the policy affecting the matter, though it would be advisable to look carefully through the conditions, as there may be a clause directly excepting damage due to mechanical breakdown, bursting tyres, deslips, etc. There is also, in all probability, a clause providing that any dispute is to be referred to arbitration instead of being settled in the law courts. Failing such clauses, I consider that your correspondent could recover any damage sustained through sideslip in the particular circumstances. His claim would be much

stronger than in an ordinary case of sideslip, as it was caused through his endeavouring to avoid a collision with another motor vehicle, and the impact with the greasy tram route was therefore undoubtedly accidental. In all cases of sideslip there must be an external impact with the greasy surface, but the policy uses the words 'external accidental impact.' With regard to recovering on the ground that the impact is external, I think there can be no doubt as to this, nor can there be any doubt as to the sideslip being an impact. The insurance company would probably contend that a sideslip is not an accident, but, personally, I think they would not succeed in this. I cannot find any decided case dealing with the point precisely, but the meaning of the word 'accident' has been very fully gone into in recent years in connection with the workmen's compensation cases, and the leading case reached the House of Lords in 1903. In that decision, which dealt with the question of a workman rupturing himself by an act of over exertion in turning a wheel, Lord Macnaghten said that the expression

The Garrard Maxfield instantaneous sidecar coupling. The top illustration shows it open, and the bottom one closed.

'accident' is used in the popular and ordinary sense of the word as denoting an unlooked-for mishap or an untoward event which is not expected or designed. In the same case, Lord Lindley said that an accident meant any unintended or unexpected occurrence producing hurt or loss."

## Starting Difficulties.

(1.) The 3½ J.A.P. engine on my 1911 Zenith has taken to knocking very badly at slow speeds with spark advanced, and I find that both big and little ends are loose and really want rebushing. As I only had the big end rebushed after having run 2,200 miles, I do not want to go to the expense of having it done again so soon. Do you consider there is any real danger, if it be left alone, of the connecting rod or anything else breaking? (2.) Can you suggest any really good tip for starting a motor cycle (e.g., Zenith) which has to be pushed along on a cold early morning when the oil has got gummied up? I am often half an hour starting—injection of petrol, all mixtures, changing plugs, cleaning platinum points, etc., being often of no avail. It seems merely due to the lowness of the temperature. I have heard of a tip of taking the connection out of the magneto and injecting petrol right into the heart of the magneto.—H.S.M.

(1.) The bush should not have gone so quickly as this. We are afraid you must have it replaced, and we should recommend you to go to the extent of seeing

that it is properly fitted this time, and that oilways are cut so that it has every chance of getting sufficient lubrication. (2.) Take care to see that there are no leaks in the carburettor unions. You might try putting a cork in the fixed air inlet of the carburettor, with a small hole in it, so that you can restrict temporarily the air supply, removing the cork the moment the engine has fired. Do not attempt to use the tip you have mentioned as regards the magneto. Try a thinner oil in winter.

## READER'S REPLY.

## Mysterious Misfiring.

I have had the same trouble as "C.E.T." with my machine—a 1907 Triumph—on one occasion, and as I got completely over my fault, which may possibly be the same as "C.E.T.'s," I may, at all events, put him on the track. (1.) The lift of the exhaust valve was not sufficient. When going faster than about 20 m.p.h. there was not time for the burnt gases to escape, leaving a slight pressure behind at the moment the inlet valve opens, causing a slight throw-back through carburettor, and also a bad mixture which does not spark well. When the spark occurs a second time, the mixture being now clear and no pressure of spent gases, I get an explosion every other spark. (2.) As the speed increases the voltage of the current given out by the magneto rises. Now, suppose somewhere on the high tension circuit there was a point where the insulation resistance was not much more than the air gap at plug points. As the voltage rose this other gap would also be bridged and very much affect the sparking. My fault was worn insulation of the carbon brush holder. The magneto was sparking through to the frame at higher speeds. A little rubber composition insulation, applied, put the matter right.—G. A. Bishop.

"C.T.B.," Alford, Lincs., and others will receive replies to their queries if they send stamped addressed envelopes.

## EXPERIENCES WANTED.

"F.J.T." (Camden Town).—Mead motor cycle, reliability.

"C.W." (Portsmouth).—Roc two-speed gear. Consumption of 5 h.p. twin Roc.

"J.H.W." (Birmingham).—5 h.p. A.J.S., with and without sidecar.

"R.W.S." (New Southgate).—A.C. Sociable. Reliability, skidding, comfort, control, cleanliness of engine, and cooling.

"N.G.G." (Cambridge).—5-6 h.p. Clyno, with sidecar. Reliability and efficiency.

"Ajax" (Kent).—1912 6 h.p. Matchless-Jap. T.T. and touring models; six speeds and ordinary two speeds.

"C.R.W." (Brighton).—8 h.p. Williamson sidecar.

"W.R.H.C. (Nantwich).—Morgan run-about. Consumption and life of rear tyre.

"H.R.D." (Somerset).—Morgan run-about rear tyre wear and skidding propensities, reliability, and running costs.

"J.F.T." (Suffolk).—Binks two-jet carburettor on Matchless sidecar.

"C.C.C." (Dawlish).—3½ h.p. Ivy Precision.

"T.H." (Normanton).—1911 3½ h.p. two-speed Humber with sidecar.

### Hoods for Cyclecars.

The Dulwich Hood and Screen Works inform us that the hood illustrated on page 1207, October 24th, can also be supplied for cyclecars.

### Lamps in the Colonies.

Samuel Hall and Sons, Wrottesley Street, Birmingham, inform us that they have arranged sole agencies in South Africa and New Zealand. They have also fixed up in three States in Australia and one State in India. Where arrangements have not been made the firm is open to hear from other importers.

### Lamp Manufacturers' Successful Year.

Joseph Lucas, Ltd., Birmingham, after paying 5% on the preference shares have declared a dividend of 15% on the ordinary shares. £15,000 has been placed to reserve and £13,774 7s. 4d. has been carried forward. The total net profit for the year after due provision for depreciation amounts to £42,899 7s. 4d. The subscribed capital is £200,000.

### Leakage through Generator Filler Cap.

Being continually troubled by water pouring from the filler cap of the generator on one of our machines, which covered the tank with drops and rusted all the plated

A home made generator cap.

fittings within its reach, we sought a means of overcoming the difficulty, and completely cured the trouble by soldering a short piece of copper pipe on to the base of the filler cap and plugging the end with the head of a brass rivet, which was soldered on to the bottom. Two holes were then bored in the position shown. The dotted line shows the shape of the interior of the cap, which rendered it of such a

nature that the water forced itself up the dome and leaked out freely through the hole at the top until the tank had emptied itself to a certain level.

### Tyres in Competition.

R. Charlesworth, competing in the Herts County A.C. third quarterly trial, won the slow hill-climb in Class C (twins) and the private owners' silver cup. He used a cover on the driving wheel of his 6 h.p. Zenith made by W. and A. Bates, Leicester, which had done 2,000 miles, mostly with a sidecar. We understand that there is still plenty of rubber on the tread, and the tyre looks like doing another 2,000 miles.

### Motor Cycle Saddles.

A case of some interest was decided recently by the Comptroller-General in regard to saddle patents. J. B. Brooks and Co., Ltd., entered two oppositions to the patents relating to the XL'All anatomical steel base saddles, and requested their entire rejection on the ground that their features were old and well-known at the date of application. The decision of the Comptroller-General was to seal patents both for the pan seat or anatomical top and the parallel springing of rigid top saddles. Further developments of this litigation may be expected.

## SPARKLETS

### Storing in Cambridge.

Mr. King, of King and Harper, Bridge Street, Cambridge, who formerly made a motor bicycle bearing his name, and is well-known to Cambridge motor cyclists, has greatly enlarged his premises, and is now storing 150 motor bicycles. Mr. King caters for cars and motor cycles, and the smaller vehicle is never neglected.

### A Sidecar Hood.

An excellent sidecar hood is that made by the Capital Screen and Hood Co. It is a copy on a small scale of the ordinary two-seated car hood, and is made of strong double texture twill and has a celluloid window at the back. It should prove a serviceable fitment. It is shown in the illustration below.

The "Capital" sidecar hood fitted to a Matchless.

### Trade Announcements.

The City Ignition Co. advise us that during the period of the Olympia Motor Cycle Exhibition they will exhibit their specialities at 4, Beaconsfield Terrace Road, facing the back entrance to Olympia.

### Trade Notes.

Mr. W. Earl, late foreman of the F.N. Repair Works, informs us that he has re-opened the premises at Kelvin Road, Highbury, N., recently vacated by the F.N. Co., and is specialising in repairs to these machines.

Mr. A. Alderson, who has acted as designer for eight years for Singer and

### "The Motor Cycle" Photographs.

Orders, which must be accompanied with remittance, should be addressed to the Photographic Department—Iliffe and Sons Limited, 20, Tudor Street, London, E.C.

Co., Ltd., and the Singer Motor Co., been compelled, owing to failing eyesight to resign his position. He has been recommended to adopt an outdoor life, and in future take up a line of business which will not entail so much strain on eyesight.

### "Tracing Troubles."

The above is the title of a new book published by Iliffe and Sons Ltd. London and Coventry, and is obtainable from *The Motor Cycle* Offices, 20, Tudor Street, E.C. It is intended to assist motor cyclists to identify faults in the running of their machines, and to remedy them with the least delay. The manual has been prepared on the same lines as Mr. J. S. V. Bickford's automobile manual and is arranged as follows: the reader knows what is the matter with his machine, he begins with the index at the end of the book, hunts up the trouble there, and looks up the paragraph directed. If he does not know what the matter, he turns to Section I., which consists of numbered tables. As an example, if the engine will not start, hints regarding this will be found in No. 1 table. If it runs badly, but without stopping, No. 22 will probably give

the reason of the trouble, and if it stops altogether, table 95 will suggest a remedy for the fault. The book is priced at 1s. net, and can be obtained, post free, for 1s. 2d. It is edited by "Road Rider," the compiler of "Hints and Tips for Motor Cyclists," and will be found useful even to the most experienced riders.

### "Complete Hints and Tips for Automobilists."

The fifth edition of this work, which has been thoroughly revised by the staff of *The Autocar*, is now ready. All hints and tips which have become obsolete have been eliminated, and others, giving information with respect to the latest types of cars, have been inserted in their place. Many owners of motor cycles are also owners or prospective owners of motor cars and will be interested in a book of this sort. Among the various chapters are such articles as overhauling a car in a private garage, tuning up a car, what to do with a new car, etc. The book is full of excellent illustrations, and the price, post free, is 2s. 10d. Copies are obtainable direct from *The Motor Cycle* Offices, 20, Tudor Street, E.C., or from leading booksellers.

# SERVICE BELTING SAVES BOTHER

**BRITAIN'S BEST.**

The belt that will not slip, but always grips. Ideal for wet and winter work.

**Extract from A.C.U. 6 Days' Trial Judge's Official Report.**

"... I would also mention as having gone through the trials in a most satisfactory manner, the set of Service leather belts (set No. 7), entered by the Service Co., Ltd., and carried on Mr. W. B. Little's one-cylinder 3½ h.p. Premier motor cycle. In all these sets of belts one belt only was used, and in each case only one piece required to be cut off the belt. At the conclusion of the trial they were all in a perfectly serviceable condition, and apparently good for use for many more miles."

London, N.W., 21/10/12.  
"I beg to inform you that I have climbed Arms Hill, Henl y, on my 3½ h.p. Swift, with Sidecar and passenger. The machine was in full touring trim with heavy lamp, generator, and tool bags for 14 tools and spares, weight of machine and passenger 568 pounds. The machine is the same as I used in the 6 Days' Trial. The hill was very greasy, there being some rain over-night. However, I did not rope back wheel as I used a steel-studded Hutchinson and a Service Belt."—Yours faithfully, F. J. W.

MORECAMBE.**

Telephone 112. Wires—Hitchen's Ltd., Morecambe.

## A BALL BEARING

is a delicate mechanism, and the finely finished surfaces of the balls and races are quickly ruined by wet and grit which soon work in when the motor cycle is ridden in wet weather.

HUB LUBRICANT is recognised as an ideal lubricant for ball bearings. Its special value, however, is in the protection that it affords against the ingress of wet and mud.

HUB LUBRICANT is easily injected and it stays in and keeps wet out.

Hub lubricant is now being generally adopted for bottom bracket two and three speed gear boxes such as Bowden, Clyno, Douglas, Chater Lea, F.N., Bradbury, and James. It is quite different to the usual gear grease

Write for H. L. literature and 1913 Lists to—

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 14 words or less 1/6, and 1d. per word after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To insure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

### SECTION I.

Northumberland, Cumberland, Durham, and Westmorland.

### SECTION II.

York and Lancashire.

### SECTION III.

Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

### SECTION IV.

Nottingham, Lincoln, Leicester, Rutland, Northampton, Warwick.

### SECTION V.

Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

### SECTION VI.

Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

### SECTION VII.

Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, Channel Islands.

### SECTION VIII.

Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

### SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

### SECTION X.

Scotland.

### SECTION XI.

Ireland and Isle of Man.

Phone: 5777 Holborn.  
Wires: "Opifcer, London."

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration, and three stamped and addressed envelopes must be sent for forwarding replies. Only the number will appear in the advertisement. Replies should be addressed, "No. 000, c/o 'The Motor Cycle,' Coventry"; or if "London" is added to the address, then to the number given, c/o "The Motor Cycle," 20, Tudor Street, E.C.

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding 10 in value, a deposit fee of 2s. 6d. is charged, when under to the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Hiffe & Sons Limited.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

# The CLYNO

## Specially designed for SIDECAR WORK

The remarkable success of the CLYNO is due to the fact that it is designed and built for passenger work. It has shown its mettle in the most severe Trials of 1912, having secured highest awards and many special . . . .

### SIDECAR PRIZES,

including the Colmore Cup in the Midland Open Reliability Trial, the Sidecar Prize in the M.C.C. London-Land's End Run, and the Well's Cup, and the Clark Cup in the M.C.C. London-Edinburgh Run.

### Two Recent Successes :

In the Liverpool M.C.C. One Day Trial, the CLYNO and SIDECAR was the only passenger machine to make a non-stop run.

In the A.C.U. One Day Autumn Trial, the CLYNO and SIDECAR put up the best performance by a passenger machine.

**Don't hesitate, buy a CLYNO for 1913.**

Stand No.  
**122**  
Olympia.

**PELHAM STREET, WOLVERHAMPTON.**

There will be many things to interest you at the SINGER STAND—OLYMPIA, November 25—30.

For instance, there will be staged a complete range of our 1913 Motor Bicycles, varying in horse-power from  $2\frac{1}{2}$  to 4, and every model characterised by that refinement and distinctiveness which has ever been associated with the Singer name.
